Abosso Mine 303
Accidents and Their Prevention, Coal Mine.....
.....J. A. Holmes.... 673
Insurance and Mine .....W. H. North.... 163
Advertising, Fifty Years of.....L. A. Greene.... 731
Africa, Star of the Congo Mine..... 260
Agassiz, Alexander .....Editorial.... 514
Agitation, Methods of Pulp.....Lloyd M. Kniffin.... 824
Air by Water, Compressing ....George C. McFarlane.... 281
Air, Oil Heater for Compressed..... 929
Pressure, Tunneling Under 832
Ajuchitlan, Queretaro, Mexico, Mines of.....
.....Samuel J. Lewis.... 211
Alamos-Promontorios District.....T. P. Brinegar.... 553
Alaska Coal Land Values.....Editorial.... 345
Copper Deposits of Prince William Sound.....
.....U. S. Grant.... 63
Dredging at Nome in 1909..Special Correspondent.... 47
Early Opinion of.....William P. Blake.... 730
Explosion at Mexican Mine.....Editorial.... 382
Ditto .....Robert A. Kinzie.... 423
In 1909, Mining in..... 27
Pony Dredges in.....William H. Washburn.... 352
Railways and Coal in..... 638
Rush to Iditarod 851
Alaska, Reclaiming Flooded Drift Mines in.....
.....W. H. Lanagan.... 892
Alaska Mexican Gold Mining Co....Company Report.... 851
Alaska United Gold Mining Co.....Company Report.... 782
Alaskan Coal, Conservation and.....H. Foster Bain.... 185
Alleghany, California, Mining at.....F. L. Lowell.... 132
Allison, E. L.....Conservation and Some Difficulties.... 262
Amador County, California, Mining on the Mother Lode
in .....William H. Storms.... 897
Amalgamated Copper Co.....436, 498
'Malgamatin' 750
Amalgamation, Methods of Electrochemical.....
.....Elmer Ellsworth Carey.... 394
Pebble-Mill .....H. W. Hardinge.... 608
Trap .....H. S. Reed, Jr.... 297
Americans and Chinese Railways.....Editorial.... 921
American Institute of Mining Engineers and Canadian
Mining Institute .....Editorial.... 445
Mining Law .....Editorial.... 707
Shipping, Oriental Trade and.....Editorial.... 208
Ditto .....Edward P. North.... 494
Ditto.....Thomas T. Read.... 227
Amparo Mining Co.....239, 621, 874
Anaconda Copper Company 335, 467
Ditto .....Editorial.... 788
Anaconda Merger 509
Analyses, Sources of Error in.....R. C. Benner.... 492
Analysis of Rocks 647
Analytical Methods, New.....F. H. Mason.... 683
Ancient Wire Rope 785
Anderson, Isaac.....Regenerating Copper Cyanide
Solution 229, 803
Anglo-Malkop Corporation 624
Anniversary, Earthquake .....Editorial.... 575
Our 792
Annual Cyanide Letter, Alfred James'.....
.....E. M. Hamilton.... 328
Ditto .....Alfred James.... 41
Ditto .....Ralph Nichols.... 495
Ditto .....John M. Nicol.... 328
Ditto .....M. W. von Bernewitz.... 803
Labor Pending Patent Proceedings.....
.....H. W. MacFarren.... 800
Application for Patent 802
Appoint a Trained Man.....Editorial.... 634
Appointment, Bureau of Mines.....Editorial.... 818
Appropriations for Geological Survey and Bureau of
Mines .....Editorial.... 884
Aqueduct Tunnel Work, Los Angeles..... 681
Argall, Philip H.....Metallurgical Progress in
Colorado 35, 362
Argonauts .....Joaquin Miller.... 746
Arizona Commercial Co..... 333
Cost of Drilling at Miami.....William G. Weber.... 861
Geology at Globe .....F. L. Ransome.... 256
Ditto .....C. F. Tolman, Jr.... 327
In 1909, Copper in.....C. F. Tolman, Jr.... 71
Arizona Gold Mines Co..... 232
Armstrong, L. K.....Coal-Land Prices.... 650
Ditto.....Idaho, Oregon, and Washington in 1909.... 19
Army Engineers, Reclamation and.....Editorial.... 634
Arroyo District, Masbate..... 388
Artesian Wells 938
Asia, Gold Mines of Tibet.....Alexander Del Mar.... 254

Page.

Ashanti Goldfields Corporation, Ltd.....231, 501
Assay for Prospectors, Wet Gold..James W. Howson.... 936
Assay of Gold-Silver Cyanide Solutions.....
.....Theo. P. Holt.... 863
Assay, Wet Gold.....Robert DeLuce.... 895
Terms, Standardization of..... 418
Associated Oil Company..... 685
Atomic Weight of Chlorine.....F. H. Mason.... 930
Atomic Weights, Revised.....F. H. Mason.... 30
Aurora West 653
Austin, L. S.....Coarse Crushing at the Boston
Con. Mill at Garfield, Utah..... 123
Ditto ....Fifty Years of Smelting in the Western
States 753
Ditto .....Housing Conditions at the Garfield
Smelter 577
Australia and Elsewhere, Patents in.....Editorial.... 248
Premier Tin Mine.....John Plummer.... 820
Radium in .....John Plummer.... 292
Stoping Methods at Kalgoorlie.....J. Cheffirs.... 391
Australian Gold Production.....J. W. Bush.... 327
Mining Regulations 863
Aviation, Mining and.....A. E. Berriman.... 790
Aymé, Louis II.....Mining Industry of Portugal.... 870

B

Backward, Looking .....H. F. Dexter.... 747
Badger, H. Ralph.....Electric Drill-Sharpeners.... 588
Bain, H. Foster.....Conservation and Alaskan Coal.... 185
Ballinger and the Cunningham Claims.....Editorial.... 885
Ditto.....Matte Smelting at Denver.... 250
Batteries, Limitations of One and Five Stamp.....
.....Algernon Del Mar.... 640
Bear Creek Dredge, Work of the..... 852
Becker, G. F.....Edmund Halley.... 478
Belting, Keeping Shop Records of..... 700
Benner, R. C.....Sources of Error in Analyses.... 492
Berriman, A. E.....Mining and Aviation.... 790
Bill, Bureau of Mines..... 804
Bit of History.....Charles G. Yale.... 861
Bits, Rock Drill.....T. H. Proske.... 347
Blake, William P.....Early Opinion of Alaska.... 730
Ditto .....Editorial.... 788
Blatchley, Raymond S.....Indiana Oilfields in 1909.... 99
Ditto .....Petroleum in Illinois in 1909.... 101
Boleza Gold Mines in Hungary.....Newton B. Knox.... 31
Boleo Copper Co..... 941
Bone-Ash Cupels, Cement v.....J. W. Merritt.... 619
Boosting California .....Editorial.... 851
Boston Con. Mill at Garfield, Utah, Coarse .....
Crushing at the.....L. S. Austin.... 123
Bradford, Robert H.....Utah's Mines, Mills, and
Smelters in 1909 76
Bretherton, S. E.....Engineer and His Report.... 650
Bridges, Long-Span Concrete 891
Brinegar, T. P.....Alamos-Promontorios District.... 553
Brinsmade, R. B.....Coal Land Prices.... 618
Bristol, J. J.....Plotting Co-ordinate Surveys....487, 524
British Columbia .....E. Jacobs.... 73
British Columbia Copper Co., Ltd...Company Report.... 411
British South Africa Co..... 563
Brock, R. W...Prospecting, Developing, and Mining.... 860
Broken Hill Proprietary, Ltd.....Company Report.... 699
Buckets, Miniature Excavating 668
Special Risdon Dredge..... 246
Building, Geological Survey.....Editorial.... 544
New Mining 680
Bullfrog District, Nevada, Faulting in the.....
.....W. H. Emmons and G. H. Garrey.... 931
Bullfrog, Ore Deposits at..... 527
Pioneer Leasing & Milling Co.....301
Bullion-Tax Law in Nevada.....Bullion-Tax Payer.... 134
Bunker Hill & Sullivan Litigation Settled..... 683
V. Federal Mining & Smelting Co.....
.....Company Report.... 176
New Concentrator of.....Gelasio Caetani.... 120
Bureau of Mines Appropriations.....Editorial.... 884
Bureau May Do, What a Mining .....Editorial.... 515
Of Mines .....Samuel B. Christy.... 530
Of Mines Again.....Editorial.... 4
Of Mines Appointment.....Editorial.... 818
Of Mines Bill 467, 658, 804
Burner, New 380
Burnett, Archibald.....Qualified Mining Engineer.... 460
Burrows, R. H.....Prospecting in Chihuahua.... 392
Bush, J. W.....Australian Gold Production.... 327
Butte Central Copper Co..... 168
Butte, Labor Troubles at.....Editorial.... 314
Butte Mine Production 915

C

Page.

Cachani Mines, Ecuador.....H. P. Gordon.... 486
Caetani, Gelasio.....New Concentrator of the Bunker Hill & Sullivan 120
California and Mining, University of.....Editorial.... 671
Boosting .....Editorial.... 854
Coalinga Oil District..... 752
Early Mining in.....Joseph McGillivray.... 738
Eight-Hour Law.....J. E. Collie.... 295
Ditto .....Editorial....2, 84
Eight-Hour Law, Supreme Court Dicision on..... 113
Gold Mining .....Occasional Correspondent.... 17
Guadalupe Quicksilver Works.Courtenay De Kalb.... 446
Hoag District .....Norman C. Stines.... 381
Hydraulicking in.....H. P. Gordon.... 751
In 1909, Oil Industry in....Special Correspondent.... 97
Lake View Gusher 925
McKittrick-Sunset Oil Region..... 641
Mining at Alleghany.....F. L. Lowell.... 132
Mining Debris in..... 607
California, Mining on the Mother Lode in Amador County .....William H. Storms.... 897
Oil Industry .....Courtenay De Kalb.... 857
Petroleum in 1909..... 161
Quicksilver in.....Occasional Correspondent.... 15
Stamp-Mill .....Courtenay De Kalb.... 736
Tourmaline in.....John L. Cowan.... 864
Calumet & Arizona.....Company Report.... 664
Camp Bird, Ltd.....140, 402
Ditto .....Editorial.... 118
Campbell, R. H.....Long-Tom and Hydraulic Mining in California 934
Campbell, E. DeM. and Charles E. Griffin..... Volumetric Estimation of Uranium and Vanadium 160
Camping with the Geologists....Dennis H. Stovall.... 684
Canadian Mining Institute and American Institute of Mining Engineers .....Editorial.... 445
Meeting 821
Toronto Meeting .....Phillips Thompson.... 457
Cananea, Reverberatory Smelting at.....Editorial.... 279
Cape Copper Co., Ltd..... 195
Carbon and Cellulose in Cyanide Solutions..... .....A. J. Clark and W. J. Sharwood.... 554
Carey, Elmer Ellsworth....Methods of Electrochemical Amalgamation 394
Carn Brea & Tincroft..... 433
Carnegie Foundation .....Editorial.... 670
Carpenter, Jay A. .....Kimberly, Nevada.... 482
Ditto .....Mining in Nevada for 1909.... 66
Carter, Hubert A....Electric Drive in Foundries, Works, and Mines 215
Cascades, The Northern .....Horace F. Evans.... 448
Case Hydro-Carbon Burner..... 380
Cellulose in Cyanide Solutions, Carbon and..... .....A. J. Clark and W. J. Sharwood.... 554
Cement v. Bone-Ash Cupels.....J. W. Merritt.... 649
Centrifugal Pumps, Efficiency of.....F. W. Kerns.... 862
Cerro Gordo, Early Smelting at.....Francis Drake.... 745
Chainman Mill, Ely, Nevada..... 587
Channing, J. Parke.....Mining Investments.... 210
Channing on Mining Investments....Percy Williams.... 264
Cheffirs, J.....Stoping Methods at Kalgoorlie.... 391
Chemical Industries, Relation Between Mineral and.... (I, II) .....George T. Holloway....424, 450
Chief Consolidated Mining Co..... 774
Chihuahua, Prospecting in.....R. H. Burrows.... 392
Sinaloa and Western.....G. L. Sheldon.... 58
Chile in 1908 and 1909, Mineral Production of..... .....F. A. Sundt.... 802
Nitrate of Soda Industry of (I, II).S. H. Loran....125, 180
Chinese Railways, Americans and.....Editorial.... 921
Chino Copper Co.....809, 937
Chlorine, Atomic Weight of.....F. H. Mason.... 930
Christy, Samuel B.....Bureau of Mines.... 530
Cinnamon Bippo Co., Ltd..... 231
Clark, A. J. and W. J. Sharwood.....Carbon and Cellulose in Cyanide Solutions..... 554
Clark, Edwin M.....Smelting Copper in Small Reverberatory Furnaces 579
Clarke, S. S.....Southeast Missouri Mining.... 528
Classification of Igneous Rocks.....E. R. Rice.... 901
Classification of Mexican Onyx, Genesis and..... .....E. M. Lawton.... 791
Clay Deposits, Prospecting and Testing of..... .....E. K. Soper.... 827
Clemens, Samuel L.....Editorial.... 604
Coal, Conservation and Alaskan....H. Foster Bain.... 185
In Alaska, Railways and..... 638
Land Prices .....L. K. Armstrong.... 650
Ditto .....R. B. Brinsmade.... 618
Ditto .....Editorial.... 476
Land Prices Again.....Editorial.... 635
Land Progress .....Editorial.... 476
Land Values, Alaska.....Editorial.... 345
Land Withdrawals 615

Mine Accidents and Their Prevention.J. A. Holmes.... 673
Miners' Striks .....Editorial.... 574
Mines, Philippine 323
Mining and Coke Making at Dawson, New Mexico..... .....E. W. Parker.... 559
Mining in the Middle West ..George H. Cushing.... 130
Coalinga Oil District, California..... 752
Coarse Crushing at the Boston Con. Mill at ..... Garfield, Utah.....L. S. Austin.... 123
Coeur d'Alene Litigation Settled..... 638
Snowslides in the .....Editorial.... 344
Coke and Iron in the Middle West..... .....George H. Cushing.... 21
Making at Dawson, New Mexico, Coal Mining and..... .....E. W. Parker.... 559
Cold-Strain in Piping 459
Collectivism, Address at Bar Association..... .....Courtenay De Kalb.... 576
Individualism or .....Editorial.... 415
Collie, J. E.... .....California Eight-Hour Law.... 295
Ditto ..Estimation of Cyanide in Mill Solutions.... 461
Colombia, Pasto Gold District..... 583
Colorado, Geological Distribution of the Precious Metals in (I, II, III).....T. A. Rickard....89, 150, 316
Matte Smelting at Denver.....H. Foster Bain.... 250
Metallurgical Progress in....Philip H. Argall....35, 362
Ditto .....Modern Smelting & Refining Co.... 228
Mineral Production in 1909.....T. J. Dalzell.... 474
Whitepine Iron-Ore Deposits.....E. C. Harder.... 387
Company Report..Alaska Mexican Gold Mining Co.... 851
Ditto .....Alaska United Gold Mining Co.... 782
Ditto .....Associated Oil Co.... 685
Ditto .....British Columbia Copper Co., Ltd.... 411
Ditto .....Broken Hill Proprietary, Ltd.... 699
Ditto .....Calumet & Arizona.... 664
Ditto .....Daly-Judge.... 511
Ditto ....Federal Mining & Smelting Co. v. Bunker Hill & Sullivan M. & C. Co..... 176
Ditto .....Lucky Tiger.... 664
Ditto .....Montgomery Shoshone Con. M. Co.... 511
Ditto .....Nipissing Mines Co.... 699
Ditto .....Rio Plata Mining Co.... 411
Ditto .....Round Mountain.... 664
Ditto .....Shannon Copper Co.... 206
Ditto .....Standard Consolidated Mining Co.... 699
Ditto..United States Smelting, Refining & Mining.... 848
Ditto .....United States Steel.... 511
Compressed Air, Cost of Power Transmission, Electricity Versus 700
Compressing Air by Water....George C. McFarlane.... 281
Compressed Air, Oil Heater for..... 929
Compromise, Smelter Fume.....Editorial.... 383
Comstock Lode, Re-opening the Mexican Mine..... .....Whitman Symmes.... 419
Comstock Merger .....Editorial.... 382
Concentrate, Cyanidation of.....A. E. Drucker.... 416
Concentration, Slime.....Frank R. Porter.... 430
Concentrator of the Bunker Hill & Sullivan, New..... ..... Gelasio Caetani.... 120
Concrete Bridges, Long-Span..... 891
Cones and Tube-Milling, Diaphragm.Walter Neal....483, 589
Congress of Geologists, Stockholm, 1910, Eleventh.... International 557
Stockholm, International Geological....Editorial.... 544
Connelly, W. A.....Piz-Piz District, Nicaragua.... 350
Conservation and Alaskan Coal....H. Foster Bain.... 185
And Inland Waterways.....Edward P. North.... 225
And Its Progress.....Editorial.... 3
And Some Difficulties.....E. L. Allison.... 262
Federal Authority and.....Conservationist.... 869
Consolidated Arizona Smelting Co.....498
Consolidated Gold Fields of South Africa.....232, 235
Consolidated Mines Co.....167, 236, 690

EDITORIAL.

Greeting.

The Annual Review Number is the medium we use once each year to express appreciation of our readers' indulgence for our sins of commission and omission. The year 1909 to us will be a memorable one, marking as it does the enlarging of our scope through our affiliation with Mr. T. A. Rickard's 'youngest born', *The Mining Magazine*. His interest in the MINING AND SCIENTIFIC PRESS is lessened in no degree by his change of residence to London. To our friends who have supported us by their interest we extend our hearty thanks. Not the editors alone, but the contributors and the advertisers as well, make a paper. All have done their part this year. Nineteen hundred and nine was a successful year from every point of view. Our subscription list is longer, the professional directory has grown until it is now the most complete printed in any mining journal, and today we present the largest paper ever issued in our half century's history. We recount these things less in a boastful than a thanksgiving spirit. We believe in a mining journal as the organ of the profession—a paper written by and for mining engineers, and the flattering increased support which this paper is receiving from the active men of the profession is as gratifying in its evidence of success in approaching

our ideal, as is the tangible reward on the business side. To us mining engineering is at least as noble as is any other profession, and we welcome all evidences of growth of a true professional spirit. We welcome also such evidence that ideals have place and bring profit in business.

MINING in the Lake Superior copper district has been reviewed for us this year by Mr. Robert H. Maurer, who has been a collaborator with Mr. Horace J. Stevens, well known as the author of the invaluable 'Copper Handbook'. The source of our review is a guarantee of its high value.

PRODUCTION at the Goldfield Consolidated continues on the magnificent level maintained throughout the year, which has made this the premier gold mine of the world. The official figures for November reveal a production of 19,284 tons of ore, valued at $724,450, of which 93.96% was recovered as bullion. The average value of the ore was $35.30 per ton, and the cost of operation was $6.92.

COPPER has attracted more attention in the year just closed, than did any other metal. We have peculiar satisfaction, therefore, in presenting in this issue a full review of the copper markets of the year written by Mr. L. Vogelstein of L. Vogelstein & Company in New York. The world-wide activities of this firm make the review authoritative and we are glad to express our hearty appreciation of so able a collaborator.

IT GIVES us pleasure to announce that Mr. M. E. Applebaum, president of the New York Metal Selling Company, will write for us hereafter a monthly review of the metal situation. This will appear in the first issue of each month. In view of the fact that Mr. Applebaum does not represent any specific copper-producing interest he will be able to give an unbiased view of the situation, and we take this opportunity of expressing our appreciation of his co-operation.

THE ANNUAL review of progress in cyanidation and related phases of milling by Mr. Alfred James has become an institution. We have great pleasure in presenting in this issue his letter for 1909. Mr. James always writes trenchantly. Not everybody agrees with him, in his rating of filters for example, but his criticisms are always founded on wide observation and study and are worthy of, as they will receive, wide attention. His letter always provokes discussion stimulating to the profession, and we shall be glad to hear from his fellow cyaniders. For our own part we defer till a later issue a more specific review of progress in American methods.

GOLD MINING in France is the title of an interesting article by Mr. James A. Rickard in the December number of *The Mining Magazine*. Many gold producing districts in southern Europe are becoming prominent with the cheapening of costs of treatment. The same issue of this magazine contains articles on the 'Early Days on the Gold Coast', by Mr. E. T. McCarthy, and 'Measurement of Pulp and Tailing', by Mr. W. J. Sharwood, with many other valuable metallurgical contributions. 'Professional speculator' continues his analysis, classifying the leading mining stocks of the world under the headings of Excellent, Fair, Moderate, Indifferent, and Remote. The editorial pages are notably attractive, covering questions which engage the present attention of all advanced engineers and mine operators.

THE EIGHT-HOUR LAW relating to labor in mines and reduction works has been sustained by the Supreme Court of California in the test case brought in the form of an application of Mr. Fred J. Martin for a writ of *habeas corpus*. The law was purposely violated in all its provisions, so that the decision handed down settles the relative obligations of employers and employees in these particulars. The constitutionality of the law is affirmed, the contention that it is special or class legislation being refuted. The inclusion of mill-men within the meaning of "men working in smelters and reduction works" is sustained, and the meaning of eight hours "actual work" is held to be time actually engaged in labor, exclusive of that taken in traveling to and from the place of work. The decision will be more fully discussed in a later issue. Our anticipations have been confirmed. The findings of the court seem inevitable under strict legal reasoning.

Far Eastern Mining.

Mining in the Orient in 1909 made good progress. Interest in gold mining centered largely in the placers. In East Siberia Mr. C. W. Purington demonstrated the value of the gravels near the mouth of the Amur, by a 90-day run with a Paige scraper-excavator. At a working cost of less than 10 cents per ton, 61,500 cubic yards were handled. The total clean-up amounted to $67,000. The greater part of the material was tailing from old placer workings. The Kolchan mines, at which this work was done, include 6000 acres, of which about one-half is suitable for dredging. The normal working season is 200 days. Wood, at $1.25 per cord, is available for fuel. As all conditions seem favorable, a large modern dredge is to be installed next year.

In Burma elaborate tests carried on for some time by Mr. N. Samwell having proved the value and availability of the ground, preparations are now being made to begin operations on a large scale. A modern dredge has been ordered, and it is expected that others will be erected later. In the Paracale district of the Philippines the most distinct success of the year has been scored by the dredges. The machines in use are of New Zealand type and are small as measured by California standards. However, the placers are shallow, soft-bottomed, and the material handled is mainly of small size. The country is low lying and swampy, and the extent of the payable ground is unknown. The gravel has proved to be rich, yielding approximately a dollar a yard, and there seems to be every probability of the development of a satisfactory dredging field. Considerable new capital is going into the district and its steadily increasing importance may be safely predicted. Quartz mining in the Philippines also shows signs of improvement. The Benguet Consolidated

has been put on a paying basis and the neighboring Headwaters mine is reported to have developed ore reserves sufficient to warrant the building of a 60-ton mill. At Masbate the year's work has been satisfactory and profitable mining seems near. In the Malay Straits the tin output in the first ten months of the year showed a gain of approximately 50,000 piculs of 133⅓ pounds each.

Attention at Manila is just now centered more on oil than gold. It has long been known that petroleum was present in the Islands and numbers of seepages have been marked. On the Tayabas peninsula some drilling has been undertaken. A recent reconnoissance of the field by Mr. George I. Adams, of the Philippine Bureau of Mines, resulted in a favorable report, and it now seems likely that American capital will be invested. The oil so far found is of unusually high grade, and resembles that from the Dutch East Indies. There would be considerable local market, and in addition it seems likely that oil could be brought to the United States to advantage, since California petroleum is usually deficient in the lighter volatiles. The fuel problem in the East seems in a fair way to be satisfactorily settled. The East Batan Coal Mining Co. has opened a colliery and built a wharf at Batan and is prepared to fill commercial orders. Preparations are being made to furnish an output of 1000 to 2000 tons per day. The Batan coal has been tested recently on a trans-Pacific voyage of one of the transports and was found satisfactory and economical. In the north both Chinese and Japanese companies are now supplying coal in quantity. One of the incidents of the year was the conclusion of negotiations regarding the Fushun mines in Manchuria, Japanese possession being confirmed.

The major interest in China has been in railway development. Probably the two most significant events of the year were the satisfactory ending of negotiations between China and Japan regarding the Antung-Mukden line, and the opening of the Peking-Kalgan railway. By the former, not only is a much needed railway link secured, but the joint development by the two Powers of the important mineral resources of a large area assured. The Peking-Kalgan railway is of note not only from its commercial aspects, but because it has been built exclusively by the Chinese with money derived from the profits of the Imperial Railways of North China. In marked contrast with many American lines, Chinese railways are immensely profitable, the proportion of expenses to earnings in one case being only 28 per cent. The new line is 122 miles long and joins Peking with an important city in the northwest. It is to be rapidly extended, and is a standing reminder of the fact that under honest and efficient management China is prepared, to an unappreciated extent, to develop her own resources. Much has been heard in the course of the year about American participation in the Hankow-Sze-Chuen railway loan, but negotiations still drag. The importance of the matter is to a large extent sentimental. The real development of Chinese mineral wealth has not yet begun, though apparently a secure foundation is being laid in monetary and administrative reform.

Conservation and Its Progress.

The beginning of a new year is an appropriate time to take account of the state of public opinion as well as to measure the output of our mines and to forecast the markets. Of the great public movements now in progress, none more intimately concerns the mining industry than that initiated by Mr. Roosevelt when in May, 1908, he called into conference the Governors of the States to consider the problem of conserving our natural resources. The time was ripe, and the method chosen was well calculated to fix attention. Following the first conference and a hard summer's work on the part of the 'National Conservation Commission', a second gathering was held at Washington, in December. At this meeting reports of the various sections and committees were submitted, and the first great national inventory was placed before the people. It is impossible here to give a resumé of the report which, with the accompanying discussion, forms nearly 800 printed pages. It is a public document (No. 676 Senate, 60th Cong., 2nd Session) and may be readily obtained. The main conclusions are familiar to all. In general the report showed that the natural resources had limits which should be taken into immediate account in business operations. The need of much more study before recommending a complete program was clearly shown, and arrangements were made for a joint committee to carry on the work. At the close of the year this second conference had but recently adjourned and hope of Congressional aid in at least part of the program, was strong.

In 1908 and 1909 a number of the States established Conservation Commissions. In a few they were duly created by statute and provided with independent funds. In others they were made informal committees to assist in the correlation of the work of the various departments. It early became apparent that in Congress there was little disposition to give definite recognition to the movement. Relations between Congress and Mr. Roosevelt were strained, and it was openly charged that the President had exceeded his authority in appointing a 'Commission' without first securing legislative approval. Not only was no provision made for the permanent support of the 'Conservation Commission', but its disbandment was forced by a clause slipped into the Sundry Civil Bill forbidding the detail of any employee for service with any such commission, or the payment of any money for expenses or salary to anyone working on such a commission or council. This effectually stopped the movement so far as any direct participation of Federal officers was concerned. On the other hand, Congress did slightly increase the funds available for the work of the regular Government bureaus, such as the Geological Survey, engaged in making studies of the sort recommended by the Conservation Commission. There is no question as to the legal authority of Congress to take the action that has been noted, but there is also no question in the minds of most of those familiar with conditions in Washington at that time that this action was taken less through motives of broad public policy than of a personal desire to 'get back at' the President. Of the whole legislative program asked by the Conservationists, the only re-

form achieved was an Act permitting an entryman, under certain specific conditions, to elect to aequire title to surface only in the case of agricultural lands underlaid by coal.

On Mareh 4 a new President was inaugurated, and no portion of his policy has been more elosely scrutinized by the public than that relating to eonservation. Mr. Taft's program in this matter, as announced in September at Spokane, has been reviewed already. In that and subsequent speeches he made it sufficiently clear that he is in favor of conservation, but disclaims any responsibility in the matter further than to make recommendations to Congress. A speeial message on the subject is promised soon after the holidays. The public will await it with a certain academie interest. Just what good it will do is far from clear, since Congress has already shown an unfriendly attitude. Mr. Taft is evidently a 'wise and upright judge'. We believe him to be sineere in his interest in the movement, but we also believe him to be obsessed with a fear of any rupture of friendly relations. He has deliberately chosen to adopt the plan of bargaining in legislation. Having given consent to the tariff bill, having sacrificed popularity to endorse publiely Mr. Aldrich and Mr. Tawney, he would seem to have a balance to his credit and to be entitled to draw a certain amount of legislation on account. His draft will presumably be honored, but we fear that the rate of exchange will be found high. The astute keepers of the legislative shop know well the art of marking up the price while a customer lingers at the window.

In one other particular the year has been notable—in the prominence given to the so-ealled Pinchot-Ballinger controversy. It is a little difficult to see how it eame to be regarded as so essentially a personal matter. That Mr. Gifford Pinchot, the Forester, and Mr. R. A. Ballinger, the Seeretary of the Interior, are not congenial members of the official family has been abundantly evident from the first. It is not neeessary, however, to impute to either any personal motive or any dishonesty. They are merely the unlueky present representatives of the ever-eontesting camps of loose and strict construetionists. Both have been severely criticised, Mr. Pinehot for excessive zeal in behalf of the general good, and Mr. Ballinger for similar zeal in behalf of individuals as against the Government. It is well to remember that Mr. J. R. Garfield, who became eventually the almost champion 'trust-buster' of the last administration, was once bitterly 'muck-raked' for a too friendly attitude toward the Chieago packers. We have no desire at this time to judge Mr. Ballinger, but we would point out that between doing the utmost that the law allows and the minimum that it requires, there is as broad a 'twilight zone' as between State and National authorities. Within that zone the President as chief executive has full responsibility both for himself and for the subordinates that he seleets.

In 1908 the Conservation movement was organized, and made rapid headway. In 1909 it practically stood still. In 1910, whether it shall dwindle or shall enter the constructive stage, will be determined largely by one man, Mr. William Howard Taft, President of the United States.

Bureau of Mines Again.

The bill providing for a national Bureau of Mines has been reported favorably at Washington, and will doubtless be passed promptly by the House after Congress re-eonvenes. In the Senate the Committee on Mines and Mining proposes before reporting to hold public sessions to hear evidence for and against the measure. In the meantime Mr. S. M. Cullom of Illinois has introdueed a resolution calling on the Secretary of the Interior for information regarding the mine rescue-work now being carried on by the Government, and the funds needed for its expansion. This resolution called out a spirited debate as to the function of the United States Government in such matters. It may be promptly conceded that to the States belongs the police power of regulation in mining, without absolving the Federal authorities of all responsibility. There is abundant room for both. A national bureau whieh is scientific and investigative in charaeter, corresponding in faet to the Geological Survey, is necessary, if the States are to proceed wisely and with any degree of uniformity to inspect and regulate the mines. The benefits of such a system have been shown already in the establishment of a system of 'permissible explosives' for use in gaseous mines. The Geological Survey, with the coöperation of the manufacturers, tested the explosives offered, and listed those found safe. The inspectors, thereupon, in the States where they had authority, promptly ruled that only such powders should be used. It was a simple cheap means of ending a condition of almost intolerable uneertainty and danger. Any system of State laboratories and State tests would have involved enormous expense and endless conflict, as exists already in the simpler matter of grading illuminating oils. In the matter of mine rescue-work it must be clear that the United States Government cannot undertake to equip and maintain enough stations to meet all demands. Its duty must continue to be largely that of pointing the way and setting the pace. The States and the District Associations of operators must supplement these efforts.

The growth of the sentiment favorable to a national Bureau of Mines has been steady, and the extent to which public opinion in the matter has elarified is seen by a comparison of the bills regarding the subjeet presented to Congress this year and last. In 1908 the proposed acts were as varied as they were numerous. Many of them were impracticable and some actually harmful. As indieative of present conditions may be cited the faet that the various bills now before Congress were taken up and considered in detail at a meeting held in San Franeiseo, December 20, at which were present some twenty of the foremost practising mining engineers of the Pacific Coast. After full consideration they unanimously endorsed the bill presented by the House Committee and urged its prompt passage by both Senate and House. It was recommended that a proviso be added to make clear that neither the Bureau itself nor any of its members should engage in private work—extending in fact to the new Bureau the excellent rule under which the Geological Survey has operated. A provision of this sort is in the Dick bill now before

the Senate Committee, and should by all means be included in the measure passed. We believe that a Bureau of Mines can be established, manned, and run on the same high plane that has given to the Geological Survey the universal confidenee of mining men. There is clear need for such a Bureau to study problems relating to safety in mines and efficiency of mining. Too much legislation based on imperfeet or inaccurate data already cumbers our statute books, and accurate data are urgently needed. That the National Government should assume its share, not the whole load, of the responsibility and expense of acquiring this material, is but simple justice to the great mining industry. In the Technologic Branch of the Geological Survey there is an adequate nucleus for the proposed organization, and the excellent work already done is an earnest of what a larger organization with adequate funds may be expeeted to accomplish. Such an organization, to do good and economical work, should develop rather than be suddenly created, and the time is clearly ripe for the next step in the growth of this particular work—the organization of the National Bureau of Mines as a means of promoting safety and efficieney in a great basal industry. Mr. Senator and Mr. Congressman, it is up to you. A small amount of action will save many more lives than a large amount of talk.

Gold Production and Value.

No startling changes have occurred in gold production during the year 1909. An increase is evident, which is variously estimated between two and three per cent. In 1908 the world's output was placed at 21,529,300 fine ounces, worth $444,382,312. The bankers of the country are anticipating an increase to nearly 22 million ounces for 1909. This is probably an underestimate. The Transvaal alone will make a showing of about $155,000,000, which is better by ten million dollars than in 1908. Rhodesia has apparently not done so well, the bullion shipments from that territory and from West Africa being estimated at approximately $15,500,000. The Australasian output has also receded to some extent, the forecast being for a total of not more than $70,200,000 for the year. There will be a slight fall in the Mexican production, somewhat difficult to estimate, but probably amounting to several million dollars. The Mexican contribution to the world's total in 1908 was $24,518,548. Indications are that a material increase in that Republic will occur in 1910.

The gold production of the United States has never reached a hundred million dollars in any year of its history. High-water mark was attained in 1908 when the output was $96,313,256. As there are no indications of important decreases in any quarter, and in view of the fact that Nevada shows an augmented production of nearly six millions, while the increased copper output of the country will add to the amount of by-product gold, it would seem safe to predict that the United States will be credited with more than $100,000,000 worth of the yellow metal for the year 1909. The growth in Nevada is peculiarly gratifying. The heavy shipments of ores, which brought the output above fifteen millions in 1907, proved wasteful, and this led to a sharp curtailment during the sueeeeding year, while preparation was being made for milling the ores at home. The result is seen in a rise from $12,090,218 in 1908 to nearly eighteen millions in 1909. California has steadily yielded about nineteen millions per annum for a number of years. A slight decline in lode-mining has been offset by the growth of the dredging industry. At the present time an increase in both forms of mining is noted, and the addition of a quarter of a million to the output during 1909 will probably be duplicated in 1910. Alaska will contribute at least as much as in 1908, and may pass the twenty-million mark. From Nome a total of approximately $4,000,000 is promised. Colorado will also hold its own, and with the activity which has been noted during the last six months it will retain its place at the head of the list among the gold-producing States of the Union, and its output will increase in future.

The annual production of gold has been rapidly increasing within the last twenty-nine years, a circumstance which has attracted the serious attention of political economists. In 1880 the world's total was $106,600,000. It had advanced to only $118,848,700 a decade later. Thenceforward the curve rose with extraordinary rapidity. In 1900 the output stood at $258,829,703. In 1905 it had reached $378,411,754; it passed four hundred millions in 1906; and apparently it will exceed $455,000,000 in 1909. Concurrently there has been an increase in the price of all commodities, which is the same as saying that the purchasing power of gold has declined. This phenomenon has been more noticeable within the past eighteen months, when an average increase of 35 per cent in all staple-commodity prices has been observed. The greatest advance has been in cotton and hides, closely followed by wool, while food-stuffs have risen on an average about thirty per cent since July 1908. If it were true, as some assert, that the increased production of gold was responsible for this decrease in its purchasing power, an advance in the price of metals corresponding to the greater cost of agricultural products should be noted. Such, however, is not the case. The higher cost of living has to some extent entailed a higher cost of production for the metals, so that iron and steel are about 25 per cent higher than in 1908, and copper has shown a moderate advance. Zinc has increased for special reasons, while other metals have shown sympathetic changes. But the metal market has not experienced an improvement in prices commensurate with the phenomenal soaring of quotations on agricultural products. This accentuates the point we have made in the past, that the opening of new mines and the growth of manufacturing, with the demand these make for an increasing army of men for the facilitation of commerce, has proceeded at so rapid a pace as to leave agricultural development proportionately far in the rear. Stated otherwise, there is an underproduction from the land as compared with the advance in other forms of industry. The purchasing power of gold for metals and metallic manufactures is relatively greater than for other staple commodities. If the change in price-level were due to an augmented gold supply there should be practical

uniformity in the rate of depreciation. Such uniformity does not exist. Economic conditions are manifestly responsible for the present discrepancies. A disproportion between the number of producers of staples for food and clothing, and the increased numbers engaged in metal mining, manufacturing, in commerce, and in the other arts and employments of a civilization which is growing more complex, has created an extraordinary demand for the necessaries of life, to which has come the inevitable response of higher prices.

M. L. de Launay, in his interesting book, 'The World's Gold', published a couple of years ago, pointed out that "the economic law, which seemed so firmly established, has been somewhat contradicted by the facts of the last ten years; the rate of interest, instead of continuing to fall, has risen perceptibly in the case of transferable securities." This has gone forward with great rapidity. Increased production of gold involves an augmentation of the bank reserve, and this should presumptively increase the volume of banking credit and work a lowering of the market price of money. Such has not been the case.

No cheap money is in sight either for call loans or for capital in its fixed forms. The phenomenon is not confined to America, in spite of an excess of gold exports over imports of $100,000,000 within the year. The bank rate in London has recently been up to 5 per cent, and has only slightly receded. Finally, it may be said that the volume of the world's business has enormously increased. Expansion of business has been witnessed on a vast scale; it has widened over continents, and progress has invaded countries, which were almost undeveloped thirty years ago. The bulk of this growth of industry has occurred within the past twenty years. It has broken the tendency to concentration of financial operations within narrow limits; it has multiplied the centres of demand for money, and has absorbed enormous quantities of gold in the active function of maintaining a balance of exchange. The demand for gold has expanded more rapidly than its production.

In spite of occasional discoveries of highly productive deposits it must be noted that the number of sources for rich ores is decreasing; that the extraordinarily high-grade placers are fewer than in the past; that the world is compelled more and more to devote its efforts to winning the royal metal from deposits of lower grade. The cost per ton for mining and treatment is lessening, but the cost per ounce of gold recovery is rising. This follows partly from the leanness of the ores, from the great increase in capital invested in mines and works, and from the rise in wages as a direct result of the enhancement in the cost of living. In view of all these circumstances it seems fallacious to ascribe the decreased purchasing power of gold to the absolute increase in the amount produced. The enormous development of the agricultural resources of the world which is taking place under the stimulus of excessive prices must presently overtake the development in other directions, and with the larger output the law of supply and demand must restore the exchange-value of gold to a point nearer its former level.

Mexico in 1909.

Conditions in Mexico are actually better than current complaints indicate. Affairs are in a healthy state when business is free from the peril of disarrangement by the imposition of new taxes. To that extent Mexico is in a better position than the United States, where the Payne-Aldrich tariff bill, pretending to lower the wall of protection, and really aimed at increasing revenue, materially upset business through most of the year. The fiscal year in Mexico ends on June 30. For the year 1908-09 the disbursements were roughly ₱18,000,000 in excess of receipts, but the optional expenditures provided for in the appropriations introduce an elasticity into the budget permitting of economies. Thus the estimates were ₱104,040,316, which the finance minister, Mr. José Yves Limantour, cut down to ₱97,871,750. The falling off in revenue, however, has produced no deficit, since there has been for some time an accumulating surplus, the excess of income for the previous three years having aggregated ₱29,358,893. In making up the budget for 1909-10, despite a manifest tendency toward improved financial conditions, Mr. Limantour has not attempted to discount the future, except in so far as to assume that such betterment will preclude recourse to the surplus, the forecast being for an outgo of ₱97,261,000. The railroad returns, taken as a barometer, justify this prediction of fair weather. The first annual report of the consolidated railroad property, which has just been issued, shows gross earnings amounting to ₱97,611,044 from the 5261 miles of road merged in the National Railways. This income was sufficient to meet all fixed charges in full, and also to provide for the guaranteed dividend of 2 per cent on the first preferred stock. This result was attained after allowing ₱1,340,400 as a reserve for accrued depreciation of equipment and after deducting ₱63,357 as 5 per cent of the net profits transferred to the reserve fund, leaving a surplus of ₱50,469 to be carried forward. The gross earnings fell off ₱6,500,000, the saving having been effected almost wholly through reduction in the cost of handling transportation. During the latter part of the year 1909 the gross earnings of the National Railways have increased more than two million pesos over those for the corresponding months of 1908. The decrease in freight carried during the period of financial depression has been chiefly in ores, noted more especially on the International Railway; a result of the low price of metals. A corresponding decrease in general merchandise was the natural corollary to this reduction of prosperity on the part of the leading industry of the Republic. The agricultural tonnage slightly increased, but this was abnormal, and is accounted for by an excess of importations of foodstuffs, necessitated by the failure in native crops. The abundant rains of the past season insure a return of agricultural prosperity, which will redound to the benefit of the mines as well as to the national exchequer.

It is worthy of note that the bulk of the revenue of the Mexican Government is derived from taxes levied on foreign commerce, the import duties alone returning ₱42,000,000. The stamp tax, against

which the mine operators are wont to protest, yields ₱13,500,000, the tax on mining property ₱1,800,000, and the Government royalty on gold and silver ₱2,250,000. Thus it appears that the direct contribution from the mining interests constitutes but a minor portion of the total national revenue. Indirectly, however, the foreigner bears a considerably larger proportion of the total, since the bulk of the native population absorbs a relatively small part of the imports, these representing in large degree the demand by aliens and by enterprises chiefly owned and operated by aliens.

The disparity between agricultural production and the development of the mineral industry, which is so conspicuous in the United States, is even greater in Mexico, and has materially increased the cost of mining. Under the most favorable conditions the output of grains and beans is inadequate, and an unfavorable season precipitates hardship. Such a crisis was experienced during 1909 when the shortage was so serious that the Government was obliged to import large quantities of staples for distribution at cost. But for this act of paternalism a severer burden would have been thrown upon the mining companies. As previously stated, the outlook favors a better harvest in the coming year. The development of the agricultural resources of the country is of paramount importance to the mineral industry, and to this end the Government is encouraging the building of many new lines of railroad. It happens that the mineral deposits of Mexico are so universally distributed that no railway extension can fail to open new districts. The Southern Pacific of Mexico is rapidly closing the gap which will connect the West Coast line with Guadalajara, thus benefiting the mining interests of Jalisco and Tepic, while opening the rich agricultural regions of the West to the central portion of the Republic. The extension of the Mexican Central from Guadalajara to Manzanillo has given the central plateau an outlet to a port on the Pacific, and has developed a district chiefly important for agriculture. A concession has been granted for a line from Oaxaca to the West Coast at Salina Cruz, and thence northward through Guerrero, Michoacan, Colima, and Tepic, connecting with the Southern Pacific. This has been acquired by the Pan-American railroad, under control of Mr. David E. Thompson, former Ambassador from the United States to Mexico. One division of the road, from Oaxaca southward to Ejutla, is already built, and will be continued into Central America. In the north conflicting rumors have been circulated concerning the completion of the projected extension of the Chihuahua Pacific across the mountains into Sonora. A favorable traffic agreement between the Cole-Ryan interests and the Southern Pacific will probably postpone the construction of this line except as needed for the development of lumbering in the Sierra Madre. It is said that for this purpose an additional 190 miles of track will be laid during 1910, which will benefit a number of mining camps in the mountains.

Without making invidious distinctions it may be pointed out that great activity has been a feature of three separate mining districts during 1909. These are Santa Eulalia in Chihuahua, Hostotipaquillo in Jalisco, and Pachuca. The prospects for increase of silver mining in Pachuca are particularly encouraging. A number of plants in the vicinity of Hostotipaquillo are only awaiting the completion of the transmission line from the Chapala Hydro-Electric Company's plant to begin operation on a large scale. This district is characterized by large bodies of relatively low-grade silver ores, with varying quantities of gold. Guanajuato has held its own by reason of capable management, despite the low price of silver, and it is interesting to observe that the predicted closing of silver mines in many parts of the Republic has not taken place. The producers of this metal have been clamoring for a return to the free coinage of silver, but the Government defends its monetary system by pointing to the damage resulting from fluctuation in exchange which seriously affects the cost of supplies. During the fiscal year 1908-09 the Mexican mints coined ₱6,528,000 of silver and ₱1,760,000 of gold.

The metal market has been unfavorable to the development of the smelting industry, although the Chihuahua smelter resumed in the early part of the year, and has been kept busy by the excellent developments at Santa Eulalia and elsewhere. The Velardeña smelter has been in operation, but the works at Torreón have experienced difficulties. This plant will, however, benefit by the general improvement which is now taking place, and a revival of smelting is also promised for Oaxaca. The smelter at Cananea has been a heavy producer, and the outlook for northern Sonora has distinctly brightened. Zinc mining has not been as seriously affected by the new United States tariff as was anticipated, and shipments continue to be important.

The oil industry has been in a feverish and disturbed condition for the larger portion of the year. This has been due in part to irregularity in the output of the wells, which is said to have led the National Railways to return to the use of coal for many of its engines which had been equipped for oil-burning. There has also been a bitter contest between the Pearson interests and other producers for control of the oil business, which culminated in a statute permitting the importation of crude oil free of duty for refining within the Republic. This act has been severely criticised as a concession to the Standard Oil. It certainly is not in accord with the jealous fostering of national industries so prominent in the policy of the Government in other directions. Large areas of unprospected oil territory exist, which it would seem wise to develop with such encouragement as could properly be granted.

The political excitement during 1909 has happily terminated by the withdrawal of General Bernardo Reyes from the arena. The stability of Mexico need not be questioned, and foreign capital continues to flow steadily into enterprises of every kind. The enormous sums invested in mines and railroads within the year is sufficient proof of the confidence of the world in the future of the country, to which may be added the significant fact that in spite of alarmist reports when politics were at fever heat, Mexican national and railway bonds showed no decline in price upon the exchanges of New York and London.

THE LONDON MARKET.

By T. A. Rickard.

The close of 1909 found Great Britain in the throes of a constitutional crisis and on the eve of a general election. Nevertheless, the phlegmatic temperament of the English people is admirably illustrated by the imperturbability of the general public, despite the shrill excursions and alarms of politicians and the grave warnings of statesmen. Business is not seriously affected, but proceeds in the customary detached manner. The mining market is quiet, but not depressed, such liquidation as marked the last quarter of the year being perfectly logical after the abortive boom that made Throgmorton Avenue so lively early in the summer. It is harder to 'stampede' the British public than in the delirious days of an earlier decade. Mining has become a saner business, promoters' profits are less extravagant, Companies Acts are more compelling, and shareholders are more wide-awake to their rights than in flamboyant days of yore. And it is well. The few make less loot, the many have a run for their money.

The year just ended has seen a decided revival of activity in the mining world of London and has given to 1910 the promise of further prosperity. South Africa still dominates the market and yields approximately 34% of the total gold production. Technical progress continues and the costs of extraction are undergoing a decrease highly creditable to those directing the industry.

Nevertheless a threatening cloud has overshadowed the promise of further development, and that is the scarcity of native labor. At the end of 1909 all the Chinese had practically been repatriated, so that the gold mines of the Transvaal are now dependent on Kaffir labor, bossed and supplemented by white men. Owing to the growing necessities of an expanding industry, not on the Rand alone, but in Rhodesia, as well as in the diamond mines, and by reason of an increased demand for labor in construction throughout South Africa, there has been a serious pinch in the labor required for new mining enterprises, and even a restriction in the current supply for established mines.

The 'big houses', meaning thereby the financial corporations controlling large groups of mines, prefer to belittle this danger to the progress of Rand industry, but the warnings of others equally well informed and less biased have checked speculation and have taken the life out of the share market. It is possible that the completion of the South African Union will enable more thorough and better organized recruiting for native labor throughout the southern half of the continent, and in this direction lies the best hope of improvement. Otherwise there will be a renewed demand for Asiatic labor and a revival of political controversy highly injurious to the business of mining.

West Africa has made great strides in 1909. The discoveries of ore and the developments underground have been satisfactory, but hardly less important are the amalgamations and consolidations of companies following upon the investment of capital by the leading South African and Western Australian operators. At one time a real boom in West African mines seemed imminent, but the restricted extent of the goldfields, and the dominance of one or two groups, tended to check expansion.

In Western Australia the continued, but slow, decline of gold mining marks the exhaustion of several productive properties. The total production has only decreased slightly, but the salient fact remains that no new big mines have been developed, although exploratory work in depth at Kalgoorlie has strengthened the position of the Great Boulder, Golden Horseshoe, and Ivanhoe mines. In this region also several useful consolidations have been effected, diminishing the cost of administration and releasing the mills of exhausted mines for the treatment of ore reserves in neighboring properties. But the most interesting feature has been the acquirement by the old Western Australian companies of new opportunities in other countries, by the purchase of oil lands, gold mines, and other ventures of a promising nature. This illustrates not only the dogged spirit of British enterprise but the recognition of the fact that a well organized staff is an asset not lightly to be discarded.

The Mexican and American mines on the British market have done well during 1909 and no noteworthy disappointments have injured the prospects for future business. The group at El Oro and the equally important group at Treadwell have continued to illustrate the profitable character of mining when conducted with skill and sense. New flotations are under way, and 1910 ought to see the addition of several names to the list of North American mines quoted on the London Stock Exchange. There are a number which might well be listed.

Russian mines have gained in prominence; one or two companies are doing excellently and others are full of promise. It is remarkable how many mining engineers have been sent to Siberia during 1909, and most of them have returned with encouraging reports. Unless all signs fail, that part of the world will be prominent in the mining record of the next decade.

The copper market has engaged the interest of many, and American mines producing that metal have afforded counters for some lively gambles, but the average Londoner is still quite skeptical as to the millions of tons of low-grade copper ore claimed to have been exposed with such astonishing rapidity in the new mines of the 'chalcocite disseminated in porphyry' type. The general skepticism has not prevented a few enterprising individuals from making handsome profits from participation in the boom on the New York curb.

There is plenty of money available for mining in London; the former issues have been thoroughly digested, and a new crop of speculators has reached the adult age, the mining business is in good odor, and it only needs a few striking developments to create a widespread financial interest. The various exploration and promotion corporations are keenly on the lookout for fresh opportunities, and any important new mining district would receive a profuse irrigation of British capital.

COPPER IN 1909.

Written for the MINING AND SCIENTIFIC PRESS
By L. VOGELSTEIN.

*Copper mining is one of the most important industries of this country. The amount of money involved in its exploitation is exceeded by that in few other lines of production, and the value of the product is probably exceeded only by the value of the iron and oil produced in this country. The most important event in the copper industry in 1909 was the formation of the statistical bureau called the Copper Producers' Association, which is supplying the world with correct statistics, showing the quantities of refined copper produced, the quantities shipped to domestic consumers and for export, and the quantities of marketable copper held in refineries or in warehouses at the end of every month. The benefits which the industry will derive from the organization of this Association are not yet fully appreciated, and it will take a few years' experience to demonstrate to the world that these statistics in the end will be the best barometer of copper-trade conditions. In view of the publication of statistics by the Copper Producers' Association we are this year, for the first time, in a position to give correct figures of stocks of copper, production, and deliveries, and we have to compare these figures with the publications of previous years by the United States Geological Survey, which are not quite as reliable, and are not compiled on exactly the same basis.

COPPER PRODUCERS' ASSOCIATION FIGURES, 1909.
(December estimated.)

	Pounds.
Stock January 1, 1909	122,537,266
Production	1,410,000,000
Domestic deliveries	700,000,000
Exports	690,000,000
Stock at end of year, estimated	142,000,000

U. S. GEOLOGICAL SURVEY FIGURES, 1908.

	Pounds.
Stock January 1, 1908	125,745,796
Refining output (blister copper exported added)	1,137,962,408
Exports	661,876,127
Domestic consumption	479,955,318
Stock at end of year	121,876,759

It will be seen from these figures that the apparent increase in the production of refined copper for the year 1909 was approximately 272,000,000 lb., or 25%. However, an analysis of this larger production will show that only part of the increase is due to an increased mining production in this country. In the first place, the American production in the year 1908 was seriously curtailed on account of the shut-downs incidental to the panic conditions of the year 1907. Furthermore, of the increased production of the year 1909, a larger part is due to an importation of large quantities of copper from foreign countries for refining in this country. The importations of copper for the year 1909 are going to reach 280,000,000 lb. as against 218,000,000 in 1908, and 252,000,000 in 1907. Consequently, of the increase of 272,000,000 lb., 62,000,000 are attributable to the increased importations of foreign copper. The balance is accounted for by the increased production from Nevada and Utah. According to the United States Geological Survey, the production of copper in Nevada for 1908 was 12,241,372 lb., while at the present time the Steptoe smelter of the Nevada Consolidated is producing copper at the rate of 6,000,000 lb. per month. The production in the State of Utah for the year 1908 was 71,000,000 lb., while for 1909, the Utah Copper Co. alone is turning out approximately this quantity. Besides, the mines belonging to the Amalgamated group, in Montana, will turn out their full complement in 1909 as against a materially reduced production in 1908. The increase in the State of Montana will probably amount to over 70,000,000 pounds.

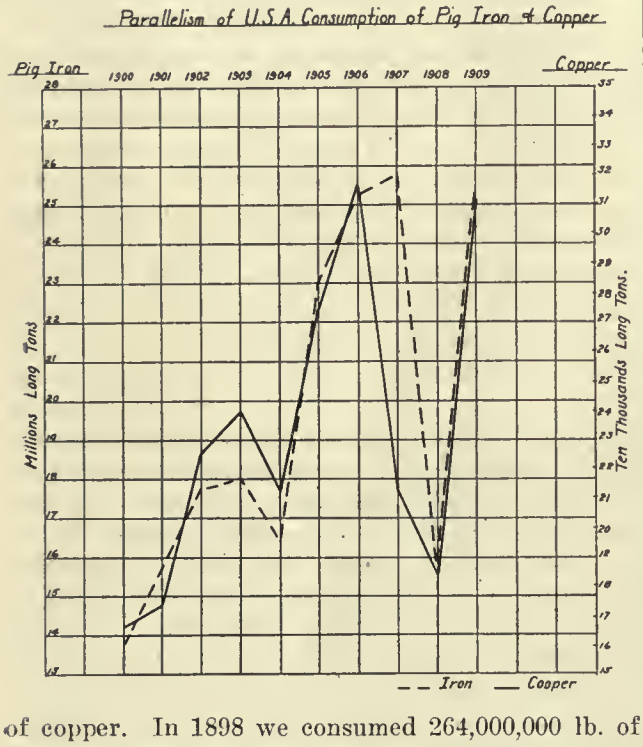
It will be noted from the above statement of consumption that during the year 1909 the copper consumption in the United States reached 700,000,000 lb. This is the largest on record, the highest previous record being the year 1906 with a consumption estimated by the United States Geological Survey of 686,000,000 lb. During the year fears were expressed time and again that production had outrun consumption to such an extent that an equilibrium could not be established. As a matter of fact, it must be admitted that the increase of visible supplies of copper all over the world shows that the world's production during the year 1909 far exceeded the world's absorption of copper into consumption. According to above estimates, the stocks of copper held at refineries in this country have increased between January 1 and December 31, 1909, by about 20,000,000 lb. The European visible stocks of copper as reported by the bi-monthly statistics, including controlled warehouses in Liverpool, Swansea, Birmingham, and France, show an increase to December 1, 1909, of 50,000 tons of 2240 lb. each, or 112,000,000 lb., and it is reasonable to suppose that the month of December will show a further increase in English and French stocks of copper of about 13,000,000 lb. making the total increase on the other side 125,000,000 lb., plus 20,000,000 increase in this country, or 145,000,000 lb. of copper for the whole year.

The world's production of copper for the current year is going to reach a figure of about 1,900,000,000 lb. (it is too early to make a close estimate of the world's production). Consequently, the increase in visible stocks of copper during the year 1909 represents hardly one-twelfth, or one month, of the world's production. In this connection it is worth while to compare the development of the iron and copper industries in this country. The accompanying diagram will show that these two industries are running absolutely parallel to each other, and that the increase in consumption of both metals has been continuous and in the same proportion, although there are some slight variations due to temporary conditions.

The paramount question in the copper industry of this country, and as a matter of fact in the copper industry of the world, is, what may we expect from the year 1910 as to production and consumption?

*Written December 14, all figures for December estimated.

The production of copper has reached in the year 1909 a high-water mark, and it is not likely to show a material increase in the year 1910. Experience has taught us that the world's copper production has to increase from year to year in order to cope with the permanent increasing demand for the red metal. The world's production of copper, measured in tons of 2240 lb. each, was as follows, the figure for 1909 being estimated: 1891, 285,000; 1895, 340,000; 1900, 495,000; 1905, 693,000; 1908, 760,000; 1909, 900,000. It will be seen that the production of copper in 18 years more than trebled. However, the consumption of copper has kept pace with this enormous increase, and with few interruptions during periods of commercial depression, consumption has overtaken production in spite of the enormous increase in supplies. Particularly this country has been making exceptional strides in the consumption



of copper. In 1898 we consumed 264,000,000 lb. of copper; in 1901 we consumed 390,000,000 lb., an increase of 50% in four years. In 1903 we consumed 500,000,000 lb., an increase of 25% in two years; in 1906 we consumed 700,000,000 lb., an increase of 40% in four years, or comparing consumption in 1898 of 264,000,000 lb. with 1906 of 700,000,000 lb., consumption increased in eight years 165%. A careful study of these figures will show that had it not been for the panic of 1907 our consumption of copper would have gradually increased during the year 1909 to at least 800,000,000, and should reach in 1910 900,000,000 to 950,000,000 lb. While this theory was very much questioned and doubted at the beginning of the year, the last few months seem to indicate the correctness of such calculation.

Deliveries of copper into domestic consumption have steadily increased since the beginning of this year and have reached by the month of November a figure of 66,000,000 lb., which would indicate an annual consumption of 800,000,000 if continued for twelve months. In spite of this huge consumption of copper by the end of the year, it is admitted that construction of new large power-plants, electrification of railroads, building of trolley lines, and other work, has not been resumed since the interruption in the year 1907. The reports issued by the big electrical manufacturing companies show clearly that consumption is still running far behind the years 1906 and 1907. It is, therefore, reasonable to assume that with a revival of construction work, which is bound to come, consumption of copper in the United States will soon reach 75,000,000 to 80,000,000 lb. per month.

The price movement during the year 1909 was very erratic. At the beginning of the year the price for electrolytic copper was 14c. to 14.25c., this price having been reached in the latter part of the year 1908, stimulated by the election results and in anticipation of an early improvement in business. Owing to the disappointment felt over the slowness of the improvement, and owing to large new supplies coming on the market, this price could not be maintained, and it declined rapidly during the months of January and February, reaching a low point in the beginning of March when European buyers bought enormous quantities of copper at 12c. per pound. These enormous purchases stimulated the market, and it gradually improved from the low point at which not all of the producers were sellers, reaching about 13½c. by the middle of June, when the improvement in the iron and steel lines commenced to be felt in copper. The heavy production shown in the statistical publications, and the fact that European consumers had covered their wants at the low prices prevailing in the early spring for several months, brought about a cessation of the buying movement, and prices sagged off slowly to about 13c. by the beginning of August. The publication of the Copper Producers' Association figures for the month of July stimulated the market for a short while, but pessimistic sentiment in England and on the Continent, the tightening of the money rates, and the bearish attitude of some of the principal sellers, further depressed the price to about 12⅞c. by the end of October. At that time rumors of the negotiations for the combination of the principal copper mines in this country were spread, and stimulated by these rumors and by some speculative purchases of copper the market took a sudden spurt and slowly advanced to about 13½c. during the second half of November. The decision of the Circuit Court against the Standard Oil Co. put a temporary damper on the combination rumors and thereby depressed the copper market; so that at this writing prices are slightly below the best. It is, however, felt that the improvement in the market conditions due to the increased consumption in this country is going to be sufficient to keep copper prices from falling materially below the present level.

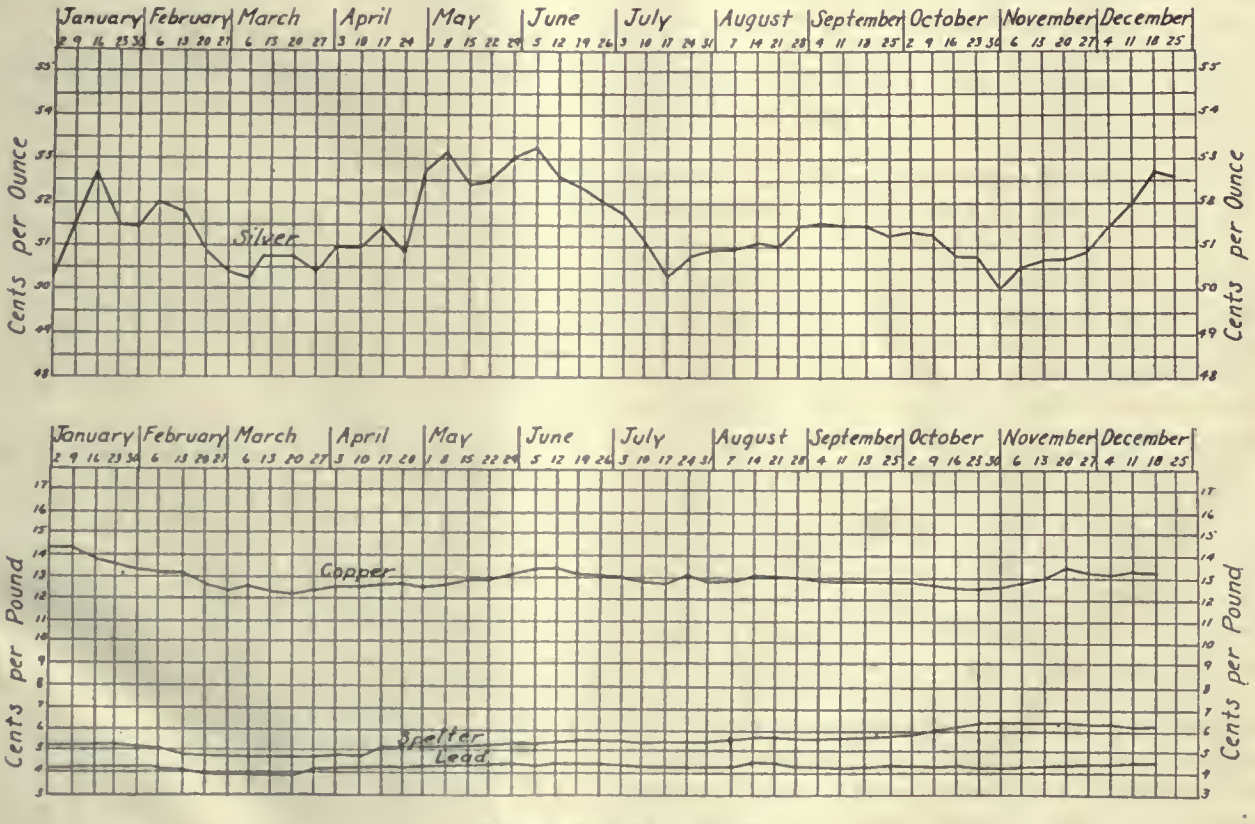
In conclusion a word should be said about the importance of speculation in the maintenance of copper prices. Ever since the panic of 1907 outside speculation has taken hold of the copper market and time and again has surprised the producers and consumers by taking a bold stand whenever large offerings seemed to find a bottomless market. These speculators have not made any material profit during

the past two years, but they have held on to their purchases, firmly convinced that sooner or later the improvement which has been felt in all other markets, and particularly in the iron market, would have its effect on the copper market. Only an open and free market, such as exists on the London Metal Exchange, could have afforded the facilities for speculating in copper to outsiders, and looking backward at the troublesome period of the last two years, it can be stated emphatically that, without the assistance of outside speculation, prices would have reached a much lower level on account of the inability or unwillingness of producers to carry larger stocks of copper. Practically all the copper carried in English and French warehouses is being held for account of outside speculators, who are paying heavy interest, carrying charges, and commission.

LEAD IN 1909.

Written for the MINING AND SCIENTIFIC PRESS
By J. H. LANG.

The lead market closed in 1908 under the depressing influence of anticipated tariff revision and the rather poor business current at that time. These influences continued operative during the first two or three months of 1909 until prices in March had fallen to 4c., New York, for common Western de-silverized metal. The Dingley tariff provided a duty of 1½c. on lead in ore and 2⅛c. on pig lead. A strong fight was made to have these rates reduced to 1c. and 1½c. respectively, and for a time it looked as though the effort would be successful. In fact advance copies of the new tariff published in March gave the lower



Range of Metal Prices in 1909.

The development of the market during the year 1910 will depend principally on conditions in this country. Business in Europe has been good, although not splendid, but conditions in the Old World are much steadier, and the figures of consumption in foreign countries do not show the heavy fluctuations which are to be seen in this country. If the hypothesis of a continuously increasing consumption in this country as elaborated above be correct, as it seems to be, according to past experience, it will only depend on the producers whether a higher level of prices can be established and maintained during the coming year. If producers will strain every effort to smelt and refine as much copper as they can possibly turn out, it is doubtful whether a permanently higher level of prices can be maintained in view of the present large accumulation. If, however, producers will at least refrain from increasing their present production, a higher level of prices should be within sight.

duties but almost over night a change occurred and the full text of the bill when officially published restored the old rates. In consequence, and stimulated by the better demand which has accompanied the business revival, prices have steadily risen, reaching by the middle of December 4½c., New York, with good prospects of a further advance. The demand from corroders which remained fairly constant even during the panic, has made new high records this year, owing to the building boom. The 'Pure Food and Drugs Act' militates against the use of substitutes and adulterants through mis-branding. The able and intelligent advertising campaign conducted by manufacturers showing the value of lead as a pigment has also had its effect. Depression of the electrical industry, which normally uses large quantities of lead, was chiefly responsible for the reduced consumption in 1908. This industry having recovered from the panic but slowly, has probably not re-

quired in 1909 as much lead as in 1906-07, but the outlook is that during the next 12 months electrical manufacturers will be large buyers of this commodity. In fact, there is every reason to expect a larger use of the metal in all lines than ever before.

Any estimate of production at this time would be largely guess work, but it is reasonable to look for some increase, especially in Missouri, and it is quite safe to predict that the losses of 1908 will be fully made up. In addition to the domestic production, we used in 1909 the usual quantity of lead from duty-paid ore and bullion. Exports of foreign lead from bonded refineries, however, were much heavier and promise to make a new high record in 1909, having nearly doubled in two years. The effect of these large exports, in conjunction with liberal supplies available to foreign markets from other sources, has operated to keep the price abroad at a low figure, though there was a tendency to rise toward the close of the year, due partly, no doubt, to better business, and possibly to some extent to the operations of a syndicate formed to rescue the industry from its unprofitable condition.

Prices of 'Soft Spanish' in London have varied from £12 7s. 6d. to £13 13s. 9d., equivalent, respectively, to about 2.70c. and 2.73c. per lb., United States currency, and is today at about 2⅞c. per lb. With New York prices where they now are, duty considered, whether lead made from duty-paid ore can be more profitably kept in this country or shipped abroad is quite evenly balanced. The two markets are about on a parity, and may react on one another. In considering this possibility, however, it should not be forgotten that 'Soft Spanish' lead sold as high as £21 15s. in 1907, and averaged for the last three years £16 17s. 6d. (3.65c.). Given a fair revival of trade, prices of metal abroad will rise. Granted a restoration of the three years' average, we should have prices equivalent to 5¼c. duty paid, New York. It is interesting to note in this connection that the new tariff does not provide for the liquidation of bonded lead on exportation of 90% as heretofore, but requires that the whole quantity be exported. The domestic market may thus be deprived of the large quantities of foreign lead annually derived from this source during the past several years.

All things considered the trade has every reason to look forward to the future with optimism. It is the history of America that while trade occasionally stands still or experiences temporary reactions, progress is sure to be resumed with increased vigor. It is not quite clear from what source the increased quantities which, if history repeats itself will be required in 1910, are to be obtained except at higher prices.

The iron ore deposits of Minas Geráes, Brazil, have recently been examined by the Geological Survey of that Republic. The known deposits number 52. Development has been carried on to such an extent as to admit of estimates of quantity which are placed at approximately 6,000,000,000 tons of ore containing more than 60% of iron of merchantable grade of purity.

SPELTER IN 1909.

Written for the MINING AND SCIENTIFIC PRESS
By J. H. LANG.

The spelter market during 1909 has been one of unusual interest. The metal was hard hit by the panic. Its principal uses being for galvanizing and brass making, it suffered in common with iron, steel, and copper. It maintained, however, a relatively sound position—production being cut down in line with the reduced demand so that while stocks accumulated they did not become unwieldy and, as pointed out later, they have since disappeared. Because of the financial stringency and the fact that the industry both as to mining and smelting is less consolidated than is the case with any other metal, the price declined from 7c., St. Louis, early in 1907, to 4c. in December of that year. This latter price was altogether too low, and 1908 marked a sharp recovery, the average for that year being about 4¾c., St. Louis.

January 1909 opened with the market at 5c., but the threatened reaction in business shortly after the first of the year carried the price down to 4⅝c. From that time on, however, there was a steady appreciation, tariff agitation having exactly the contrary effect from that experienced by lead, for, whereas lead miners had high protection and were threatened with a reduction, zinc ores were on the free list, and their producers were clamoring for a duty. It early became apparent that they would succeed in their efforts, and the market rose rapidly, reaching 5¼c., St. Louis, by the middle of the year. It was evident, however, that this rise had by no means discounted the situation, and under the influence of heavy buying by consumers and large speculative purchases after the duty was imposed, the price advanced to 6¼c., at which point it has since held with but trifling reactions.

The large stock accumulated in 1908, estimated at one time as high as 40,000 tons, had dwindled to one-half that amount by the beginning of 1909. It is safe to assume that the whole quantity has since been absorbed, and the industry will enter 1910 in better shape than it has been for two years. Production is estimated at 210,000 tons, and consumption at 225,000, the difference representing decreased stocks.

These figures indicate, so far as consumption is concerned, that normal conditions have been restored, but production is not keeping pace with the improvement. Several causes militate against an increased output. The Joplin district, which is the principal source of domestic ore supply, has for a number of years apparently been unable to expand its production proportionately to the increased demand for spelter. From 1898 to 1908 the ore production in the Joplin district increased from 225,123 to 297,126 tons, an increase of only about 27%, while the production of spelter increased from 114,104 to 249,612 tons, or nearly 119%. In 1900 the production of ore in the Joplin district was 242,500 and of spelter in the United States 123,886 tons, or a ratio of 195 to 100. This ratio had been maintained on an average

for a long period preceding, but in 1902, the situation changed and the ratio of Joplin ore to total spelter production was only 167 to 100. During the last two years it has been only about 120 to 100, in spite of high prices during the larger part of this period. These facts were laid before Congress when the tariff was under discussion, and spelter being worth at that time only about 5c., at which price the duty would have precluded bringing in foreign ores, serious consequences were predicted. The subsequent rise, however, has enabled importations to be continued, and considerable prospecting and development has been undertaken in this country with fair success, notably in Wisconsin. The law as finally passed provided a duty of: ¼c. per lb. on zinc content of ores over 10 and under 20%; ½c. per lb. on zinc content of ores over 20 and under 25%; 1c. per lb. on zinc content of ores containing 25% or over. As transportation and other costs preclude bringing in ores under 25%, the maximum rate applies, and under present conditions, the ore being required, it forms a substantial prop under the spelter market. In other words, granted a consumption of spelter at the present rate, unless domestic ore production is enlarged, the price of the metal in this country can hardly fall below a level permitting the importation of foreign ores, principally from Mexico and British Columbia. At the same time that the above duties were imposed the rate on metallic zinc was reduced from 1½c. to 1⅜c. per lb. These circumstances bring the American into much closer touch than formerly with the foreign market. At the close of the year European brands could be laid down, c. i. f., New York, at 5.30c., or plus duty, 6.67½c. Domestic spelter, laid down in New York, would cost at this writing* from 6¼c. to 6⅜c., New York, showing that the margin below import cost is quite narrow.

An important development has been the formation of a syndicate abroad, or convention as it is called, whereby close control is maintained over the foreign market. Any large drafts from America would quite surely produce a sharp advance in prices, and we do not look to see the domestic market held in check by fear of imports. Also the foreign market is very strong, and prospects for higher prices in England and on the Continent are said to be excellent. In London spelter opened the year at £21 2s. 6d., and with occasional reactions worked its way up to £23 2s. 6d., equivalent in United States currency to about 5.05c. On the whole, therefore, assuming that the present favorable outlook for 1910 is measurably realized, it is reasonable to expect a demand for spelter fully commensurate with the supply, and the consequent maintenance of prosperous conditions throughout the industry. One factor having a possible important effect on production and prices in 1910 is the increased difficulty experienced by Kansas smelters in providing themselves with gas. Operations to some extent have already been interfered with from this cause, and predictions are not lacking that the smelting capacity will be seriously curtailed at no distant date owing to a shortage of gas, and a possible reversion to smelting with coal or oil.

*December 18, 1909.

METAL PRODUCTION IN 1909.

It is impracticable to give at this time exact estimates of the metal production of the year. In the articles on various pages of this issue, approximations are stated wherever data are available. The figures for gold and copper have been brought together in the form of tables. The world's gold production shows an increase as detailed elsewhere. Figures for Africa, India, and Australasia for the first nine months of the year are available and the estimates given are based upon them, it being assumed that the ratios of increase and decrease shown by Transvaal and Rhodesia respectively in the first three quarters held for the remainder of the year. The Australasian output will show a decline, as will also that of Mexico, though the exact amount cannot now be closely determined.

WORLD'S GOLD PRODUCTION.

	1908.*	1909.†
Transvaal	$145,819,016	$155,000,000
United States	96,313,256	105,000,000
Australasia	72,509,200	70,200,000
Russia	30,944,561	31,000,000
Mexico	24,518,548	22,000,000
Rhodesia	12,276,394	15,500,000
West Africa	5,773,544	
India	10,424,067	10,500,000
Canada	9,559,274	9,800,000
Other countries	36,244,452	37,000,000
Totals	$444,382,312	$456,000,000

*According to *The Mineral Industry.*
†Estimated.

In the United States there was a considerable increase due in part to the development of bonanza ore in Nevada, but mainly to the general increase in copper production. No figures for silver are available, though an increase undoubtedly occurred in the United States as another incident to the larger copper production.

Copper Production in 1909.

According to figures compiled by the *Boston News Bureau*, the production of copper in America for 1909, compared with 1908, was as follows:

	1909.	1908.
Arizona	325,622,000	262,200,000
Montana	312,000,000	293,800,000
Michigan	237,000,000	224,500,000
Utah	117,000,000	87,750,000
California	65,000,000	27,750,000
Nevada	53,700,000	7,500,000
Other States	45,000,000	37,000,000
Mexico-Canada	162,000,000	125,000,000
Total	1,317,322,000	1,065,500,000

Production of copper on the American continent is now at the rate of about 1,400,000,000 lb. per year. Notable in the above figures is the increase in production in Utah and California and the appearance of Nevada above the 50,000,000 lb. mark. An increase in production of copper for the year is noted from the Arizona mines. The following table gives a comparison of the estimated output in pounds.

	1909.	1908.
Copper Queen	109,248,000	89,200,000
C. & A. and S. & P.	52,704,000	50,300,000
Arizona Copper	32,072,000	33,600,000
Shannon	17,725,000	18,000,000
Detroit	24,375,000	19,400,000
Old Dominion	34,950,000	38,000,000
United Verde	36,710,000	33,000,000
Imperial	11,200,000	.....
Miscellaneous	6,638,000	12,300,000
Total	325,622,000	293,800,000

Dividends.

The Osceola Consolidated Mining Co. has declared a semi-annual dividend of $6 per share to be distributed January 26. Of the total, $196,686 will go to the Calumet & Hecla company, which holds 32,781 shares.

The Tonopah Mining Co. of Nevada has declared a dividend of 35c. per share payable January 21. After this has been paid the company will have a cash balance of about $1,000,000, and it is probable that the next dividend will be at the rate of 45 or 50 per cent.

The Guggenheim Merger as now proposed is to increase the capital stock of the Utah Copper Co. from 750,000 shares to 2,500,000 shares and absorb the Nevada Consolidated and Boston Consolidated, issuing one share in the new company for 2¼ of Nevada Consolidated and 2½ of Boston Consolidated, respectively. It is proposed to issue 2,100,000 shares at once using the revenue derived from the sale of the additional stock to enlarge the Utah Copper Co.'s plants and increase the capacity of the Boston company's Garfield smelter, the additional 400,000 shares being issued later to acquire the control of the American Smelting & Refining Co.'s Garfield plant and Baltimore refinery. The total estimated output for this merger for 1910 is 200,000,000 lb. of copper with a profit of $8,175,000 for the year with the metal at 13c. per lb. The estimated production for 1910 without the proposed improvement is, Nevada Con. 75,000,000 lb., Utah Copper 65,000,000 lb., and Boston Con. 25,000,000 pounds.

QUICKSILVER IN CALIFORNIA.

Written for the MINING AND SCIENTIFIC PRESS
By An Occasional Correspondent.

It can hardly be asserted that the present condition of the quicksilver mining industry in California is at all encouraging to the producers, notwithstanding the fact that within the past few months the prices for the metal have materially advanced in London, and, as a consequence, in New York and San Francisco. The difficulty being met is that the average percentage of mercury in the ores being taken from the principal mines of the State seems to be gradually showing a reduction. This average for the past year has not been over three-quarters of one per cent (0.75%), in the case of the larger pro-

Map of California.

ducers. A few minor properties have handled in retorts small lots of ore assaying as high as 2, 3, or 5% of mercury, or the mines could not have been worked to a profit, but the more important properties, reducing the ore as it is mined, without sorting, are not able to find it in quantity where it will yield an average of 1%. Some of them are working ore of considerably lower grade. This is vastly different from the early days of quicksilver mining in California when the New Almaden mine was producing nearly 2000 flasks per month from ore which averaged 36.74%. In the year of the highest production of this mine, 1865, when the yield was 47,194 flasks, the average percentage of the ore was 11.30.

From the experience of most of the mines of the State it would seem that the grade of the ore is materially less as depth is attained, and that the richer deposits are found near the surface. This may be noted from the record of the New Almaden mine, in Santa Clara county, which was long the principal producer of the State. That record is given later on in this article. The experience does not, unfortunately, accord with that of the Almaden mine of Spain which was worked 415 years before the Christian era, and is still producing, from deposits that grew richer in depth. The deposits at Idria, in Austria, have been worked since 1490, but no such life appears to be possible for the mines of California where the principal deposits of mercury in the United States are situated. It may be confessed that the quicksilver industry of California is in a somewhat decadent stage, no new deposits of importance having been opened in the past ten years, and the older mines not being nearly so productive as formerly. Some of the older mines, at one time famous for their yield, are at this time making their final clean-ups before discontinuing operations entirely. It is a matter of some surprise, however, that with the advanced price for the product some of the many known mines, long idle, have not been re-opened, as they were closed only owing to the low prices and lack of demand.

The contemplated closing of some of the older mines is the more to be regretted, since there is an increased demand for mercury, with larger sales, while there is a diminished annual output and a smaller stock on hand in San Francisco than has been the case for a number of years. There was, for a long period, a surplus stock on hand, which could not be disposed of except by shipment to Japan and China, where it had to meet the competition of the Spanish and Austrian mines of the Rothschilds, and had to be sold at lower prices than it would have brought in the United States had there been a sufficient domestic market. There was no other way to get rid of the excess of domestic production and the miners of quicksilver suffered accordingly, since it would not do to throw the entire stocks on the market at any price offered. Numerous small properties were compelled to cease operations.

The present California production is being used for home consumption and there is nothing to offer for export in large quantities. The California mines have no longer a surplus to sell to China and Japan. European countries have, of late, been buying heavily, and the same is true of the Eastern States. The former large stocks on hand have been altogether taken up by these demands.

As to prices for quicksilver, it may be said that about October, 1908, the London quotation was £8 10s. per flask; from this level it continued to decline until the figure in June 1909 was £8 5s. In September, 1909, the market suddenly took an upward turn to £8 12s. 6d., and in October it was £8 17s. 6d. In November the value quoted was £9 5s., and in December it was £9 15s. Meanwhile the local stocks had been absorbed by European and Eastern purchasers who have profited by the advance which they seem to have anticipated.

While a year ago the California producers were only getting $42 and $43 per flask of 75 lb., from now on they will derive the benefit from the higher range of prices; the only trouble is that they are not able to produce as much as formerly. There were only about 17,000 flasks of mercury produced

in California in 1908, though so-called official figures give a larger quantity. For the year 1909 those in the best position to know credit the State with but 16,500 flasks. In 1907 the State production was 17,431 flasks. It will be noted that the output of the State is declining, as heretofore stated. No new mines have been opened, and the old ones show a decrease in yield.

The principal producing mine in the State has been for some years the New Idria, in San Benito county, and this continues to make an output of some 700 flasks monthly. The mine is being worked up to its limit and is the only one in the State which is paying dividends of any moment. None of the former large producing mines in Napa, Sonoma, Lake, or Solano counties are making any especially favorable showing in the matter of increase in yield. It is an open secret that the once famous Napa Consolidated will shortly cease operation, and possibly the Great Western may not continue for a long period. Only the Oceanic, of the San Luis Obispo county mines, is doing much. In Santa Clara county the New Almaden is under new management and is yielding about 2000 flasks per year. This is from surface ores of low grade. The new managers, in 1910, are expected to conduct further development in the old mine in order to try to find new bodies of profitable ore. The Guadalupe mine, in Santa Clara county, is taking out better ore and more of it than for some time, this coming from new development, but not from the old mine proper. There are several unimportant mines producing a few hundred flasks per annum which are worked intermittently. The only new one of promise is the Chicago mine, near the Helen, in Lake county, which made small shipments in 1909.

There is little prospecting for cinnabar ores being carried on in California, and there has been small encouragement to open new claims if found. Possibly the recent advance in price may change this condition, but thus far there are no signs of it. After a declining demand for the past ten years or more the California producers were apparently caught napping when the recent increase in price and consumption came to be known. The local stocks were quietly absorbed at low prices though not long before the advance in value became apparent. Alaska, notwithstanding all its placer mines, has been a disappointment as a consumer of quicksilver, and indeed a few hundred flasks have been brought back from there lately. The demand from Mexico has materially decreased with the expansion of the cyanide process for treating silver ores. In the United States the consumption for metallurgical purposes has been steadily declining for some years, the cessation of silver mining and the adoption of the cyanide process in gold mining, together with the restriction of hydraulic mining, having gradually and materially reduced the demand in this direction.

The increase of extensive and deep copper mining on this Coast and elsewhere, has, however, caused an increase in the use of fulminates for exploding powder, and in such use of mercury, it is absolutely destroyed, and not recovered for re-use as in the amalgamation of gold. The same is the case in the use of mercury for drugs and pigments. The recent augmented demand appears to be due to increased use for fulminates, drugs, and pigments.

In the United States there are few districts outside of the Pacific slope in which the ores of mercury are found in such abundance as to be of great commercial importance. Becker, in his famous Geological Survey monograph on the 'Quicksilver Deposits of the Pacific Slope' shows that nearly every mineral association and mode of occurrence known to exist elsewhere, is repeated in California and Nevada, so that the mercury deposits of the Pacific Coast represent those of the world as far as they are known. This opinion was expressed over 20 years ago when, although the annual output had declined from the 'palmy days' there was no such reduction in average assay values of ores in depth as has since been apparent. It is true that this lower average was being shown in the New Almaden mine, then the main producer, but other mines were still yielding high-grade ores. This gradual decline in average value of ore may be best illustrated by the records of the New Almaden mine from the beginning to the time when the ore began to run below 2%, which would plat a descending curve, beginning with a content of 36.74% in 1850 to 1.93% in 1884. In recent years the average grade of the ore has been below 1% in this mine.

The following table shows the quicksilver production and prices at the end of each decade, beginning with initial operations in 1850:

Year.	Total production in flasks.	Average price per flask.
1850	7,723	$99.45
1860	10,000	53.55
1870	30,070	57.38
1880	59,926	31.00
1890	22,926	52.50
1900	26,317	44.94
1909	16,500	41.25

The highest price ever reached was $105.18 in 1874, when the output was 27,756 flasks.

QUICKSILVER PRODUCTION IN FOREIGN COUNTRIES.

Written for the MINING AND SCIENTIFIC PRESS
By H. W. TURNER.

The largest producer of quicksilver ore in the world is the Almadén mine of Spain, the product of which is controlled by the Rothschilds, who make the world-price. There is also a notable production in Austria and in Italy, and a smaller production in Russia, Asia Minor, Mexico, China, and Peru.

Mexico.—While quicksilver ores are common in Mexico, no large deposits like Almadén in Spain, Idria in Austria, Huancavelica in Peru, or New Almadén and New Idria in California, have as yet been reported. Probably the two most important districts are the Huitzuco in Guerrero and the Guadalcazar in San Luis Potosí. The Dulces Nombres quicksilver mine in San Luis Potosí was described by P. A. Babb.[1] This property lies 15 km. west of the railroad station of Enramada. About 14,000 flasks have been produced in the last 20 years from about 10,000 metric tons of ore, showing an average recovery of 4.7%

[1] *Eng. & Min. Jour.*, Oct. 2, 1909.

mercury. The mine was found in 1890. The ore occurs in widely scattered pockets and stringers in Cretaceous limestone, chiefly at points where the limestone has been crushed and slips have formed. The mercury is found mostly as cinnabar, but native mercury is also present, and in addition calomel, and the yellow ores, terlinguaite and egglestonite, oxychlorides of quicksilver, first recognized in the Terlingua district in Texas. The workings are dry. On account of the occurrence of the ore in scattered stringers and pockets the cost of mining is high, amounting to $1.40 per ton, while roasting costs $3.50 per ton. The ore is reduced in a furnace, and a 90% recovery is claimed. The ground thus far explored is about 400 metres long by 100 metres wide, and to the north and south of this area are about 1000 metres of promising unexplored ground. Mr. Babb regards the deposits as due to sublimation, inasmuch as there are practically no gangue minerals, such as pyrite, calcite, and the like, the mercury salts being the only foreign material. Moreover the limestone adjoining the deposits shows no alteration or impregnation by the mercury salts as should be the case if the ores were deposited from solution. There are no igneous rocks near the workings.

Italy.—The only important district yielding mercury ores in Italy is that of Monte Amiata. Nicou[2] reports that the chief producer was the Abbadia San Salvatore, which furnished 25,000 tons of 1% ore. There were 28 furnaces running, and an average recovery of 95.2% of the mercury in the ore was claimed. The average yearly production of Italy is given as 400 metric tons, and the average cost per flask of 75 lb. as about $33.

Peru.—The famous quicksilver mines of Huancavelica were recently described by L. W. Strauss.[3] The deposits are said to have been first made known by an archbishop in 1532, when the Indians were already mining and producing mercury. Under the Spanish Crown, operations began in 1571, since which time 1,498,434 flasks of 75 lb. have been produced, and Mr. Strauss believes that the recovery was very small, because of careless operation of the furnaces and their crude construction. Up to the present time, it appears that no modern furnace has been erected. The railroad from Callao now reaches to Huancayo, which is the nearest railroad point, and is 120 km. from Huancavelica. However, grading is now in progress to Iscuchaca, which is only 50 km. from Huancavelica, and a spur to the latter place is projected. On account of the scarcity of wood-fuel, llama-dung and straw were used in the quicksilver furnaces. Umlauff[4] reports coal deposits in Yanacelle mountain 15 km. south of Huancavelica, and at other points not far from the cinnabar mines. This fuel can presumably be used in the production of producer-gas. Moreover, oil has been found in quantity in Peru, and this can also be used as a fuel when the railroad facilities are improved. There is also said to be abundant water-power, and it is possible that the water could also be used for concentration of the cinnabar in the low-grade ores.

CALIFORNIA GOLD MINING.

Written for the Mining and Scientific Press
By An Occasional Correspondent.

No specially notable events are to be recorded in connection with gold mining in California during 1909, outside, possibly, of the discoveries of unusually rich ore in several re-opened mines in Sierra county. The discovery, two years ago, of 'candlebox' ore in one old mine, called attention to the district around Alleghany and Forest, and this led to re-exploration of other partly developed but long idle properties, all with successful results. The district is one in which both quartz and gravel mines are found, but the most important developments have been in quartz. The mines so far opened are of the class where some capital is needed, as they are all opened by adits. Aside from these no special developments of moment have occurred during the past calendar year. There have been numerous 'strikes' at different places and a number of new mines have been opened of more or less promise, but in general in the older districts of the State the work continues to be carried on in the usual manner, with perhaps a greater tendency to deep development.

The State of California has for some years produced between $18,000,000 and $20,000,000 in gold annually. The official records of the United States Geological Survey placed the gold output in 1908 at $19,329,700. These figures are the result of conferences between the officials of the Survey and those of the Bureau of the Mint. Preliminary inquiries this month show that to this amount may be added about $250,000 for the year 1909. It is highly probable that a gradual increase may be looked for of about a quarter of a million a year for some years. In taking an average of $20,000,000 per year, it may be said that the quartz mines of this State produced about $12,000,000, as compared with $8,000,000 from the placers. The tonnage of ore now being mined annually in California exceeds 2,500,000 tons, of which approximately 2,000,000 is silicious ore. The balance comes from the copper mines. The larger proportion of the silicious ore is derived from the five 'Mother Lode' counties of the State—Amador, Calaveras, El Dorado, Mariposa, and Tuolumne. In these counties the Mother Lode is wide and the grade of the ore is comparatively low. In other quartz-mine counties of the State the grade is materially higher, but the veins are narrower. The principal quartz-mine county of the State is Nevada, which leads all others in the point of production and has done so for some years. In this county the ores average in large quantity a little over $10 per ton, including the concentrate, and there is an apparent increase in the average value. Taking the whole State of California and considering the milling ore only, the average value per ton is only a little over $5.

There are about 1100 productive mines in the State; a few more placers than quartz mines. The hydraulic mining industry shows a gradual falling off in output each year; mainly owing to restrictions placed upon this industry by the Federal mining laws in the drainage basin of the Sacramento and San Joaquin rivers. In the northwestern counties of

the State—Siskiyou and Trinity—hydraulicking still flourishes, as the restrictive laws do not apply. Drift mining does not appear to be prosperous of late, and the gold from that source seems to be falling off in quantity each year. It is possible, however, that there may be a change in this respect, since in the counties of Sierra, Plumas, and Butte a number of new drift mines are being opened and old ones reopened. Surface placer work, somewhat strange to say, is increasing. This may be attributed to the fact that from the long cessation of hydraulic mining on a large scale the mountain and foothill streams have been more or less cleared of débris so that more places are now available for river and gulch mining.

The increase of gold production in California in recent years is due almost entirely to gold dredging operations. The dredges are now producing something like $5,000,000 each year more than the hydraulic, drift, and surface placers combined. Since dredging commenced on a small scale in 1898 these machines have dug out about $32,000,000 in gold, and in 1909 it is supposed they took out by dredging considerably more than $7,000,000. There are now about 70 machines at work in this State. These are operating in the counties of Butte, Calaveras, Merced, Stanislaus, Sacramento, Shasta, Siskiyou, Trinity, and Yuba.

The principal dredging fields now worked are at Oroville, Butte county, Folsom, Sacramento county, and Marysville, Yuba county. The machines constructed within the past few years are of large capacity and great strength, so that material is now being handled at a much less cost per cubic yard than was formerly the case. Those interested in this class of gold mining are constantly on the lookout for new ground which is suitable for the purpose. Certain combinations of large companies in the principal fields have materially cheapened cost in the matter of management, and the whole industry is in a prosperous condition. Dredging requires large investment in both land and plant and cannot therefore be considered a poor man's system of mining. There are now 31 counties in the State producing gold, of which seven are yielding over a million dollars per year. One of them is yielding over $3,000,000, and two others are yielding over $2,000,000. The largest output of gold is now derived from Butte county, where the greatest number of dredges is employed. The next county in rank is Nevada, which derives most of its gold from quartz mining operations. It is notable that three of these seven counties, yielding over a million dollars per year, are dredge mining counties—Butte, Sacramento, and Yuba. Not much more than ten years ago this class of mining was unknown in California. In hydraulic mining, Trinity county shows the largest returns, and the principal drift mines are in Placer county. In ordinary surface or sluicing mines Siskiyou county has the lead. The largest output of silicious ore continues to come from Calaveras, one of the Mother Lode counties.

The increase of electric-power plants throughout the State has had a marked effect in the mining regions. The numerous mountain streams furnish the original source of power, and this is distributed by electricity throughout the various mining districts. This has had the result of materially cheapening mining operations and rendered possible the operation of mines which were formerly idle. It may be said generally that it is now much easier to obtain capital for investment in the gold mines of this State than has been the case for some years. The success of deep development in the Mother Lode region, the Kennedy having reached nearly 3500 ft. of vertical depth, has induced others to continue sinking.

Dredging Grounds on Yuba River.

It may be said, speaking generally, that gold mining is in an excellent condition, and that it is probable there will be a gradual increase in annual output for some years to come. It is to be noted that the speculative feature, in the sale of stocks, is almost entirely absent in connection with the California gold mines. Most of them are worked by private corporations and no transactions are to be noted in the stock exchanges of the country. In the case even of the larger mines it is somewhat difficult to obtain any detailed information as to operations, for the owners considered these matters to be private, and publicity is carefully avoided. Lack of space prevents any extended review which would cover operations during the past year in the many gold-mining counties. Developments in progress have been duly recorded weekly and notation has been made of any marked incidents. The gold miners of California are to be congratulated on the progress that they are making and on the good record shown in a State where gold mining has been carried on constantly for the past 60 years.

IDAHO, OREGON, AND WASHINGTON IN 1909.

Written for the MINING AND SCIENTIFIC PRESS
By L. K. ARMSTRONG.

In Idaho, in the Coeur d'Alene district, the report of the Mines Employment Bureau shows that 3600 men are on the pay-roll of mines. In addition to this there are, perhaps, as many more employed in the State at large. The lowest wage paid is $3 for muckers, but the mine wage, generally, is $3.50 per day. The Federal company has 1300 men on the pay-roll continuously, followed by the Bunker Hill & Sullivan with about half that number. The destruction of the Hercules mill by fire early in the fall reduced the working force to about half the regular number, 125 men being on the pay-roll at that time. Of the other large mines of the district the number of men employed is shown below: Hecla, 167; Snowstorm, 135; Gold Hunter, 70; Caledonia, 45; Alice, 28; Monarch, 20; Monitor, 20; Interstate and Lucky Calumet, each 15; Bear Top, Jack Waite, Star, and Friseo lease, 12 each; Great Western, Tamarack & Chesapeake, Ivanhoe, Imperial, Idaho, 10 each; with smaller properties making up the balance.

The dividends and estimated distribution of profits of these mines for the year are shown below:

Federal group	$ 720,000
Bunker Hill & Sullivan	570,000
Hercules, estimated	317,500
Snowstorm	202,500
Hecla	190,000
Total	$2,000,000

This same group, making a report to the County Assessor for the year ended May 1, 1909, claimed a net profit of $2,487,988.76, as shown below:

Federal group	$ 931,588.00
Bunker Hill & Sullivan	901,701.50
Hercules	383,751.89
Snowstorm	162,148.56
Hecla	108,798.81
Total	$2,487,988.76

According to the annual report of the general manager of the Snowstorm the total net cost of copper production after deducting the silver was 10.115c. per lb., showing a net profit of 3.159c. per lb. The ore averaged 6.394 oz. silver and 4.508% copper. The metal was marketed without any apparent cost for treatment, the silica of the ore causing it to be used for lining the converters. The burning of the Hercules mill in the fall of 1909 reduced the production of that mine for the remainder of the year, and affected the production of the district, the total value of which was not far from $15,000,000 in all metals. Monarch, Bear Top, and other North Fork properties, have profited by the building of the Idaho Northern railroad, and some shipments have been made. Assessment levies have kept several of the smaller non-productive properties of the district in steady operation. The year as a whole has been progressive. Plans are outlined for extensions of the Idaho Northern railway, and the Chicago, Milwaukee & St. Paul contemplates building into the district next year.

On the Montana side the Monitor copper mine and other smaller properties will begin shipments next year, ore being blocked and ready to move. At the beginning of December the old Continental mine, in Bonner county, which has an enormous exposure of low-grade lead-silver ore at the surface and in the shallow workings, passed into the hands of Spokane people who are preparing for early shipments. Around Priest lake and Lake Pend Oreille, there has been considerable development of the copper-bearing and silicious gold-ore mines, encouraged, no doubt, by the promise of local treatment in the smelter near Sandpoint. There are also a few silver-lead mines undergoing development around the latter named lake, in the Clarks Fork region.

Central Idaho gold districts have not enjoyed that measure of prosperity which might have been expected. Operations at the Buster mine and mill, near Elk City, created an impression of distrust, and but little outside capital found its way into the gold districts. However, there were a few notable exceptions to the generally dull conditions. The Mines Co., Ltd., a Spokane corporation, took over the Crackerjack and other Buffalo Hump mines and installed a large amount of additional milling and other machinery looking to permanent operations. At Dixie the Penn-Dixie company purchased, installed, and started operations with a mill. Previous development warranted this and information is received indicating a successful run. Dredging in the Elk City district was started with two dredges, one of which was entirely new and the other had undergone some extensive remodeling and repair. They are ready for an early start in the spring. At Newsome the Iron Crown mill was run for a few months, netting several thousand dollars. This having been the first season, the new owners planned no

The Coeur d'Alene, Idaho.

work ahead, but next year they expect to operate on a larger scale. Both dredging and hydraulicking in the Pierce district were profitable. The most important quartz development in that district was by the Ozark Mining & Milling Co. which consisted in completing the cross-cut adit which had a length of about 1200 ft. and cut the vein at a vertical depth of over 500 ft., finding ore similar to that near the surface.

Oregon.—The first half of 1909 was exceedingly quiet in the northeastern part of the State, but several old properties resumed operations later, a few were brought into production, and new capital was interested in other cases. This all related to gold mines. The large copper properties, such as the Indiana, did almost nothing. The old Cougar property was opened and new machinery added to the cyanide plant, but deficient capital left unpaid bills and the mine was closed. The Sumpter Valley railway from Austin to Dixie was extended late in the fall, but no regular trains will be run until spring.

Washington.—Stevens and Ferry counties enjoyed the best year in their history in some respects. Shipments were not so large from several of the mines, but development was more extensive. The approach of the I. & W. N. railroad to within about eight miles of Metaline, with assurance of entry into the camp early next year, has given impetus to the development of the mines there. With a few exceptions these mines carry ore high in lead and low in silver, with a lime gangue. There are exceptions to this, however, a few carrying ore high in silver, and others with copper, gold, and silver, all silicious. If, as reported, this road is to be extended to Trail, B. C., the ores can go there, or they can go to American smelters.

At Chewelah development only has been in progress, the United Copper people preferring to hold their ore until better prices prevail, and the other properties not being advanced far enough to make continuous shipments, if any. Development on the United Copper has been satisfactory. The oreshoots have been systematically opened, and a new one cut in the upper works on a parallel vein. The lower adit, which is being projected to cut the vein-system several hundred feet below the old workings, has cut one vein of some importance, but is still several hundred feet from the objective point. The Jupiter company, operating the Last Chance mine, near Northport, has made the usual shipments to Joplin, Mo., estimates of which are not obtainable. Diamond-drill work on the Sunset was continued for the greater part of the season. About midway between Marcus and Orient, the B. C. Copper Co. has had the Napoleon under operation almost continuously, shipments being made to the company's smelter at Greenwood, B. C. This company has also the Lone Star and Washington mines, both in Ferry county, neither of which has produced much ore. The property which has made Orient has been the First Thought, a gold mine owned by P. Burns & Co., a Canadian corporation with some stock held outside. This mine has been in almost steady production for four or more years, but has never had a large ore reserve. The production has been not far from 40 tons per day during the productive period, and the ore has been reported to average between $10 and $20 per ton in gold. These figures have been considered low, but with the exception of some high-grade ore found at intervals it probably represents about the correct value. Recently the company has procured a diamond-drill and has explored a large new territory, with excellent results. This is the first attempt to create reserves, but it is believed that hereafter the company will keep prospecting well ahead of development, and that ahead of mining. It is stated on good authority that this mine, the Northport smelter, and other interests, are to be consolidated under a single management with a view to large operation.

The old camp of Republic, in Ferry county, whose two railroads netted a heavy loss to their owners each year, has been revived and some of the mines are in steady operation. Among these are the Republic, Blacktail, Quilp, and Lone Pine-Surprise. The Belcher, a few miles north of Republic, is a steady producer, having shipped a large tonnage the past season. With the exception of the last named, however, the final solution has not been reached, as only enough ore is accepted by the smelters to fill the demand for converter-lining. It is to be regretted that some concerted action is not taken to solve the local treatment problem. It is believed that finer grinding, that is, re-grinding by tube-mills or Chilean mills, would permit better cyanide extraction, but no attempt has evidently been made to work this out. West of Republic, at Chesaw, and to the south and southwest at Keller, Nespelem, Park City, and other points, greater activity has been evidenced than during the previous year, in some instances with favorable results and in others with less encouragement. These camps are without railway connections, and in consequence do not attract operators as would otherwise be the case.

In Okanogan county, west of the Okanogan river, the Nighthawk mine, not far from Nighthawk, has been in operation nearly all the year, milling ore and shipping concentrate. A number of other mines are under development. The Palmer Mountain enterprise, in the hands of new men, is attempting to discover some orebodies beyond the face of the 4000-ft. tunnel which was such a colossal failure. It is hoped that the new manager may be able to reach the known orebodies found in the upper levels of the mines on the other side of the mountain, nearly 1000 ft. ahead of the breast of the Palmer Mountain tunnel.

Without mentioning enterprises where work has been undertaken or continued without notable results during the year, the Arlington mine, near the site of the old town of Ruby, has been explored by a cross-cut adit at the 450-ft. level, and a large body of high-grade silver-copper-lead ore has been cut and driven upon. Judgment having been rendered in favor of J. H. Holden, by the Washington Supreme Court, the company having the Holden mine under bond, and which has expended a large sum of money in its development, will now be able to secure good title. Diamond-drill operations have disclosed a large body of low-grade copper-gold ore.

COKE AND IRON IN THE MIDDLE WEST.

Written for the MINING AND SCIENTIFIC PRESS
By GEORGE H. CUSHING.

The year has been especially prolific in development regarding coking Western coal, and this promises to become important. The United States Steel Corporation has about completed its new mills at Gary, Indiana, and has constructed in connection therewith four batteries of 70 ovens each, and purposes ultimately to have eight such batteries, with an average productive capacity of 13 tons each in 24 hours. Previous to the establishment of these plants, the Steel Corporation erected an experimental oven at the works of the Illinois Steel Co., at Joliet, using in it a mixture of two Eastern coals. The principle feature of that oven is the regenerative furnace, which permits a quick high temperature for the treatment of all coals. It had previously been discovered, by R. S. Moss, that the quick high temperature in a beehive oven would crack the lighter volatiles of the Illinois coals, and by the production of heavy hydro-carbons permit the coking of almost all and the manufacture of a metallurgical coke from certain coals from the southern part of the State. Inasmuch as the Koppers ovens at Joliet use the same principle, it is now considered entirely possible for the Steel Corporation to make coke from Illinois and Indiana coal. Experiments with that end in view have been made within the year by the Illinois Central railway, the United States Steel Corporation, W. P. Rend, and others, and it is understood that all have reached the same conclusion, that is, that coking of Middle West coal is possible. Since the Steel Corporation has already bought the Kelly properties, which are conceded to be capable of producing a coking coal, and since the J. R. Walsh properties are now being taken out of the hands of a receiver and are known also to produce a coal that will coke, and since the Dering Coal Co.'s mines are now in the hands of a receiver and soon to be reorganized, and since they also produce a coal capable of coking, some important developments are expected within the next year or two. W. P. Rend expects to build a battery of ovens in connection with his Franklin county mines within the coming year, and the Illinois Central railway, to avoid conflict with the city of Chicago on the smoke question, is now undertaking to use coke in its terminal engines. It may produce the coke from its own mines in the southern part of the State.

As to another phase of the mining industry, namely, the iron ore and pig iron situation, quite a satisfactory state of affairs obtains. The statement of the production of the iron ore in the Lake Superior region is of interest, not only because of the volume but also because of a change in the source of supply. The total shipments of iron ore from the Lake Superior territory will exceed by a few thousand tons the shipments for 1907, which were, in round numbers, 42,000,000 tons. To December 1, Lake ore shipments amounted to 41,164,359 tons, to which will probably be added in December at least 350,000 tons. This is highly important in view of the fact that in 1907, the Lake Superior ores were just about meeting the demands of the existing furnaces, and did not take into consideration the enormous absorptive capacity of the new mills of the United States Steel Corporation, at Gary, Indiana. The production of 1907, furthermore, took into account only part of the demands of the new mills of the National Tool Co., at Lorain, Ohio. Since 1907 the Bethlehem Steel Co. has arranged to go extensively into commercial lines and is no longer specializing upon armor plate. Jones & Laughlin have added to their billet and bloom capacity to provide the raw steel required by extended chains of rolls. The Lackawanna Iron & Steel Co. has increased its furnace capacity somewhat, in addition to which the merchant furnaces in the valley and especialy along the south shore of Lake Erie have increased materially, to say nothing of the tremendous absorptive capacity of the new steel mill of the Steel Corporation at Gary, Indiana. Taking all these things into consideration, it must be apparent that the maximum movement of iron ore from the Lake Superior region of even 42,000,000 tons is going to be somewhat short of requirements provided we have a demand for all the pig iron that could be produced. It is understood that stocks of ore on the docks on the south shore of Lake Erie and at the furnaces themselves are not plentiful. This fact assumes a new importance when it is known that a number of the steel mills are now sold up to their capacity for the next three or four months. In the Chicago territory a number of the plants which have withheld their capacity from contracts to obtain the advantage of the open market are now so congested with business that they have been compelled to refuse new orders even at premium figures. The situation becomes more interesting, and possibly significant, when it is known that the railroads of late have been placing record orders both for track supplies and for rolling stock. This action has been due to railroad facilities having fallen short of commercial requirements in the central western territory, and liberal extensions are necessary. This situation harks back to the ore movement because the railroads cannot improve their facilities until they get cars or rails; the car manufacturers and the rail mills cannot supply those demands until they get raw steel; the billet and blooming mills cannot meet the demands upon them until they get the pig iron, and the blast-furnaces, of course, can operate only as they obtain the iron ore. In the meantime the supply of ore is 7,000,000 tons below that of 1907.

There were two reasons for the partial paralysis of the Lake trade early in the season, one of them being the absence of any marked recovery of general business for this year, and the other being the difficulties of the members of the Lake Carriers' Association with all forms of labor on shipboard, starting in with the Marine Engineers' Beneficial Association. At the beginning of the season the vessel owners were willing to accept the challenge of organized labor, since they knew no urgent demand for boats existed and any immediate opening of navigation would cause a rapid decline in freight rates. The vessel owners had been waiting a long time for an opportunity to deliver a body blow to what they considered autocratic labor unions. A running fight developed, and

extended over most of the season of navigation. Its principal result was the almost complete paralysis of Lake business up to the first of June. That, of course, took out of the market the vessel-carrying capacity for a good part of April and all of May, and resulted in crippling the fleet to a certain extent through the year. Furthermore, there was no active demand for iron ore until the opening of the fall trade, the first appearance of returning business coming about August 15 or September 1. As a consequence the movement of iron ore was jammed into the last six months of the year.

A further matter of no mean importance is the increasing percentage of the iron ore from Duluth, Superior, and Two Harbors, with a similar decrease in the movement from Marquette and Escanaba. This means a change in the character of the ore shipped from the Lake Superior territory. In other words, it means that the Mesabi range is rapidly becoming the main reliance of the iron and steel industries, and the old-range ores are less important. This is in some regards the most important development of the entire Lake trade, because, with the possible exception of the content of phosphorus the predominant ores shipped from the Lake Superior territory now grade closely to those coming from Port Arthur and Michipicoten on the Canadian side. As far as metallic content is concerned, they grade evenly with some of the Southern and Western ores. The change in ore movement corresponds to the increase in open-hearth or basic-steel production. In this connection the report of the American Railway Association favoring the use of basic steel rails may be noted. In view of the fact that the centre of the steel production is now broader, and in view of the further fact that the Pittsburg territory is far from controlling the whole of the steel trade now, this means a broader base of supply for iron ore, and marks a centrifugal tendency in steel production.

As to pig-iron production in the central western territory, it can easily be seen that this is not dependent now so much upon the wish of the producers themselves, or upon the demand of the market, as upon the supply of iron ore available.

LAKE SUPERIOR COPPER MINING, 1909.

Written for the MINING AND SCIENTIFIC PRESS
By ROBERT H. MAURER.

There have been years in the history of copper mining in the Lake Superior district that, viewed from a dividend standpoint, have been more successful than the year just closed, but in the production of copper the year leads all by a wide margin. In other respects 1909 was a normal year. During the year there was produced, as nearly as can be calculated, 236,335,700 lb. of fine copper, compared with 222,674,918 in 1908, 216,116,747 in 1907, 229,632,608 in 1906, and 230,437,992 in the banner year 1905.

The year opened with 19 producing companies, and closed with 17 maintaining regular production, the Keweenaw Copper Co. dropping from the ranks of the producers in March, and the Michigan Copper Mining Co. following in the month of October. In the mat-

ter of dividends disbursed there is small cause for complaint, considering the prevailing low prices for the finished product. The average price per pound realized during the year was 13.31c., compared with 13.33 during the previous year, 20 during 1907, and 19.61 during the banner dividend-year of 1906, and is with two exceptions the lowest price recorded in ten years. Dividends were earned and disbursed by seven of the companies, and totaled $6,309,200 for the year. In 1908 there were eight dividend payers and a total of $4,837,300 was disbursed. Total dividend disbursements in 1907 reached $13,469,950, and in 1906 the amount disbursed was $13,911,500.

Labor conditions were ideal. Work was plentiful, and the wage scale satisfactory to employer and employee. With the exception of the Quincy Mining Co., which faced a labor strike of short duration early in the year, capital and labor worked in harmony. The number of men employed in the various branches of the industry was about normal. The growth of the industry has been remarkable, and it is doubtful if there be another mining field on the globe that can show greater advancement over a period of time so great as that in which the Lake Superior copper mines have been worked. Although

an English company made an attempt at mining along the Ontonagon river in the southern end of this district as early as 1770, the history of copper mining in historic times really begins with the organization, in 1844, of the Pittsburg & Boston Mining Co., the first producer and also the first dividend payer of the district. The company operated the famous Cliff mine of early days. Progress since 1844 has been steady. Production at no time fell off more than 10% from the high mark of any previous year, and in 60 years has grown from 1,505,280 lb. to around 235,000,000 annually. A table showing the yearly output in pounds avoirdupois and the dividends paid every fifth year since 1849 is appended herewith.

Year.	Copper, Pounds.	Dividends.
1849	1,505,280	$ 60,000
1854	4,074,560	198,000
1859	8,937,995	360,000
1864	12,491,965	1,150,000
1869	26,625,301	210,000
1874	34,334,389	1,940,000
1879	42,671,529	1,818,620
1884	69,353,202	1,327,500
1889	88,175,675	2,670,000
1894	114,308,870	2,380,000
1899	146,950,338	12,318,450
1904	208,329,248	5,432,300
1909	236,385,700	6,309,200

The total production of copper reaches approximately 4,950,000,000 lb., and the total dividend disbursement stands at $174,655,370. The following table shows the total dividend payments of the several companies:

Mine.	Total dividends.
Atlantic	$ 990,000
Baltic	5,550,000
Calumet & Hecla	108,550,000
Central	2,130,000
Champion	5,700,000
Cliff	2,518,620
Copper Falls	100,000
Franklin	1,240,000
Kearsarge	160,000
Minesota	1,820,000
Mohawk	2,050,000
National	320,000
Osceola	8,381,750
Pewabic	1,000,000
Phoenix	20,000
Quincy	18,105,000
Ridge	100,000
Tamarack	9,420,000
Trimountain	800,000
Wolverine	5,700,000

The increase in production was greater last year than it was in 1908, due principally to the greatly increased outputs of the Ahmeek, Isle Royale, Osceola, Champion, and Baltic mines, a further contributing factor being the Superior mine, which alone added nearly 2,000,000 lb. to the total production of the older companies. The Calumet & Hecla output was the smallest recorded in five years, the decrease amounting to about 5,000,000 lb. from the average annual production of that period. The Franklin output also decreased by about 1,500,000 lb. from the preceding year, the smaller production being due to two causes, the sale of the old Franklin mine to the Quincy company, and the curtailment in and final abandonment of the conglomerate mine, leaving the company with but a partly developed mine on the Pewabic lode to draw upon. The Michigan mine yielded a regular production during the first ten months of the year, after which operations were suspended, owing to the not altogether favorable conditions existing underground, coupled with the prevailing low prices for the finished metal. Better conditions in the metal market will again see the Michigan among the regular producers of the district. The Mandan mine of the Keweenaw Copper Co. proved a dismal failure, and probably will not figure as a producer for many years to come. The Superior rounded out her first year as a producer and has more than met expectations. This mine promises a greatly increased production for the new year and will be numbered among the best of the district in the near future. Among other possible new producers are Lake, La Salle, and Gratiot. The first named has opened a wonderfully rich copper deposit, and will probably become one of the largest producers of the district. The La Salle and Gratiot also are in shape to maintain a steady production, but for the immediate future the outputs of these properties will be rather limited. In the following table is given an estimate of the production in pounds of fine copper of the several Lake Superior mines for the year 1909, as also the actual figures of production for the two preceding years. The estimates are based upon the most reliable data obtainable. Official figures will not be available for quite six months to come.

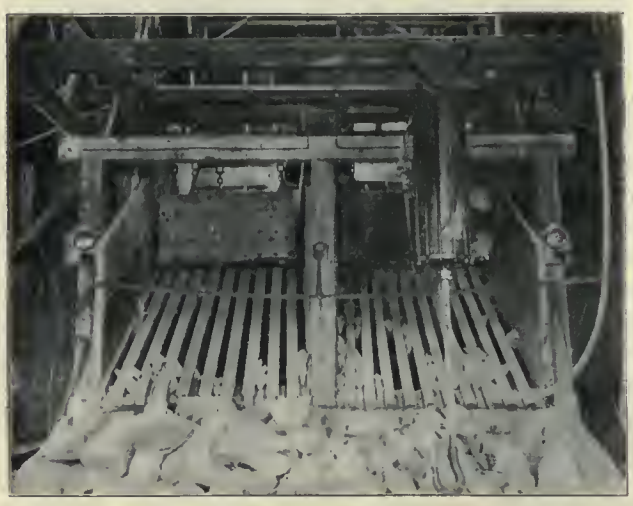
Totals	236,385,700	222,674,918	216,116,747

First and foremost among the mining companies of the Lake Superior copper district is the Calumet & Hecla, with a dividend record of $109,600,000 paid since its organization in 1871. Dividend disbursements made prior to that time by the original Calumet and Hecla companies, of which the present company is a consolidation, amounted to $950,000 additional, and brings the total dividends earned in these operations to well over $110,000,000. During the past year the company disbursed $2,700,000. The largest amount paid in any one year was $10,000,000, which amount was paid in 1899. The com-

pany is primarily a producer of copper, but in more recent years has acquired a considerable interest in other copper producers of this district, and has now become practically a securities holding company, virtually owning and controlling 15 Lake Superior mining companies, giving the Calumet & Hecla the control of upward of 140,000,000 lb. of copper annually out of a total production of about 235,000,000 for the district. Of this amount approximately



Grizzly at Trimountain Shaft.

80,000,000 lb. is secured from operations in its own mines on the famous conglomerate bed and the Osceola lode. Developments in the conglomerate mine show a steady decrease in copper content with depth, and the average recovery of fine copper per ton is now about 35 lb., compared with 80 secured not over ten years ago. Operations in the so-called

Ingots ofCopper.

Black Hills mine of the South Hecla branch resulted in the disclosure of commercial copper ore in ground that was generally looked upon as unpromising, and this should add materially to the life of the company on that end of the conglomerate bed. Development in the Osceola amygdaloid continued without interruption, and the tonnage now opened there is estimated at 15,000,000 tons. This lode is now yielding about 15% of the Calumet & Hecla production. Developments in the Kearsarge lode show no material betterment over past years, and were in the main satisfactory.

The exploratory operations of the company were centered in the exploitation of the Nonesuch lode in the Ontonagon district, and the results there obtained have induced the organization of a mining company to develop the lands carrying this lode. The Calumet & Hecla will own about half of the shares of this company, and will finance and direct the new company. Litigation growing out of the attempt of the company to vote the stock held by it in the several so-called Bigelow companies has been satisfactorily settled in favor of the company, and the control of those properties is now with the Calumet & Hecla.

The Copper Range Consolidated Co., strictly a securities holding corporation, owning and controlling the Baltic, Champion, and Trimountain copper mines, and the Copper Range railroad, stands next to Calumet & Hecla in point of production. The mines operated by this company yielded approximately 44,000,000 lb. of copper during 1909. In 1908 the production was 41,546,525, and in 1907 the output was 41,385,015. Dividends paid during the year amounted to $1,536,740, the Baltic contributing $1,000,000, the Champion $250,000, an equal amount going to the St. Mary's Mineral Land Co., part owner

Mass Copper at Champion Mine.

of that mine, and the railroad $260,000. Trimountain contributed nothing. This mine has long been the 'weak brother' of the trio, and where the production of the Baltic and Champion mines has steadily increased from year to year, the output of the Trimountain has been severely decreased. In the five-year period just closed the annual production of the Trimountain has fallen from 10,211,230 lb. in 1904 to around 6,000,000 for the year 1909. The decreased production is directly traceable to leaner copper ground opened at depth, though developments in the past year show a decided improvement with further depth, and better results in the future are indicated. The Baltic and Champion are in excellent physical condition and continue to yield increased productions with each succeeding year. Both are producing at about the same rate and each is at present yielding slightly better than 19,000,000 lb. annually, compared with productions of 12,177,729 and 12,212,954, respectively, in 1904. The exploratory operations of the company on the so-called Globe tract proved unsuccessful, and all work there was stopped early in the year. Explorations were thereafter centered in

the Canal lands lying to the westward of the three properties, and considerable diamond-drilling was done without disclosing mineralized ground of a character that would warrant shaft-sinking. This work has also been stopped, and the option under which the lands were held relinquished.

The activity of the Osceola Consolidated Co. is reflected in the greatly increased production, which for the year 1909 approximates 25,000,000 lb. of fine copper, and is the greatest annual production recorded in the history of the company. Early in the year the control of this property passed to the Calumet & Hecla, and under the new management many economies in operation are being effected. Dividend disbursements amounted to $769,200, an increase of $576,900 over the preceding year. Developments underground, in both the Osceola and Kearsarge branches, reveal a continuity of ore with depth, and in some of the upper reaches of the North Kearsarge mine further good copper-ground has been found in territory that had long been abandoned. In the South Kearsarge all development has been practically completed, and that mine is now in shape to produce at an extremely low cost. The new shaft-sinking on the north end of the Kearsarge branch was equipped with permanent machinery and is now yielding a regular production.

The Quincy Mining Co., finished the year in fourth place among the producers of the district, with a production greater by about 1,000,000 lb. than was had in the preceding year, despite the temporary loss of one of the four producing shafts operated by the company. The shaft was put out of commission by falling rock, accompanied and caused by air-blasts in the older workings of the mine, and was practically unavailable for hoisting copper ore during the last two months of the year. The air-blasts are unexplainable, and have been of rather frequent occurrence in recent years, but never so severe and lasting in effect as those experienced recently. The development work of the company was confined to the so-called Pontiac tract, in the extreme northern limits of the property, and good progress was made. One shaft is sinking there to open and develop the Quincy-Pewabic lode upon which the old mine is opened, and will be a material aid in keeping the Quincy among the leading producers of the district. The Tamarack, Mohawk, Wolverine, and Allouez companies operated with much the same results as in past years, all keeping reserves well ahead of immediate requirements and maintaining normal productions. The most important development in the Tamarack affairs was the proposal made to the stockholders to set aside the old Cliff lands under a separate corporation, and use the proceeds from the sale of stock to liquidate the company's large indebtedness. Mohawk began the development of the southern end of its property by sinking a shaft thereon, and a rich producer will probably result, judging from the uniformly rich ground opened in the Ahmeek mine adjoining. The situation in the Wolverine is unchanged from past years, and that mine continues to be the second richest producer among the mines of the district, though closely followed by Ahmeek and Superior, in the order named. Allouez succeeded in getting the second shaft down to the lode and is now a two-shaft mine, and in shape to easily double the present rate of production, though there is little likelihood that this will be done this year. Ahmeek and Isle Royale continued with the development begun in the preceding year, and both secured greatly increased productions. Two new shafts on the Ahmeek property are being sunk to open the underlay of the Kearsarge lode under the Mohawk mine, and are expected to be in that ground before the end of the year. This company is developing some of the richest ground opened in the district. The new stamp-mill is nearing completion, and should be ready for service about the middle of the year. Isle Royale obtained a fair average showing of copper ground in the Isle Royale lode, but because of the irregular distribution of the ore, and the condition of the metal-market, later curtailed operations in this bed. Operations there are again being increased and a renewed activity is promised for the new year. Developments in the Baltic lode disclosed a small amount of copper at various depths in the single shaft opened there, but results in general are rather negative in nature, though a marked improvement is taking place as driving in the direction of the Superior mine, now under way, progresses.

The situations at the Centennial, Franklin, Mass, and Victoria mines are unchanged. All are yielding small productions, and with the exception of the first named are still in the prospect stage. There is every indication that both Centennial and Franklin will yield a steadily increasing production and the dividend period cannot be far removed. Mass and Victoria are barely getting a new dollar for each old one expended, and unless there is a decided improvement in the metal-market the prospect for dividends will remain far removed. Both companies are working in extremely low-grade ground, yielding less than 12 lb. of fine copper per ton of rock, and with no permanent improvement in the copper-content of the newer ground under development.

Superior rounded out its first year as a producer, and is coming along at a good rate. Production for the year approximated 1,800,000 lb. of fine copper. Developments in the mine continued to show steady improvement at all points, and a second shaft has been started on the south end of the property. A production of at least 3,000,000 lb. of copper is predicted for the new year, and will increase annually, but it will be several years more before dividends can reasonably be expected.

Michigan and Keweenaw, owing to adverse conditions in the mines, stopped production during the year, and are both engaged in exploratory work. The Michigan has a mine fully developed and equipped, which in the upper levels was exceptionally rich, and gave great promise for profitable operation, but at depth the lode has shown a tendency to narrow and grow lean, and for that reason mining operations were curtailed and an attempt made to find more profitable ground. Keweenaw ceased production early in the year, the Mandan mine, in which mining operations were confined, proving too low in grade to warrant the expenditure of further time and money in an effort to make it a

profitable producer. The company is now conducting exploratory work in the Kearsarge horizon, which has yet to record its first failure, and may add a new mine to the long list already opened on that copper-bearing bed.

Among the non-producers that give promise of early production, and may even now be considered more than prospects, are the Lake, the Hancock, the King Philip, and the Winona mines. The La Salle, and possibly the Gratiot, may also enter the ranks of regular producers within the next year or two. Of these the Winona and King Philip will probably be the first, a stamp-mill for the joint use of these mines already being under construction. Both are opened in the same lode, and continue to open average good ground. The Hancock has developed a considerable tonnage of exceptionally rich copper rock and should prove one of the best amygdaloid mines in the district. Lake continued with the development of the now famous Lake lode, and has already developed about 3,000,000 tons of copper rock of extraordinary richness. Developments during the year were of a sensational character, and indicate that this mine will rank next to the Calumet & Hecla conglomerate mine in point of richness. The La Salle abandoned one shaft and started another, and in the Tecumseh tract it will have a mine of average grade. Its prospects in the Caldwell tract are not so bright. Gratiot continued development with rather indifferent results, and probably will be numbered with the low-grade mines of the North Range. The prospects of the district are many, and include some promising properties, among which the Ojibway, operating on the Kearsarge lode, the Atlantic on the Baltic lode, and the Adventure on the so-called Adventure lodes, seem the most satisfactory. All are conducting development by means of shafts and lateral underground openings, and with the exception of the last-named are securing quite encouraging results. The Adventure's shaft has yet to reach the lodes to be opened in this work, and probably will not get into the copper ground until well along in the new year.

The operations of the North Lake, the South Lake, and Indiana companies are centered in diamond-drilling in an attempt to pick up the extension of the famous Lake lode. The New Baltic has succeeded in finding what may prove to be an extension of the Superior lode, well charged with copper, and the Oneco is diamond-drilling in an attempt to find the same or other copper-bearing lodes of commercial value. The old Oneco lode was cut in this work, and a fair showing of copper was obtained. Laurium is engaged in shaft sinking in the Kearsarge lode, but the work has not progressed sufficiently to indicate its possibilities, though the same should prove equal to those held out for the adjoining La Salle. Seneca has opened the Kearsarge lode by a shaft and by cross-cuts and drifts, but results are discouraging. Mayflower is making what may be the last attempt to find commercial ground upon its property, and the Old Colony, next on the south side, and likewise engaged earlier in the year, has suspended operation and is now idle. The Rhode Island operated the greater part of the year with poor success. Control of the property passed to the Franklin company, and the property is idle. Elm River and Wyandot are opening their respective properties at depth by means of cross-cuts in an effort to find a copper-bearing bed among the dozen or more lodes traversing these properties, and the efforts have in a measure been rewarded, but though some copper-ground was exposed in this work, results on the whole have been rather discouraging. The old Arcadian company was reorganized, and the work was begun on the property late in the old year. The efforts of the New Arcadian company are centered in the exploitation of the eastern portion of the property, all practically virgin territory, and presumably carrying the strike of the Kearsarge and Baltic lodes.

All in all the past year was not very different from the preceding. There have been other years of greater activity in which the productive capacities of the mines were forced to their limits, and years in which the total dividends disbursed exceeded the amount paid in the past year, and though the total output of copper exceeds that of any preceding year, the increase is but the natural result of work done in the past. The productive limit of the Lake Superior district has in no wise been reached, and the known mineral resources have materially increased through the exploratory operations of the several companies during the year just closed.

Pig iron is now being manufactured in California. The final blowing in and operation on a commercial scale by the Noble Electric Steel Co., of its plant on Pit river, above its junction with the McCloud, was one of the important events of the year. The Noble company has been experimenting with the Heroult process for the past three years. A small furnace with several charcoal kilns were first constructed by a French metallurgist, but the heat was too intense and the current too irregular for successful work. Later the plant was remodeled by A. D. Lyon, professor of metallurgy at Stanford University, and pig iron produced. The furnace was then enlarged and the current turned on, but the carbon electrodes disintegrated. They have now been replaced by graphite pieces 9 in. diam., built in segments so any desired length may be obtained. The iron has been used in the local foundries and pronounced of excellent grade. The possible influence of this work on the future utilization of local ores, and the development of manufacturing on the Pacific Coast, is immeasurable.

Coal.—For 1909 the coal production of Utah shows an increase of 15 to 20% over that of 1908. Quite a number of new companies have been operating for the first time during the year. The Utah Fuel Co. leads in output, with nearly 2,000,000 tons. The Union Pacific, Pleasant Valley mine at Schofield, the Consolidated Fuel Co.'s mines at Hiawatha, the Independent Fuel Co.'s at Kenilworth, the Wasatch mine at Coalville, and a number of others have produced around 600,000 tons of coal during the year. Owing to the closing of a number of copper smelters, and to other difficulties, the coke production shows a decrease of from 30 to 40% over 1908.

MINING IN ALASKA IN 1909.

The annual report on the mineral resources and production of Alaska for 1909 is now in preparation under the direction of Alfred H. Brooks, of the United States Geological Survey, and will be published about the middle of May. The more important features of this report are abstracted in the following statement. Accurate statistics are not yet available, but the estimated value of the output of gold here given is probably less than 4% in error; that of the copper output less than 15.

Mineral Production.—The value of the mineral output of Alaska in 1909 is estimated at $20,200,000, practically the same as that of 1908, which was $20,139,272. The estimated value of the gold output of 1909 was $19,460,000; that of 1908 was $19,292,818. The copper production of 1909 was approximately 4,000,000 lb., valued at about $520,000; that of 1908 was 4,585,362 lb., valued at $602,267. Probably the output of none of the other mineral products, including silver, coal, marble, and gypsum, differed greatly from that of 1908, when the total value was $244,189. From 1880, when mining was first begun in Alaska, to the close of 1909, the total value of the mineral production has been, in round numbers, $168,000,000. Of this amount the gold mines have contributed about $161,000,000; the commercial value of the silver output has been about $1,200,000, and the copper production has been about $4,700,000. The remainder is represented by the value of the output of coal, gypsum, tin, and marble. The placer camps of the Yukon basin were the scene of much mining activity in 1909. Two new dredges were put in operation near Nome, material progress was made in constructing a railway up the Copper River valley, and some work was done on the railway to the Matanuska district. The most significant feature of the year's mining operations was the amount of prospecting and development work done on auriferous lodes in some of the placer districts.

Coalfields.—The coalfields form an important factor in the present situation. If opportunity is given to mine the coal, railway construction over a part of the territory, at least, will be pushed with the utmost vigor. The exploitation of the high-grade coal is of great importance to Alaska, but is probably of still

greater importance to the commercial interests of the Pacific States. It will give a new impetus to manufacturing and transportation interests. By furnishing coke for smelting it will probably make available for local use the iron deposits of the west coast of the United States, and thus lead to the conservation of those of the East, more valuable because nearer the centres of population.

Lode Mining.—Preliminary estimates indicate that the value of the gold produced from lode mines in 1909 was about $3,400,000, or approximately the same as 1908, which was $3,357,335. Of the auriferous lode mines operated in 1909 all but five are in the Juneau district. The Treadwell group continues to be the dominating factor in lode production, but some other large enterprises have either, like the Perseverance, become productive or, like the Ebner and Kensington, will soon be producers. A large pro-

ducer-gas plant is being established near Juneau by the Perseverance company, and the Ebner mine has been taken over by a new company and is to be opened on a large scale. There is promise that the protracted litigation over the Kensington mine and other properties at Berners bay will soon be settled, and extensive developments are expected in this field at an early date.

In this field of essentially low-grade orebodies the possibility of utilizing water-power is receiving increasing attention. The topography of the country is not favorable to natural water storage, though some lakes in the region will furnish power. Water-powers are by no means so abundant as might be inferred from the heavy precipitation, most of which runs off quickly. Moreover, every water-power enterprise must provide for the low water of the winter months. The high relief, heavy timber, and the fiords make the establishment of transmission lines difficult.

One of the most encouraging events of the year was the discovery of promising lode prospects in many of the gold placer districts. Notable among these are the auriferous quartz veins found near Seward on Kenai peninsula, on Willow creek, in the Susitna basin, near Fairbanks, in the Koyukuk and Chandlar valleys, and in the Bonnifield district. Auriferous veins have been found at several places on Kenai peninsula, and the prospecting on some of them during the year has yielded encouraging results. Noteworthy discoveries were made at False creek and near Moose pass, not far from the Alaska Central railway. Some rich auriferous quartz has been found on Willow creek, an eastern tributary of the lower Susitna. Little information is at hand concerning the character of the deposits last mentioned, but there can be no doubt of their high content in free gold. Two small stamp-mills were operated in this district during 1909.

The discovery of auriferous quartz in 1908 in the valley of Chatham creek and in Skoogy gulch was followed in 1909 by similar discoveries at several other localities that apparently lie in the same belt. The country rock of this belt is chiefly quartz-mica and quartzite schist with granitic intrusives. The schists are closely folded and strike, in general, northeast and southwest. The abundant quartz veins are in some places parallel with the schistose structure; in others they cut across the lines of structure. The schist, as well as some of the quartz veins, has been subjected to extensive shattering and local brecciation. The spaces thus formed have been filled with crystalline quartz, ferruginous matter, and other materials, including gold. A study of the schists and igneous intrusives made to determine the origin of the metallic deposits indicates that the metallization was probably caused by the igneous intrusions.

During the summer of 1909 more or less systematic prospecting of quartz veins was carried on at ten or more localities, most of them in a zone about ten miles long, stretching northeastward from Pedro Dome and drained by creeks carrying auriferous gravels. Some of these quartz veins are close to the igneous intrusives, and all are within an area of possible igneous influence. The veins that have been opened range from small stringers less than an inch wide to veins 12 ft. or more thick. The schists of this belt are much jointed and locally faulted, and the veins occur along joint-planes and local fault-planes, and have themselves been in places much broken and faulted. The rich ore that has thus far been found is chiefly in small stringers, or in veins, the largest nearly 3 ft. thick. Valuable deposits are reported to occur at places in the wall-rock as well as in the veins. Though many of the individual stringers pinch out and some of the veins are broken by faulting, others persist for several hundred feet along the strike.

The auriferous quartz is dull white, shows in places comb structure, and much of it contains visible gold in the hand specimens. Some of the associated minerals are iron pyrite, stibnite, sphalerite, and galena. Complex sulphides containing antimony are probably also present. The material has not yet been studied in sufficient detail to establish the character of some of the metalliferous minerals. The specimens collected by the Geological Survey party show no trace of tellurium, though this mineral has been reported by prospectors.

Development has been confined to surface prospecting, sinking on the veins to depths of less than 100 ft., and driving along them to distances not much exceeding 100 ft. The material has been milled in small lots by means of a small stamp-mill established at the town of Fairbanks during the winter of 1909. Although insufficient development work has been done on these veins to determine definitely their importance, some of them are nevertheless of a character to warrant the effort that is being made to develop them and to encourage the search for other lode deposits in this district.

Much lode prospecting has been done during the year in the Bonnifield district, which lies about 40 miles south of Fairbanks. Some promising prospects are said to occur in a belt that follows closely the base of the Alaska range. One very large orebody has been reported on Jerome creek, a tributary of Wood river. This ore, judging from specimens and not from field examination, is made up of an altered rhyolite porphyry, which has been fractured and permeated by secondary quartz with some pyrite. The ore is said to carry gold and some silver. Systematic prospecting of this property is going on with the use of a small stamp-mill.

Considerable quartz prospecting has also been done in the Koyukuk and Chandlar regions. Here the country rock consists of carbonaceous schists and phyllites. Through much of the schist there is a rather uniform dissemination of secondary quartz, but at certain localities the quartz occurs in stringer leads that lie parallel to the schistosity. In still another locality the quartz veins seem to follow fissures which cut the foliation of the schists. In some places the schists are highly mineralized with gold-bearing pyrite. Free gold occurs in quantity in some of the quartz veins.

Copper Mining.—Only seven copper mines were operated in Alaska during 1909, but these produced nearly as much metal as the nine mines operated in 1908. The low price of copper, though the principal cause for the small production, did not greatly deter

activity in prospecting, both in the Ketchikan and Prince William Sound districts.* The Mount Andrew, Jumbo, and It mines shipped ore throughout the year, and work at the Goodro made sufficient progress during the summer to put the mine on a productive basis. In the Prince William Sound region the Bonanza still remains the largest producer. At the Gladhaugh the sinking of a cofferdam to take a large body of ore lying above the first level was begun. Considerable development work was done also on other properties.

The inland copper districts await railway transportation. Only at the Bonanza, in the Chitina district, was there any actual mining. Here an aerial tram was completed in August and brought down some ore, which is ready for shipment as soon as the railway is completed. The probability of early railway connection stimulated prospecting throughout the Chitina valley, and much of this was more systematic than that of the past. As a rule, however, property owners in this field have been inclined to do only the required assessment work and to defer the installation of mining and prospecting plants until transportation charges have been reduced. In the Nabesna region one property has been systematically developed, but elsewhere in the Nabesna-White copper belt little has been done but assessment work.

Bonanza Mine, Prince William Sound.

Placer Mining.—The value of the placer gold produced in 1909 is estimated at $16,000,000; that mined in 1908 was worth $15,888,000. This is a remarkably good showing, for, owing to various causes, there was a falling off of nearly a million dollers in the gold output of Seward Peninsula. This loss, however, was more than made up by the increased production of the Yukon camps, notably Fairbanks, Koyukuk, Innoko, Hot Springs, and Birch Creek.

The installation of two additional dredges near Nome and the successful operation of three others in Seward Peninsula and of three in the Forty Mile district are, perhaps, the most significant facts of the placer mining operations. These dredges and the hydraulic plants operated in the Birch Creek, Hot Springs, Nizina, Porcupine, and other districts in Alaska indicate that, as bonanza mining decreases, progress is steadily being made in equipping plants to exploit the gravels containing less gold. It does not follow that, because there have been many successful ventures with large plants, all the low-grade gravels of Alaska can be profitably exploited. Investors can not be too careful in scrutinizing projects of this kind and in insisting on exhaustive prospecting of the gravel beds and on the study of local conditions before they undertake to install large mining plants.

At Nome, unfortunately, the installation of large plants has not gone on rapidly enough to insure the holding up of production when dry seasons curtail the output of the smaller operators. No one who has studied the mineral resources of Seward Peninsula can doubt that it includes extensive reserves of gold-bearing gravels. With the exception of the dredges and some small hydraulic plants there are but few large mining ventures in this field. Mining has also been retarded in Seward Peninsula by lack of recognition of the comparatively small quantity of water available under head for mining purposes. This condition will have to be met before material advancement can be made in large mining enterprises. The past summer was one of the driest yet recorded in Seward Peninsula and serves to emphasize the need for revolutionizing mining methods that depend for success on the use of water supplied by ditches.

Although there were no new developments in the Fairbanks district other than those in lode prospecting, already referred to, the gold production was larger than in 1908. The increase was due mainly to the output of a few rich claims on Engineer creek. Though the district is prosperous and many claims still contain valuable pay-streaks, it must not be forgotten that on many of the creeks the days of bonanza mining are numbered. Unless means are at once devised for mining the large bodies of auriferous gravels whose content is too low for exploitation by present methods, the output from the placers will soon decrease. Much of this ground is probably too deep for dredging, and its excavation therefore presents a serious problem, worthy of the attention of experienced engineers. If cheap power could be obtained—either direct water power or power generated for pumping by utilizing the extensive lignitic coal deposits of the Bonnifield district—it is possible the heavy overburden of muck might be cheaply removed by water under head, so that the auriferous gravels might be dredged; or they might be elevated by mechanical means, as in the Klondike. The gravels of the upper drainage basins of many of the creeks are not too deep for dredging, and it seems probable that some dredging enterprise may soon be launched.

If the cost of mining could be reduced by establishing railway connection with the coast, many deposits, both in the Fairbanks and adjacent districts, could be profitably exploited by methods now in use. The present system of water transportation is expensive and—what is perhaps more important to the mining interests—particularly uncertain. Unless some change is made, however, placer mining will,

*The district is reviewed in detail in another column by U. S. Grant.

within a few years, be confined to a small number of large enterprises, as it now is at Dawson.

During 1909 mining was continued on all the creeks that were productive in 1908. There was special activity along the lower courses of Cleary, Vault, and Dome creeks, and as a result a large amount of gold was taken out of the Chatanika flats. So far as known, Goldstream and its tributaries made the largest production, Dome creek standing second.

Of the districts adjacent to Fairbanks, Hot Springs and Birch Creek were most prosperous, but mining was also done in the Rampart, Tenderfoot, and Salchaket regions. In the Hot Springs and Birch Creek districts several large plants were operated during most of the season. In addition to the smaller mining enterprises three dredges were in operation in the Forty Mile basin in 1909. One of these is on the south fork of Forty Mile and two are on Walkers Fork. It is significant that dredges are successfully operated in this district—one of the most isolated placer districts in Alaska. The initial cost of these plants is probably double what it would be in some of the other districts, and, moreover, for two of these dredges the ground has to be thawed.

The Koyukuk district, which has been growing in importance as a gold producer, has been developed practically without the aid of outside capital. The productive placers of this district fall into three groups, which appear to mark three auriferous belts and include (1) those of Myrtle, Marion, Missouri, and Gold creeks; (2) those of Vermont, Nolan, and Emma creeks; and (3) those of Mascot creek. Up to 1907, when the deep placers of Nolan creek were discovered, mining was confined to shallow deposits. In 1909 probably 90% of the gold was taken from the deep gravels of Nolan creek. The Koyukuk district is difficult of access and mining costs are high, but in spite of the adverse conditions the value of its gold output in 1909 was more than half a million.

In 1909 the Innoko district produced gold to the value of probably $300,000. This indicates that systematic mining has begun. In mid-summer placer gold was found on Otter creek, which flows into the Haiditarod, a northeastern tributary of the Innoko. Sufficient prospecting appears to have been done to indicate the presence of a pay-streak 50 to 70 ft. wide, in which the gold is rather uniformly distributed. It is reported that this pay-streak carried gold worth 7 to 10c. per pan. The alluvium is said to be frozen and to be about 12 ft. deep. The information at hand indicates that these placers lie in what would be an extension of the Innoko auriferous zone. So far as prospected the gold seems to be more uniformly distributed than in the Innoko gravels. The above information appears to form the basis for the stampede to the Haiditarod which took place from Fairbanks and other points in Alaska late in the summer.

Although the placer-gold output of the Yukon and Seward Peninsula placers overshadows that of all the smaller districts, yet in 1909 these made an aggregate production of half a million dollars. Their wide distribution—from southeastern Alaska to the Kobuk river, north of the Arctic Circle—is a measure of the extent of the auriferous mineralization in the Territory.

REVISED ATOMIC WEIGHTS.

Written for the MINING AND SCIENTIFIC PRESS
By F. H. MASON.

On November 17, at London, the International Committee on Atomic Weights issued its report for 1909. The committee has taken under consideration researches on the atomic weights of chlorine, nitrogen, carbon, iodine, silver, phosphorus, arsenic, chromium, tellurium, mercury, palladium, krypton, and xenon, and they recommend that changes be made only in the atomic weights of arsenic, chromium, krypton, and xenon. The following are the researches upon which the advised changes are made:

Arsenic.—The ratios between arsenate of silver, Ag_3AsO_4, and bromide and chloride of silver, were determined by Baxter and Coffin (*Jour.* Amer. Chem. Soc., 1909, 31, 297) by two methods; first, in the usual way, by solution and precipitation; and second, by heating the arsenate in a stream of HCl or HBr. From these researches, the figure 74.957, when silver equals 107.88, was obtained as the atomic weight of arsenic.

Chromium.—From analyses of silver chromate by two methods Baxter, Mueller, and Hines (*Jour.* Amer. Chem. Soc., 1909, 31, 529) obtained the figure 52.008, while Baxter and Jesse, from similar analyses of silver dichromate got the figure 52.013 as the atomic weight of chromium. (*Jour.* Chem. Soc., 1909, 31, 541.)

Krypton and Xenon.—Moore isolated large quantities of krypton and xenon from the residue of 120 tons of liquid air (*Trans.* Chem. Soc., 1908, 93, 2181), and, by determining the density of gases, arrived at the figures 83.012 for krypton and 130.70 for xenon.

The new figures, then, adopted by the committee are: Arsenic 74.96, chromium 52.00, krypton 83.00, xenon 130.70. In the case of chromium and krypton it will be noticed that the committee has rounded off one hundredth for the sake of obtaining whole numbers.

Researches by Easley, that have not yet been published but were communicated privately to the committee, place the atomic weight of mercury at 200.62. As Easley, however, is still continuing the research, it was decided to let this element remain at the old figure, 200.00, for the present. The wisdom of retaining the old figure, 35.46, for chlorine, instead of 35.468, as suggested by the research of Guye and Fluss (*Jour.* Chem. Phys., 1908, 6, 732), is confirmed by the recent researches of Gray and Burt (*Jour.* Chem. Soc., Oct. 1909), which were concluded too late to come under the investigation of the committee.

From the viewpoint of the metallurgist and the mine analyst, the most important change is that of the metal chromium from 52.10 to 52.00. This changes the factor for reducing Cr_2O_3 to Cr from 0.68421 to 0.684625, and other factors proportionately. Should the further researches of Easley confirm the higher figure for the atomic weight of mercury, and the committee intimates that it is likely such will be the case, it will make a considerable difference in the determination in cases where the element is not weighed as metal.

THE BOICZA GOLD MINES IN HUNGARY.

Written for the Mining and Scientific Press
By Newton B. Knox.

English engineers have a saying that some time there comes to every engineer a call to inspect a Hungarian gold mine. Recently my opportunity came and these notes and impressions are based on a flying visit to that delightful and interesting country. Gold is found in Hungary in three districts: Schemnitz, Kremnitz, and Transylvania. The first two are of little importance, while Transylvania in east Hungary, and adjoining the Galician border, is the chief gold producing region of all Europe.

The gold deposits of Transylvania lie within the boundaries of a well defined quadrangle as will be seen by the accompanying map. It will be noted that Boicza lies midway between the districts of Brad on its north and Nagyag on the south. In the Brad district is situated the well known Twelve Apostles group, consisting of the mines of Ruda, Barza, Muszari, Valea Mori, and Valea Arzulin—the whole famous as the largest gold producer on the Continent. It is German owned and German managed, equipped with a 200-stamp mill and employs 3000 men per day. The records of the past two years claim a profit of $350,000 to $500,000 annually. Up to 1904, according to Malcolm Maclaren, this property has produced 450,243 oz. crude gold derived from 1,410,209 metric tons of ore (6.3 dwt. per ton), and the total value of its output to date is about 6¼ million dollars. In 1904, 163,000 metric tons were treated at a total cost of $5 per ton. The management boasts to be able today to treat, at a profit, ore carrying 2 dwt. per ton. In 1902 out of a total yield of all Hungary of 2¼ million dollars 30% was produced by the Twelve Apostles mine. South of Boicza lie the old mines of Nagyag, now owned and operated by the State, and at present awaiting the completion of a 60-stamp mill. The gold here occurs chiefly in the telluride form known as nagyagite. At Boicza the following eight separate mines lying near to and adjoining the village of that name, have been formed into a group under one ownership: Boicza, Troicza, Kajanel, Tresztia, Herczeyany, Barbura, Csertes, and Magnra. Of these the first four are the most important. The Boicza district is locally known as Siebenburger (seven municipalities).

The Transylvania mines are very old. They have been worked for generations, indeed I know of no other gold district whose mines have suffered less from inactivity during a long life. It is true, other ancient mines exist, in the Far and Near East, in parts of Africa, mines whose birth occurred even earlier than Siebenburger; yet all these died comparatively young, whereas Boicza and her neighbors have continued mining almost unbrokenly throughout the centuries. Hungary has been the dark and bloody ground of Europe and with each succeeding conquest her mines have changed hands to be worked by their new owners. Thus the history of the mines is intermingled with that of the country and every conqueror has left his mark on each. The history of Siebenburger antedates the Roman occupation, for in Homer we read "on Maris the Ayathyas sat and dug for gold." The Dakers, a sturdy people, next settled here and they too, "sat" and dug for gold. Their king, the warlike Dekebalus, successfully opposed the Roman legions till finally overthrown by Emperor Trajan who, invading the country from two sides, seized the capital, Sarmizegthusa. Legend has it that the mighty treasures of the Dakin king were hastily buried in these mountains and only last century a stock company was formed for their exploitation. In 106 A. D. Dakin became a Roman province and was named by them

Village of Bolcza, Hungary.

'Auraria' (gold country). After 170 years of peaceful Roman occupation and ownership came the wild Germanic tribes, followed later by other barbaric hordes. Then came the Hungarian kings; and after them the Turks, who in turn were conquered by the Crusaders. Coming down to later times we read in old documents, that in 1444, King Albert granted to one George Brankovits the mines of Boicza, then named Kisbanya (little mine). The various mines have been at times State-owned or subsidized by the State. Trestia was once owned by the family of Count Gyulayana, Barbura, by Count Kalnoki. All have been worked by companies of either local or German holding, and the management has usually been German. These companies ran their long adits, put up their mills and wire-rope ways, stoped their ore, and—failed. Various reasons have been assigned for their failures, extravagant and incompetent management and ill-advised metallurgical treatment, being the usual ones. Finally, the mines have been acquired by an enterprising Rumanian, who is working them at a profit of about $60,000 annually.

Map of Gold Districts of Transylvania, Hungary.

Topographically the district is not unlike the Mother Lode region of California, only here in Hungary the red adobe soil and grave-yard slates are lacking. Boicza is situated 23 kilometres north of the railroad town of Deva, and 15 km. north of the river Maros. It lies on the slopes of Soredill, a mountain 687 metres above sea-level. The climate is good; warm in summer and bracing in autumn and winter. About two to three feet of snow falls. The region is given over to plum growing. From the plums is made a brandy or sehnaps famous throughout Hungary. This is called Sligovitz, and 2000 litres were produced last year. The workmen of the district are mostly Rumanians with some Germans and Hungarians, and a few Gypsies. Thus Boicza town contained in 1899, 1100 Rumanians, 500 Germans, and 200 Hungarians. As a cheap laborer the peasant here is excellent. He is a good workman, industrious, willing, and his politeness is carried to a degree that strikes an American as positively cringing. He has his neat little thatched cottage, his patch of cultivated ground, and seems on the whole prosperous and contented. In this land of surprises the dress of the peasant is not the least surprising. Here the women wear on all occasions heavy cowhide knee boots, and here too their husbands are clad, on fete days, in white trousers (pants would be the proper word) edged with beautiful flowing ruffles which causes them to appear to the eyes of an embarrassed stranger to be wearing part of their wives' wardrobe. In the attached photograph the ladylike appearance of these gentlemen will be noted. While on the subject of dress it would be an oversight not to refer to the glorious opera-bouffé uniform of the Saxon mine foreman worn throughout the continent. This uniform is of black cloth trimmed with gilt buttons, is embroidered all over with gold stars and golden cross hammers. Add to this the epaulet of gold fringe, and you have the German mine foreman in his 'habit as he lived'. Solomon in all his glory * * * *. The only reason he does not wear a sword like the Berlin postman is because the idea has not occurred to him. Fancy falling down a winze while dressed like this! The miner is superstitious to a fault, is given too many holiday fetés, and gets gloriously and shamelessly drunk to celebrate the slightest event. Usually the foreman and superintendent are German. They have no labor unions.

The Soredill peak and range are composed of a complex of melaphyre and quartz-porphyry (dacite) superposed by dark blue Jurassic limestone. This limestone, outcropping boldly as it does on the peaks above town, forms a distinct feature of the landscape. Economically, however, it is of little importance as no orebodies lie within it. The melaphyre with its bodies of intruded dacite show evidences of great shattering and fissuring. Both rocks have undergone extensive weathering and kaolinization, especially in the neighborhood of orebodies. The latter usually occur in the dacite. The ore in the district occurs as (1) 'gauch' veins; (2) stockwerk; (3) normal fissure veins; (4) a combined fissure and stockwerk.

1. The gauch vein is the most characteristic of the region, and is best seen in the Troicza mine. Its vein filling is composed of angular quartz-porphyry fragments either cemented together by secondary jaspery quartz, or more often lying embedded in clay. These angular fragments have every appearance of fault-breccia, though the walls from which

they were derived, have subsequently undergone such alteration and prophylitization that the veins now blend gradually into the unaltered dacite. The gold-bearing solutions came in with the cementing

Villagers at Open-Air Ball.

materials. At times the breccia forms a sheathing, sometimes 60 ft. wide, on each side of the vein; being itself either low grade or barren, and the ore a narrow streak sandwiched in the centre. The gauch veins (that is, the ore) vary in width from a stringer to several metres. The walls are irregular and poorly defined. Consequently the orebody is apt to suddenly pinch or swell. In depth, these veins tend to give up their gauch characteristics and become ordinary fissure veins with cleaner cut walls and a clay gouge.

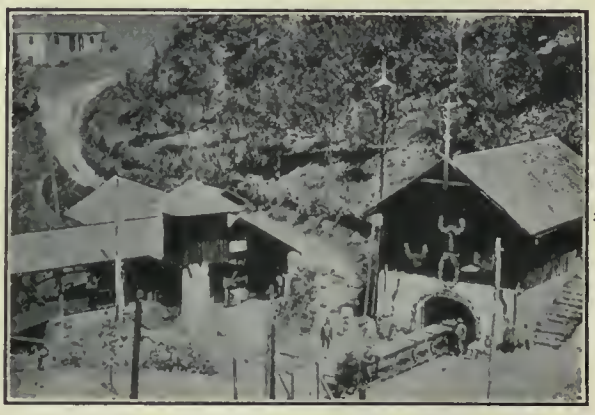
2. Stockwerk occurs occasionally but does not here play as important a rôle as at the Twelve Apostles and Czebe where most of the gold is won from this type of deposit. In the south end of the Boieza mine several roughly parallel fissures approach, and

Mouth of Boicza Adit.

near their union is a shattered mass of quartz-porphyry crossed in every direction by stringers and veinlets of quartz—the whole forming a typical stockwerk and known locally as 'the stock.' This mass has been stoped to a depth of about 300 metres and forms a neck 20 to 30 metres in diameter, the whole running about $5 per ton. Occasionally one of the main veins cuts through the stock without losing its identity as a vein or its ore content. Often masses of free gold are found within the stock.

3. Normal fissure veins are best seen in the Boicza. There they occur in unaltered or slightly altered dacite, possess regular well defined walls, and average about 2 ft. in width. Much free gold is found in this type of vein, and its occurrence forms incentive to prospecting by tributors. In some veins stringers and veinlets of heavy sulphide ore have enriched the country adjacent to both walls. In the old stopes such stringers have been left behind either purposely or overlooked. Blasting down would enhance materially the value of the stope-filling when the time comes for its extraction.

The gold occurs in masses of free gold, not unlike the rich pockets of Tuolumne,



Tunnel Buildings.

Mariposa, and Trinity counties, California. More usually it occurs associated with telluride gold, pyrite, marcasite, zinc blende, galena, and sometimes small amounts of chalcopyrite. The fineness of the gold is 600 to 700. The ore as a rule carries no minerals which would interfere with successful cyanidation. Ore-shoots appear from old stoping maps to be persistent in both strike and depth, the shoots showing a remarkable continuity. However, as the old miners often mined unpayable ore, not too much reliance can be placed upon evidence of the kind. From sampling results, the shoots appear to be 100 to 400 ft. long, measured along the drift, and the veins from 4 in. to 3 ft. wide. The value averages from $4 to $12 per long ton. How these shoots behave above or below the drifts I am not prepared to say, but they have every appearance of strength.

What stands out the sharpest in the memory of a visiting engineer is the appalling amount of development done on the eight mines. Boicza itself has no

less than 22 miles of adits, drifts, and cross-cuts. With this as a measure one would not be far wrong to estimate the total amount of workings in the group at 100 miles. Of course, all workings are not at present open, yet as a whole, they are in a surprisingly good state of preservation, especially the main drifts. Each mine has its long lower main adit. These in many cases connect. The Boicza cross-cut is over 1700 metres long. The Kajanel and Herezegany is 2200 metres (1½ miles), the Grinn tunnel, at Troicza which connects with the Barbura mine workings is 4500 metres (13 miles). Almost without exception the adits have been driven at the expense of the State and one cannot help feeling that in some cases at least the object of driving has been, not so much as a means of development or transportation, as to give employment to the people. This idea is strengthened by the unduly large cross-section of most of the tunnels. The lowest practical level of exploration by means of adits has been reached. Shafts must be used in the future, and indeed Boicza has at present a shaft extending 810 ft. below its adit. Transportation is carried out in the Boicza adit by means of an electric haulage system; 350 volts, 40 amperes, 6 hp. (overhead type) locomotion and ton trucks on a 580-mm. gauge. The other adits employ horses. Dry rubble stone work laid in elliptical cross-section is used in the main adits instead of timber. It stands well and is found to be cheaper. In a level 2.2 metres high by 1.4 metres wide, it cost $4 per running metre—contractor finding everything. The raises and ore-chutes are also all dry stonework and cost, under same conditions, 75c. per metre in height. The mining practice has no unusual feature. The stopes are filled from the wall directly the ore is removed. This also is done by contract and cost 60c. per running metre. This price includes both the stoping and filling. The Rumanian timberman as yet does not understand the use of wooden wedges in mining. He cuts with infinite patience a neat and finished hitch in each wall, wherein he inserts, usually horizontally, his timber. As a result a visit through old open stopes is not without its dangers.

A curious feature of Boicza is the tunnel-house commonly built over the mouth of each working adit. This is usually a large wooden building, two stories high with the continuation of the tunnel passing through the lower floor. The tunnel mouth is closed by an iron grating or grill, locked, and in charge of the gate keeper. No miner passes through this gate. He must on entering ascend to the second story where his number is taken by the time keeper. He changes his clothes in the change-room here, and then kneels before an altar with its crucified Christ and prays for a safe deliverance from the mine. He then passes down the back stairs directly into the tunnel. On returning, this procedure is reversed: the miner is searched for free gold and he now gives thanks before the mine altar for his safe return.

The remains of the Roman workings are most interesting. So well did the Roman miner labor when he "sat and dug for gold" that his workings have been utilized today wherever they have been found. The Roman miner working, as he did, without powder, left a beautifully smooth and finished drift behind him. It is of the most unusual size, being roughly 7 ft. high and 2 ft. wide at top and about 5 ft. wide at the bottom. The Roman workings in Kent, England, were all driven by tools of tempered copper or bronze as proved by the particles of this metal still remaining in the tool cuts. Here in Hungary, on the other hand, the Roman miner used iron or steel. The small niches cut in the wall wherein he placed his little bronze or clay lamp are still visible. In 1880 there was found in the neighborhood of the Rudolfi tunnel a collection of Roman coins dating from an epoch between Julius Augustus and Marcus Aurelius. Bowls of limestone for grinding ore have been found, and also a Roman miner's bronze lamp bearing the inscription 'Murri'. These relics are all to be seen in the museum at Deva.

The only mill now remaining is one of 50 stamps built by Frazer & Chalmers, and this is in a poor condition. The metallurgical process is bad. No attempts are made to save the concentrate, and it is doubtful if 50% is recovered by the present method. In the mill stand unused about a half dozen queer looking German vanners of a happily obsolete pattern, each about 15 ft. long and 3 wide, combining a traveling belt movement with a bump-table effect. Here also are the spitzsch and spitzlutten, so dear to the heart of the German mill-man. Power is steam-generated by wood fuel: the latter costing only 50 to 60c. per cubic metre.

The total cost per ton excluding taxes, insurance, and office expense, is given at $3.20. Most work is carried on by contract, the contractor finding everything except power and the mine sharpening and repairing tools. The following are a few of the costs:

Driving in soft ground, 2.20 by 1.40 m., per metre forward	$3.80 to $5.00
Driving in wet ground, 2.20 by 1.40 m., per metre forward	5.00 to 10.00
Sinking in dry ground, any size, per metre deep	18.00 to 20.00
Sinking in wet ground, any size, per metre deep	20.00 to 40.00
Shaft timbering, per metre deep, company finding timber only	4.00
Stoping 2 m. high by 1 m. wide, per metre forward	1.20 to 3.20
Timbering in drifts, with lagging, per metre forward	1.20
Dry stone work for raises, chutes, etc., hole 0.8 m. diam., 1 m. high	0.75
Track laying (new) per metre	0.05
Track laying (old) per metre	0.02½
Tramming by contract, any distance per truck	0.02½
Stope filling, per metre forward	0.65
Day laborers, smiths, carpenters, engine men, per shift 10 to 12 hours	0.28 to 0.80

The contractor does the tramming to the nearest delivery spot and finds all blasting material, lights, tools, and incidentals. Each miner on day's wages stopes, blasts, and delivers in chutes one ton of ore per shift.

Notwithstanding its former failures and its present poor mill-recovery, the Boicza mines are not without hope. In spite of its 100 miles of development, there still exist large areas of unexplored ground which hold out every encouragment for prospecting.

METALLURGICAL PROGRESS IN COLORADO.

Written for the Mining and Scientific Press
By Philip Henry Argall.

In reviewing the metallurgical processes in operation in Colorado at the close of the year 1909, the changes prominently brought to notice are: (1) the decline of the smelting industry, due to the scarcity of high-grade ore; (2) the decadence of the chlorination process as a factor in the treatment of Cripple Creek ore: (3) the rejuvenation of the cyanide process. The important metallurgical success of the year has been Stratton's Independence mill, which has fairly solved the problem of treating the lowest grade Cripple Creek ores at a profit. In the other direction changed conditions are shown by the closing down and dismantling of the Argo plant of the Boston & Colorado Smelting Co., a plant which has been in successful operation since 1873.

Victor, Colorado, Cripple Creek District.

Cripple Creek.—This has been a quiet year in the metallurgy of Cripple Creek ores. The great mills of the valley plants treat 80% of the ores produced in the district, about one-half by chlorination in the plants of the United States Reduction & Refining Co., and the Portland Gold Mining Co., and the other half by cyanidation at the Golden Cycle plant: All of these plants are situated in or near Colorado City. The small cyanide mills of the district, excepting that on the Isabella property, remained closed during the greater part of the year. These mills, being designed for the treatment of oxidized ores by direct cyanidation, are unable to handle the sulpho-telluride ores which now form the bulk of the production. Thoroughly oxidized ores are practically no longer mined, therefore, good extraction from the mixed oxidized ores and sulphide ores now being produced cannot be expected and a dismal future for the dry-crushing non-roasting mills in the district is foreshadowed. The Wishbone mill has been overhauled, and an Australian roaster installed. This is said to be now in successful operation on ores from the Midget mine which contains less than $10 per ton. Since this mill began operation the rate on ores, including freight and treatment charges, has been reduced to $4 per ton where the gold content is under $10. With coal at $5 to $6 per ton, labor at $3, and all supplies carrying an enormous freight charge, it is evident that roasting plants in the district cannot begin to compete with the valley mills on ores below ½ oz. per ton, particularly plants handling less than 300 tons per day. The following are the open rates on which ores are purchased by the valley mills, including railroad freight from mine to mill, based on paying $20 per ounce for gold content.

Oz. gold.	Per ton.
Up to ½	$4.00
½ to ¾	5.25
¾ to 1	6.00
1 to 1¼	6.50
1¼ to 1½	7.00
1½ to 2	7.50
2 to 3	8.50
3 to 5	8.75

With a freight rate of $1 per ton on ½-oz. ore, the mills receive but $3 per ton for treatment. This is, no doubt, close to the actual cost. The railroad rate is based upon the Vanderbilt maxim 'all the traffic will bear', and amounts to one-fourth the value of $4 ore for less than a 35-mile down-hill haul from mine to mill. The mills continue the scaled rate, at best not more than covering expenses on the lowest grade, but thereby stand to take good profit on the

higher grades. Cripple Creek, like all great camps, continues to produce a large tonnage of increasingly lower-grade ore, consequently the great need is for some method that will give a profit from the treatment of sulpho-telluride ore worth $3 to $5 per ton. The high-grade ore has always gone to the smelter, perhaps 90% of the ore exceeding 4 oz. per ton having been smelted.

In the neighborhood of 40,000 tons per month has been shipped out of the district in 1909. The treatment of this ore is distributed as follows: 50% by cyanidation, 40% by combined chlorination and cyanidation, 10% by smelting. All the ore treated in the district is cyanided, and, if included, would bring the average monthly tonnage up to 50,000, with the treatment distribution about as follows: 60% by cyanidation, 32% by combined chlorination and cyanidation, 8% by smelting. This shows clearly the marked advance in cyanidation.

There is a strong rumor that the mill of the Portland Gold Mining Co., which now handles over half of the ore treated by chlorination, will in the near future be changed to the cyanide process, leaving—providing no other changes are made—but one chlorination mill in operation as against five a few years ago. Taking those mills only which passed the adolescent stage in treating Cripple Creek ores, their history may be summed up as follows:

Mill	Capacity in tons per day	Process	Remarks .....
Lawrence	100	Chlorination	Destroyed by fire.
Gillett	100	Chlorination	Destroyed by fire.
Economic	300	Chlorination	Destroyed by fire.
El Paso	150	Chlorination	Destroyed by fire.
National	100	Chlorination	Dismantled.
Philadelphia	250	Chlorination	Obsolete and inoperative.
Union	300	Chlorination	In suspended animation.
Standard	400	Chlorination	At about 75% capacity.
Portland	300	Chlorination	At about 80% capacity.
Golden Cycle	700	Roast-cyanide	About capacity.
Metallic	350	Roast-cyanide	Dismantled.
Dorcas	100	Roast-cyanide	Burned.
Brodie	120	Roast-cyanide	Burned.
Isabella	100	Straight cyanide	Running at capacity.
Wild Horse	100	Straight cyanide	Inoperative.
Anaconda	100	Straight cyanide	Inoperative.
Independence	170	Cyanide-concentration	About capacity and being enlarged.

The Golden Cycle mill began operation as a leaching plant using bromine solution—Cassel patent—and was later changed to a barrel plant, still using bromine. Still later it was again changed, this time to a barrel chlorination plant, and about a couple of years ago, after being sold to the Golden Cycle Mining Co., was enlarged and re-built as a roasting and cyaniding plant. The National began as a barrel bromination plant, under Engelhardt's patents, and was later changed to a barrel chlorination plant. It operated for a time, but after its sale to the United States Reduction & Refining Co., was dismantled.

The battle between the chlorination and cyanidation processes in the treatment of Cripple Creek ores in the larger mills is interesting. In the early days, treating oxidized ores, the cyanide process was but slowly introduced and was not particularly successful. With the introduction of the roasting-cyanidation process over half the mill ores were at one time treated by that process. When the largest of the cyanide mills, the Metallic, passed into the hands of the United States Reduction & Refining Co., it was dismantled and later was destroyed by fire, leaving the Dorcas the only mill of this class in operation. The Dorcas mill burned some four years ago, and left a clear field for chlorination. Two years ago the Golden Cycle mill revived the roast-cyanide process on a large scale. The chlorination mills having previously begun the cyaniding of all the tailing from the barrels, cyanidation once more came to the front. In the opinion of some metallurgists this process will ultimately drive from the field the chlorination process in the treatment of Cripple Creek sulpho-telluride ores.

The Portland Gold Mining Co. is now erecting a new mill at the mine, which is to use some modification of the cyanide process not yet made public. Judging from an article in the technical press, it involves some modification by the use of halogen cyanides. This is evidently an attempt to develop a non-roasting cyanide process which will enable Cripple Creek operators to erect mills at the mines and treat profitably low-grade ores incapable of standing the minimum railroad rate of 3c. per ton-mile. The so-called non-roasting process on Cripple Creek sulpho-telluride ores would not succeed, inasmuch as the ores are particularly rebellious, but for the fact that the sulpho-tellurides can be in the greater part removed by careful concentration, after which cyanide—especially when aided by the halogen cyanides—becomes effective.

Probably the most important event of the year in Cripple Creek metallurgy, though little noticed, was the starting and successful operation of the Stratton's Independence mill. This plant is hauling sulpho-telluride ores running from $3 to $4 per ton in gold, and is pointing the way toward the successful treatment of hitherto worthless material, of which immense quantities exist in the mines and on the dumps throughout the district. While not fully meeting the conditions of the long-sought non-roasting process, it does reduce the amount of roasting necessary, 95% as compared with the other processes in use. The mill, with a capacity of 5000 tons per month, has been running steadily since April on the ore-house dump that showed an average sample value of $3.60 per ton. The whole process may be said to depend on a most careful concentration to remove as completely as possible the sulpho-tellurides, followed by cyanidation of the tailing. The following is a brief description. The dump rock is loaded by means of a power shovel, is coarse-crushed in gyratory crushers and rolls, followed by fine crushing in Chilean mills, using cyanide solution instead of water for both crushing and concentrating. The sand is separated from the slime and both are cyanided. The total cost of this process was estimated by the consulting engineer at $1.50 per ton and so published by the company. The mill is now be-

ing enlarged 50% by the addition of a third Chilean mill and the necessary tables. This will lower the treatment charge to something near $1 per ton, as against the present lowest treatment charge of $4 on similar ores at the custom mills. A method of ore treatment that reduces costs from 300 to 400% is slightly revolutionary! This process, however, differs from all of the 'epoch-making processes' in one essential—there are absolutely no secret or patented methods in use. The whole process, or combination of processes, consists simply in adaptation of well known apparatus and methods to obtain the desired end.

Leadville.—No metallurgical improvements of note have been introduced into the ore treatment practice of this camp during the current year. As is well known, the bulk of the ores are of smelting grade, the majority of them being treated at the local plant of the American Smelting & Refining Co., the Arkansas Valley. This has one of the newest and best of the Huntington-Heberlein roasting plants and eight modern blast-furnaces, with a capacity of 1000 tons per day. For various causes, some of which will be noted, the plant has not been operated at full capacity, and has at present, but four of its eight furnaces in blast. The Arkansas Valley, is, perhaps, the best equipped smelter in Colorado, having been almost entirely re-built within the last few years, and being equipped throughout with electrical appliances. The low price of silver and of lead during the greater part of the year has resulted in almost entire suspension of mining in what is known as the 'down town' mines, while the incomplete exhaustion of the silver-lead sulphides in the other properties has caused more attention to be turned to mining and milling of the zinc sulphides. There has been consequently a falling off in the development and milling of the smelting grades formerly the sole product of Leadville. The mixed sulphides mined in this camp contain a large quantity of iron pyrite, usually of a very low silver content. The elimination of this, in order to raise the percentage of the zinc, has received the attention of several metallurgists, and has resulted in quite a collection of mills for the treatment of zinc ores.

One of the earlier and most elaborate of the zinc mills is known as the Rowe, and is situated in California gulch, near the mouth of the Yak tunnel. At first this mill was designed for crushing the raw sulphides 'dry' in ball-mills, and then separating the zinc by means of the International magnetic separator. After a short experience with the ball-mills, rolls were substituted and later a new addition was made to the mill for the purpose of roasting the ores to render the pyrite magnetic. During the past year the separation of zinc from the unroasted ores in the International machines has been abandoned; all the ores treated by the plant being roasted in White-Howell furnaces and the cooled product passed through Cleveland-Knowles magnetic separators. The latest change in the process was in the treatment of the zinc product from the separators by wet concentration, the process now being: (1) roasting the sulphides to render the pyrite magnetic; (2) separating the magnetic product by Cleveland-Knowles machines; (3) wet concentrating the non-magnetic product to obtain, first, a galena smelting product, second, zinc sulphide, third, the elimination of silica. This is the largest zinc mill in the district and has a nominal capacity of 300 tons per day. It has been

A. Y. and Minnie Mines, Leadville.

in steady operation throughout the year, but since the company is a close corporation, little can be learned regarding the commercial results attained.

The Cloud City Milling Co.'s mill, erected on the site of the old Harrison smelter about three years ago, but not operated on a commercial basis, was started up again in August. This mill, consisting of a Wilfley roaster, Wetherill separators, and a wet-concentrating plant, is now treating the complex sulphides of the International Mining Co., of Robinson. The process is as follows: (1) crushing by breakers and rolls, followed by drying; (2) roasting in Wilfley roaster; (3) separation by Wetherill magnetic machines, and iron removed; (4) wet concentration, giving two products—galena and zinc sulphide. The plant is now treating 25 tons per day.

The Leadville District mill, situated near the Arkansas Valley smelter, has worked intermittently during the year on the Ibex dumps, concentrating the sulphides which carry gold. It is a wet-concentration mill of 75 tons capacity, using jigs and tables.

The earlier wet-concentration mills erected in Leadville for the separation of the mixed sulphides, were not notable successes, though some of them worked profitably for a time on ores containing considerable galena, producing a marketable lead ore and a mixed iron-zinc sulphide containing some galena and gangue that went into the dumps of the A. Y. and Minnie, Col. Sellers, and other mines. This product accumulated and remained unused for some 15 years. Within the last year or so it has been shipped to the Empire Zinc Co. at Canon City, and to the United States Zinc Co. at Pueblo, chiefly for the zinc content. The concentrators at these mines have not been operated for some time. The Iron Silver Mining Co., one of the largest in the district, several years ago erected a large wet concentrating plant, which, proving unsatisfactory, was dismantled and sold. The production from the numerous mines of this company is now entirely hand-sorted, the best grades of zinc being shipped direct to the spelter manufacturers, the lowest grades sold to the zinc mills, and the mixed zinc and lead sulphides to the manufacturers of zinc oxide paint. The large mill erected on the Resurrection property, consisting of a wet concentrator followed by Wetherill magnetic separators, has not been operated for some years, and the Wolftone wet concentrator has been closed during the past year, the mine output being hand sorted following the practice of the Iron Silver company. The present treatment of the Leadville mixed sulphides follows the lines of (1) hand sorting to separate the shipping from the milling grades; (2) crushing and roasting the mill ores for a magnetic iron product; (3) separation of the magnetic iron, followed in some cases by wet concentrations to produce a lead product for the smelters, and a silica-free zinc for the spelter manufacturers. This general treatment will undoubtedly be followed in the future for all ores excepting those containing much waste rock. For the latter wet concentration should be a first step.

Salida.—Improvements in the plant of the Ohio & Colorado Smelting & Refining Co. include the installation of the Dwight & Lloyd continuous feed and discharge sintering machines, with a capacity of 30 tons per day. These have proved highly satisfactory. It is claimed that this is the only Dwight & Lloyd plant in successful operation on lead ores. The air blast in these machines is created by a suction fan which pulls the air down through the charge, and considerable difficulty was encountered at first because of the clogging of the fan and the breaking of grates. This has been overcome and the plant is working steadily. It contains four blast-furnaces of the usual water-jacketed type, two of which are now in operation handling about 9000 tons per month. In 1909 a new coarse-crushing plant with belt-conveyors and a Vezin automatic sampler has been installed, as well as new ore-bins and bedding floors. The ore-supply is from Leadville and the San Juan region, with some from the Coeur d'Alene district.

Pueblo.—Of the three lead-smelting plants taken over by the American Smelting & Refining Co. at Pueblo, but one, the Pueblo, remains in blast. The Philadelphia, formerly the property of the Guggenheims, has long since been dismantled, while the Eilers plant is now being torn down. The steel plant of the Colorado Fuel & Iron Co. and the zinc smelter of the United States Zinc Co. are the only other metallurgical establishments here.

At the Pueblo plant five blast-furnaces are in operation at the present time, the base bullion being sent to the Omaha plant for refining. The ore supply is distributed about as follows:

Lead ore, 50% from Idaho, 25% from Leadville.
Quartz ore.....from Creede.
Porphyritic ore.....from Cripple Creek.
Oxidized iron ores.....from Leadville.
Pyritic ores.....from Ouray in small amount.

The most noteworthy feature of this smelter plant is the Huntington-Heberlein installation, which comprises 34 pots each of 8½ tons capacity per charge. The preliminary roasting for these pots is done partly in Godfrey mechanical roasters and partly in hand roasters. The incompletely roasted product is used to fill the pots about one-quarter full and serves as a means of starting the fire in the pot charge. The pot is then filled with the regular charge consisting of one-third fairly coarse quartz ore, one-third lead slime, and one-third pyritic ore. A blast of about 15 ounces is turned on and the roasting completed in about 4 hours. The pots are set in circular brick-work, so that the air in passing up through the charge is drawn over the rim of the pot and passes down through the space between the pot and the brick-work and out to a flue at the side. In this plant no fume is noticeable in the converter building. An electric crane is used to handle the hood and to lift the pot out and dump the sintered charge. In charging, the pot is lowered into a pit in the floor, the roasted ore is dumped in from wheelbarrows, and the balance of the charge is dumped on top of the roasted ore from a stock-bin at the side of the pit. The crane then raises the pot and places it in position in its brick-lined holder, the hood is lifted into place, and the blast turned on. The entire operation requires but 15 minutes. A heavy iron weight, hoisted by the crane and allowed to drop on the fused mass, is used in the preliminary

breaking after which all the material is passed through a crusher and sent to the stock-bins. Fifty per cent of the entire tonnage treated at this plant passes through the pots.

The zinc plant of the United States Zinc Co. was started in 1903 with the co-operation of the company operating a zinc works at Overpelt in Belgium, and was designed to treat the zinc-lead concentrates of Leadville and Creede. These contain 20 to 40% zinc, 15 to 20 iron, and from 7 to 8 lead. Recently some very good concentrate having a uniform zinc content of 27% has been coming from New Mexico. The first operation, after sampling, is the magnetic roast. This is performed in a tubular mechanical roaster, after which the roasted material is water-cooled and sent to the concentrator. The iron is now removed from the ore by magnetic separators, and the zinc-lead residue passes over Wilfley tables where the lead is taken out by concentration. The residue from the Wilfleys, containing about 40% zinc, is sent to the roasters, part being treated in four hand Rhenania roasters, and part in a Matthiessen-Hegeler mechanical roaster of 40 tons capacity. The hand-roasters will handle about 8 tons each per day. After roasting the ore is sent to the bedding floor where it is mixed with coal in the proportion of 60% ore to 40 coal. The bed so formed is the regular retort charge. There are six distilling furnaces, each containing 240 retorts arranged in vertical rows of three and which are heated by Siemens regenerative firing. The gas for these is obtained from Duff generators, which require from 1 to 1½ tons of coal per ton of ore charged. Each retort furnace receives a charge of about 18 tons of bed mixture, and the yield of spelter is said to be from 90 to 92%, the daily output being close to 25 tons. The crude spelter contains 2% lead and 0.02 iron, and the residue from the retorts 3 to 4% zinc, 10 lead, and a small amount of gold and silver. The lead bars obtained from the condensers, containing about 2% zinc and the bulk of the gold and silver, are sent to the Omaha refinery. The fritted scrapings from the retorts, containing a little zinc, gold, and silver and a great deal of available fuel, are sent to the Pueblo plant, as are the lead and iron concentrates from the mill. The plant makes its own retorts and condensers, using a mixture of New Jersey and local clays. The retorts are made in a hydraulic press, while the condensers are spun round by machine and afterward formed to the required shape by hand, three men turning out about 400 condensers per day.

Black Hawk, Where Smelting Began in Colorado; Iron City Mill in the Foreground.

At the steel works of the Colorado Fuel & Iron Co. there are in operation at the present time 3 blast-furnaces, the open-hearth plant, the wire and rail mills, and a single turn at the bessemer plant. The only important change in the last two years has been that rails are now made entirely of open-hearth steel and none from bessemer steel as formerly. The open-hearth rail lasts longer and is not so liable to break as were the old bessemer rails. The open-hearth mill is producing about 600 tons of rails per day and is using from 30 to 50 tons of iron ore and 75 tons of limestone in addition to the daily output of pig-iron from the blast-furnaces. Over 1000 tons of coal is used per day in this department, coming from Las Animas and Fremont counties. The principal iron ore supply is from Sunrise, Wyoming, but

considerable ore comes from the Union Hill and Jim Fair mines in New Mexico. The Sunrise ore carries from 45 to 60% Fe. Chrome iron ore—for furnace lining—is received from both Wyoming and California, while all the ferro-manganese comes from England by way of Galveston. Limestone is obtained locally from the towns of San Carlos and Tobaseo. There has been no construction during the past year, but at the present time there is a rumor that great improvements are to be made this year. The plant has large orders ahead, but is suffering from a shortage of iron ore just now.

Denver.—The Globe plant, in common with the other American Smelting & Refining Co.'s plants, is operating at about one-half capacity. The Argo plant of the Boston & Colorado Smelting Co. is about to close. Established in Black Hawk by the late N. P. Hill some 38 years ago, and moved to Denver in 1873, this plant has been one of the landmarks of the State. The process used embraced the collection of the precious metals in copper matte and the shipping of this matte to Swansea for refining. When Richard Pearce became metallurgist he introduced the Ziervogel process, in which the silver sulphate in the matte is leached out with water followed by the precipitation of the silver on copper, and of the copper on iron. The treatment of the residues after the leaching of the silver from the roasted ores was kept a close secret until recently, when Harold Pearce explained that the gold was concentrated in copper bottoms, which were granulated and smelted with iron pyrite in a reverberatory furnace. A further concentration was thus obtained, the solubility of gold in metallic copper being greater than in copper matte. These meltings and granulations were continued until an alloy containing from 10 to 20% gold was obtained. This was sent to the refinery, where the same process of concentration was advanced a further stage by repeated melting in crucibles, yielding finally a gold bullion 920 fine and ready for the mint. In a period of 30 years the gold output from this process amounted to 1,532,905 ounces. The Argo was probably the most successful smelter in the West, but with changing conditions and passing of the master mind when Richard Pearce retired, it has gradually declined. The refinery burned in 1906, after which the rich matte was sold to the American Smelting & Refining Co. It is interesting to note in passing one other achievement of Richard Pearce, namely, the development of the reverberatory furnace in copper smelting, which he worked out at this plant, starting with the old Swansea 5-ton furnace and working up to the present 100-ton furnace.

The Modern Smelting Co. has recently erected a pyritic smelter at Utah Junction near Denver, and is now operating one 400-ton furnace. This plant will treat Gilpin county ores and will dispose of its matte to the A. S. & R. Co. There has been an attempt to make this an ideal plant—round sheet-iron tanks form the ore-bins and the plant was so designed that the ore is not to be touched by hand from the time it is unloaded. The ores are not bedded, crushed, or mixed, but ore is drawn from the tanks as needed, mechanically elevated to the feeding floor, and fed from a hopper on one side of the furnace. Apparently the metallurgist can have but a hazy idea of what is on his charge, and this may account for the numerous 'freeze-ups' that have already occurred. The blast is heated in an immense stove, probably the largest in the West. This is another attempt at pyritic smelting, which in almost every case so far has ended disastrously—at least to the stockholders—in the many attempts in this State to establish pyritic smelting with, or without, hot blast. It is true that at Leadville a plant was successfully run up to the time of its absorption by the A. S. & R. Co. It then closed, the company doubtless finding the iron flux more valuable in lead-smelting. It is difficult to obtain copper in Colorado, and it has been fully demonstrated that without in the neighborhood of 1% Cu on the charge the precious metals cannot be saved. One of the earliest attempts at pyritic smelting in Colorado was made at Kokomo, and was followed later on by the Bi-Metallic works at Leadville, and still later by a small plant at Silverton backed by the Guston mine. The most elaborate plant was erected at Florence and ended in disaster—where it was contemplated to treat large quantities of aluminous Cripple Creek ores, but where it was found that these ores worked no better than in the lead furnace. The large works at Golden has been twice resuscitated, and though now dormant are expected shortly to be re-opened by the North American Mines & Smelter Company.

Of the smelters that have in recent times been in operation in Colorado, the following list shows their present condition:

Name.	Remarks.
DENVER.	
Globe	In operation at one-half capacity
Grant	Dismantled
Argo	Closing down
Modern	Starting
PUEBLO.	
Pueblo	In operation at about one-half capacity
Philadelphia	Dismantled
Eilers	Being dismantled
LEADVILLE.	
Arkansas Valley	In operation at one-half capacity
Bi-Metallic	Dismantled
Elgin	Dismantled
Union	Dismantled
SALIDA.	
Salida	In operation at about one-half capacity
DURANGO.	
Durango	In operation at about capacity
GOLDEN.	
Carpenter	Closed
FLORENCE.	
Rocky Mountain	Closed

There are then five smelters in operation at about one-half capacity, and under these circumstances pyritic smelting seemingly will stand but a poor chance, for even if successful the matte must be sold to lead or copper smelters. The crying need of metallurgical circles is more ore, and without the discovery of new camps or a better price for silver—which is not likely to occur—the only alternative is to find a cheaper method of ore reduction. Perhaps it is too much to say that existing metallurgical processes are perfect, but the smelters have reached a very high stage in saving and little more can be done to decrease the small metal losses now made.

JAMES' ANNUAL CYANIDE LETTER.

Written for the MINING AND SCIENTIFIC PRESS
By ALFRED JAMES.

Once more Africa has become, if not the centre of interest, for the year, one of the most interesting centres. For many years, with the exception of the period of the Denny controversies, attention has been directed to Western Australia, New Zealand, and Mexico for the latest improvements in practice. That Africa is once more calling favorable attention to its practice is due in no slight degree to the enterprise and caution of W. A. Caldecott, who, since the retirement of J. R. Williams, of cyanide renown, has apparently been the ruling force in the adoption of solid improvement in practice. Sound in judgment, cautious in committal, and yet enterprising in policy, Mr. Caldecott first came into prominence by his extremely accurate forecasts of the advantages which would result from the adoption of tube-mills in local practice. His recently published paper, showing the work which has led to his recommendation of heavy

Caldecott Slime Table.

stamps, has gained him a gold medal from the Institution of Mining & Metallurgy, and amply justifies the attributes with which this sentence opened. In boldly adopting a vacuum-filtration table for the classification and collection of his sand-pulp Mr. Caldecott has once more shown enterprise and earned high encomium from such experts as J. R. Williams, who is naturally enamored of a sand-product carrying only 1% of slime.

African practice is clearly in a transition stage. The suggestions of the Denny brothers—made too early, possibly, for their general adoption—although received with incredulity and ridicule, have undoubtedly borne good fruit, and while these suggestions may be modified by later available methods and practice, the results accruing from them are undoubtedly materially altering metallurgical practice on the Rand.

From time to time editorials and letters from correspondents assert that filter-pressing on the Rand has been tried and thrown out, but I can find little justification for such a statement. It is true Mr. Albu stated his intention of dispensing with filter-presses at the New Goch because of the difficulty of taking reliable 'lip-samples' when cyanide solution was flowing through the battery boxes (though at the same time retaining them at the Meyer & Charlton), but not only is the original Dehne-press plant at the Meyer & Charlton still at work, but a number of other Dehne plants have since been and are still being installed in South Africa—not on the Rand—as the result of the Denny plants.

It may be taken that the trend of practice on the Rand is to use heavy (2000-lb.) stamps as coarse crushers only, and to crush fine in tube-mills, avoiding the use of amalgamation plates after battery screens, and to amalgamate after the tube-mills only. In some mills the battery screens are as coarse as 3-mesh.

In Western Australia interest has mainly centered on the treatment troubles of the Lancefield and on the introduction of fixed submerged filters at Oroya Brownhill, Lake View, and other Bewick-Moreing mines.

In Mexico good work is being done all the time investigating the conditions for solution of the various silver-carrying minerals, and improving tube-

Interior of Tube-Mill.

milling, agitation, and filter-pressing.

In the United States new plants appear to conform to Mexican practice, the Homestake still standing as the notable example of original methods successfully adapted.

Crushing.—In these notes for last year a prophecy was hazarded that the era of 2000-lb. gravitation stamps would soon arrive. Already stamps of this weight are actually in use. It appears to be established on the Rand that particles 0.25-in. diam., are the largest economically suited for subsequent tube-milling, and experiments there are consequently on a screen of 9 holes (of 0.27-in. aperture) to the square inch. Cabled reports show an output of 17 tons per day from the 1890-lb. stamps of the West Rand Consolidated, and it is suggested that the 2000-lb. stamps at the City Deep will output 20 tons per day. All new stamps appear to be designed from a development of Mr. Boss' suggestion, with long heads, short stems, and low, open-fronted mortar-boxes, without anvil-blocks. Mr. Caldecott's paper in the Institution of Mining & Metallurgy, referred to above, is most interesting and useful, and gives tabulated results with varying factors such as

weight, water-feed, and screen-area. Truscott, however, shows the increased duty to be only directly as the increased weight of the heavy stamps, yet the saving in convenience, cost, and labor on the fewer and larger units is such as to secure their adoption. A most remarkable point the author makes is that, whereas using 8 of water to 1 of ore the crushing duty on the Simmer Deep was only 5 tons per stamp per day containing 11% of plus 60 particles, at the present time using tube-mills as fine grinders, the crushing duty with only 6½ water to 1 of ore is no less than 8⅓ tons per day with only 1.61% of plus 60 for exactly the same cost. They thus obtain a higher tonnage and a higher extraction for the same cost per ton, and effect a saving in water.

In Rhodesia practice is not infrequently materially different from that on the Rand. Just as the Giant for some years pioneered in practice, getting a heavy output per stamp (10 tons per day) so now Rhodesia makes a departure from Rand practice by the adoption of the Chilean mill, though we have as yet no information as to better results having been obtained there than those of Francisco Narvaez at Pachuca, to which I referred in my last notes.

Tube-Mills.—I have in another paper referred to the coarse material (0.25-in.) now being fed into tube-mills on the Rand. From elsewhere one enthusiast advises me of his successful practice with a 1½-in. tube-mill feed. Opinion is still divided as to the most suitable proportion of tube-mills to stamps. At El Oro a much higher proportion is used than in Africa, but the outside figure seems to be that of the Waihi Grand Junction Co. with 9 tube-mills to 40 stamps. At the Benoni, in South Africa, it is proposed to put in 3 tube-mills to every 40 stamp-heads, which is a great advance on local practice. Walter Neal, of the Dos Estrellas, Mexico, wishes me to call attention to a rational development of all-sliming practice. This is to separate at once the original, impalpable slime from the tube-mill slime (granular particles), so that the former may receive separate and usually much more rapid treatment than the latter.

The battle over tube-mill liners is still undecided. Iron plates are used in Western Australia, honeycomb blocks and rib-liners in New Zealand; silex blocks in South Africa; and rib-liners in Mexico. Rib-liners appear to increase the efficiency of the tube-mill, and also the power-consumption, and they also appear to overcome 'slip' of the pebbles. It looks as if rib-liners would be more and more widely adopted, though one is a little surprised at the non-adoption of Barry's convenient and rapidly renewable system of mine-material cemented in honeycomb shells. Mr. Neal's open discharge appears to be gaining ground in Mexico. The convenience of doing away with the pierced baffle-plate or screen is obvious.

Dewatering and Classifying Pulp.—Probably the most original work of the year has been along this line. In America, Canada, Mexico, Australia, and Africa, new and original schemes have been evolved and put into practice. Possibly enthusiasm of the inventor has caused him to dream of displacing filter-presses, decantation plants, and vacuum filters, but without for the moment looking at it from this point of view one has to take note of at least two systems which have come prominently forward during the year. In the first place the Dorr classifier has taken a forefront position in Mexican and American practice. Designed by the engineer who made a success of the Moore filter after the original failure at Mercur, it was a practical solution of one of the two difficulties at that time faced, apart from the operation of the filter itself, namely, (1) the separation of the sand, and (2) the thickening of the slime-pulp. By a simple system of reciprocating scrapers, working in an inclined trough, Dorr separates the sand up to 200 mesh or any required degree of fineness, handling about 700 tons of pulp per day with less than ½ hp. The product is clean and attractive. Mr. Caldecott has been working on quite other lines. By placing a circular board or baffle near the discharge-end of a small (8-ft.) cone, right over the discharge but at the same time clear of the sides except at the point of support, he overcomes the irregular action of those cones caused partly by the collapse at intervals of material settled on the sides, and he keeps the fine-slime in suspension. The sand is delivered to a filter-table somewhat similar to that illustrated by Parrish or Hunt. Mr. Caldecott describes his method in detail in the *Journal* of the Chemical, Mining & Metallurgical Society of South Africa for May 1909, and J. R. Williams tells how he produces a clean product of sand containing only 20% of moisture and 1% of slime. Mr. Caldecott's spitzkasten diaphram—not to be confounded with the baffle used in tube-mill feed-cones (spitzlütten) to divert the upward flow of water from the bottom—appears to be an ingenious contrivance for which he deserves much credit, and his adoption of a filter-table enables him to provide a much drier product (he claims 15% of moisture only) than that from a Dorr classifier. This is, of course, of no little importance where the pulp is to be mixed with KCy solution, but we have no note of the increased cost resulting from the use of Mr. Caldecott's filter, scraper, and vacuum-pump. On the other hand, Mr. Caldecott appears to accomplish, without power, by the mere addition of a fixed diaphragm, what Dorr requires power (little, it is true) and moving apparatus to accomplish.

Solution of Metals.—The use of the Brown agitator has progressed by leaps and bounds. In Mexico and the United States no new plant appears to be considered up-to-date without it, and already its use has spread to eastern Asia, India, South Africa, the West Coast of Africa, and to South America. Singularly enough, Australia appears to be the one gold mining territory, though the agitator originated in New Zealand, in which this appliance has not yet been adopted. The reason for this may lie in the cessation of construction of new plants rather than in a lack of appreciation of the efficiency and economy of the new method of agitation. Already, indeed, operators seem to be trying to still further improve the work of the agitator. Henry L. Swan proposes to economize by his patented system of re-heating the air and thus to make it go further as well as to obtain the advantage in extraction and settlement resulting from the employment of heated solutions. In Mexico, C. V. R. Cogswell proposes the adoption

of ozone instead of air. To the lay mind it may appear to be a rather expensive substitute, but facilities for the manufacture of ozone appear plentiful at Guanajuato and we may yet hear more of the suggestion. The method proposed by Messrs. Grothe and Mennel, of continuous treatment in Brown agitators, can scarcely, however, be favorably considered. A system of continuous decantations, using these tall tanks for this purpose, would not only involve what the industry is now trying so hard to avoid, namely, the handling of the huge quantity of solution per ton of slime treated, but also the idea of settlement in tanks not so fitted for this process as the shallow tanks of great superficial area in use in South Africa. Thus, if slime settles 6 inches in one hour, in a 60 ft. diam. tank 10 ft. deep, this

Brown Agitating Tanks at Pachuca.

means 1414 cu. ft. of clear solution per hour, as against only 88 cu. ft. in a much more costly tank 15 ft. diam. by 45 in. deep. What the industry is set on obtaining is a high extraction with the handling of only one, or at most two, tons of solution per ton of dry slime treated.

Recovery of Gold or Silver-Bearing Solution.—This, in other words, is the crux of the slime-treatment question, and has probably during the past year attracted more attention from skilled men than any other phase of the metallurgy of the precious metals; nor have the efforts put forth been successful. New methods on entirely new lines, with both natural and assisted settlement, have been promulgated. Their success in practice has yet to be accomplished.

It is of course well known that originally J. R. Williams evolved a decantation system for South Africa, and Messrs. MacIntyre and Sutherland a filter-pressing system for Australia. The former method has been carried to a remarkable degree of efficiency, superior to the results obtained by the Mexican pressure-filters, and practically equal to those of the fixed submerged filters, by means of huge and costly plants, costing in some cases upward of £50,000, and handling up to and above 12 tons of solution per ton of dry slime treated. There now seems little reason to doubt, however, that even on low-grade African slime the adoption of filter-pressing would have been of great advantage, and would have saved heavy loss and much capital expenditure. Apart from the greater cheapness of a filter-press plant, and the heavier cost of working, amounting to more than 5d. per ton, there is the question of depreciation, which in decantation plants is a heavy figure, even if one takes the life at 15 years. It is now admitted that on the best Rand plants there is a loss of not less than 8d. per ton of dissolved gold run away with the residue. Filter-presses would have recovered 7d. of this, and would have saved the cost of handling of huge quantities of solution. But it must be remembered that the good decantation results shown may only obtain at the best plants. The letter published by George Mackenzie of the Adair-Usher Process, Ltd., in the MINING AND SCIENTIFIC PRESS, July 17, 1909, shows how much behind these figures some of the other plants were. The best Rand slime-plants now have four transfers, and handle three of water to one of settled pulp at each transfer. Treatment-costs, however, are low, varying at the mines of the four chief groups (Eckstein, Rand Mines, Gold Fields, and East Rand) from 10.33d. at Knights Deep, including cyanide and supplies, to 1s. 6d. at Simmer Deep, 2s. 6d. at Jumpers Deep, 2s. 10d. at French Rand, and 4s. 7d. at a well known mine (for accumulated slime, current pulp being handled much cheaper) for the months reviewed. Experiments with vacuum filtration have shown, however, that a final residue of 0.15 dwt., or an extraction of, say, 92.5% is possible with a dissolved value remaining in the residue of under ½ grain of gold per ton of dry slime. The best present practice appears to show an extraction of close to 88%, allowing for gold in solution flowing away with the residue. To revert, however, to the newer natural or assisted settlement methods of recovering solution, that which first occurs to one as possibly the best tested is the Dorr pulp-thickener. Dorr, however, does not appear to claim, as do others, that his thickener is available as a complete treatment scheme, but regards it as an accessory to filtration. This thickener consists of an ordinary slime-settling tank to which is fitted a scraper arrangement revolving at a very slow rate, say five revolutions per hour, and thus taking very little power. The scrapers deliver the settled, thickened pulp at an outlet at the centre of the bottom of the vat. If the delivery is continuous the pulp is reduced from, say, 10 of water to 1 of dry slime to 1½ of water to 1 of dry slime. If worked intermittently an output of 1 of water only to 1 of slime appears to be maintained without difficulty.

An enterprising endeavor in Mexico to obtain a highly thickened pulp ought here to be mentioned. A cone 34 ft. diam. by 35 ft. high is fed with 400 tons of dry slime per day, containing 9 of water to 1 of dry slime. The underflow contains not less than 3.5 to 4 tons of water to every ton of dry slime, with an absolutely clear overflow. If, instead of one cone only, a series of smaller cones had also been used, results might have been obtained more nearly resembling those of the Messrs. Denny in Africa. From their 35-ft. cone H. S. and G. A. Denny obtained an 18 to 25% product from a feed of 3000 tons of pulp, that is, dry slime plus solution, per day. This was further thickened in eight small cones, worked in two series of four each, down to 35% of solid matter. Another method of settlement comes from Australia. Pulp is settled in a cone, and the thickened pulp-overflow at the bottom is received on a belt caught between consecutive series of rollers which squeeze the pulp between the upturned sides of the belt until a thick, somewhat caked product is delivered. This scheme does not appear to have yet established itself practically.

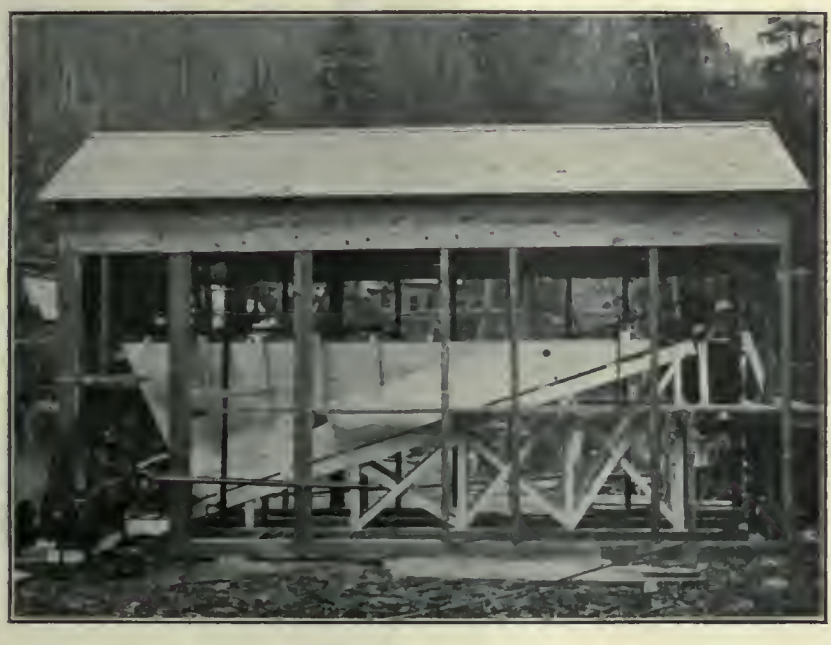
From Africa comes the Arbuckle process. In this system the pulp flows into a cone, and the thickened pulp is caught between rollers which deliver it sausage-fashion. I understand the experiments originally conducted by one of the most enterprising of the local groups did not result sufficiently favorably, but other groups appear now to have acquired an interest in the process, which is stated to take the sand-pulp as it comes and to deliver an absolutely continuous output of thickened pulp, sand, and slime together, containing only 20% of moisture. From a glance at the patent illustrations it would appear as if the arrangement of rolls were not yet sufficiently practical for ordinary usage. But even if the machine will do all that is claimed, it is still a long way from a simple one-treatment equal-solution process superior to decantation, and equal in recovery to filter-pressing, though the figures certainly look attractive; for, assuming that the ordinary mill-pulp is de-watered down to 20% moisture, and that the thickened pulp is diluted with KCy solution to 2 to 1, and agitated, and again de-watered to 20%, then there is a recovery of $1^4/_5$ tons, or 90%. This is not nearly a high enough recovery of dissolved metal, and the pulp is again handled for another recovery of $1^4/_5$ tons, or $3^3/_5$ tons of solution in all, and a 99% recovery of dissolved metal, which, for reasons to be shown later, is the lowest recovery one can afford to be content with in practice even on low-grade (1½ to 2 dwt.) slime. There would be three transfers, two agitations, and two precipitations, with $1^4/_5$ tons of solution for each ton of slime, using the second wash as original solution for the next charge, with a consequent slight lowering of the percentage of recovery.

The most recent settlement process comes from Canada and differs from the others in that the inventor delivers his settled thickened pulp under water, and thus avoids the difficulties incidental to all other methods arising from the pressure of fluid above the thickened pulp outlet that is liable at any time to rush through channels of least resistance. Horace G. Nichols has described his apparatus in a paper to the Institution of Mining & Metallurgy (Vol. XVII, p. 293) and more recently in *The Mining Magazine* for November 1909. Briefly, his apparatus consists of a V-shaped inclined trough with a box-bottom in which a continuous belt operates under the longitudinal opening along the bottom of the V. The thickened pulp is deposited through the opening at the bottom of the V onto the belt which, operating in water or pulp at an angle of 18°, which is also the angle of the bottom of the trough, has its upper end emerging from the water at the end of the trough. The thickened pulp adheres to the belt and is stated to be not disturbed during its slow travel through the water. The thickened pulp is detached at the upper end of the belt after it emerges from the surface of the pulp by a system of water jets or by a scraper. Mr. Nichols claims a settlement to 27% moisture, and it will be seen that the considerations applying to the Arbuckle settler apply with still greater force to the Nichols apparatus, and that a very large amount of solution, say, 8 to 1, must be handled and precipitated to effect a 99% recovery. The idea, however, is certainly ingenious, and seems more practical than the Arbuckle in its patented form. Even if it is not as useful as a treatment-process as the author hopes, it would appear to have a field as a de-waterer or as a de-solutionizer prior to thorough washing-filtration, though it would be well to know more of the working of the method for keeping the box-bottom, in which the belt moves, clear of the thickened pulp.

Having thus dealt with the recent settlement-processes, it becomes necessary to consider the results of the much advertised vacuum-filters. If one regard the work of the fixed immersed type of vacuum-filter in Mexico or elsewhere, that type being most generally adopted, it is found that its function appears to be mainly that of a settler, and that whether one uses natural settlement and drainage, a pressure-filter, or a fixed immersed filter, the resulting recovery is almost the same, namely, the total solution less the 33% or so remaining in the thickened pulp. Recovery is therefore increased by the dilution of the original pulp; the more dilute the pulp the higher the recovery. My observations in Mexico led me to ascribe to the fixed submerged type of vacuum-filter in Mexico a recovery of 77 to 89% of the metals in solution. The latter looks like a high figure, and is obtained usually by taking the original solution, say 2 to 1 of dry slime, and deducting from it the 30% of moisture still remaining in the thickened cakes or settled pulp, representing a recovery of 85%. When the proportion of solution is higher, say 2½ to 1, the recovery is still greater, being 89%. Of course it will be found that the cakes discharged from the filter usually carry more than 30% of moisture. At one of the well known plants, for instance, the moisture is 45 to 50%, but this may be taken as mainly water introduced at the time of discharge. This result, apparently high, is confirmed by taking the advertised records and omitting the washing, which shows 87% extraction. Prior to the introduction of these filters much higher metal values were simply flowing away, so that in spite of low re-

coveries the introducers of these filters have done a great service to the industry; but even taking an ore worth only 30s. per ton, and assuming an extraction of 90%. equivalent to 27s., then the loss is not less than one-tenth of 27s., or 32d. per ton of ore, almost the whole of which would be recovered, at an extra expense of 6d. only. by Dehne presses, or without extra expense by the employment of thorough washing instead of mere settlement.

In the above remarks I have not referred to the traveling basket filter of the Moore or Barry type, as this is on quite a different footing from the non-washing, fixed, immersed, or pressure-filters. The Moore and Barry filters do good work, and it has been a matter of some little surprise that the former has not been more widely adopted in Mexico. Indeed, the decision of the Dos Estrellas company not to install the Moore filter so impressed me that I had special enquiry made into the matter. It appears



Nichol's Slime Settler.

that the Moore costs are higher than those of the fixed submerged filters, and that there is a liability to breakage of baskets which is extremely costly and inconvenient: that twice at Pachuca the baskets have been dropped, intentionally or otherwise, and smashed. This seems a poor argument for not adopting a high-recovery filter unless costs are very much higher, which might show bad design or bad management—or more probably that the Moore filter is handling at Pachuca straight slime, that is, slime not previously treated by decantation, instead of the decantation residue frequently fed to filters of the submerged type. Even so, the cost at Pachuca should not exceed 8c. per ton of dry slime or 6c. per ton of solution recovered. As for the smashing of frames, this is a mere question of mechanics which has been satisfactorily dealt with at the Liberty Bell, Waihi, and elsewhere, and can be as readily disposed of in Mexico.

There can be no question of the superiority of the results of the traversing type to those of the present fixed submerged type, and anyone can see this who will take the trouble to read the remarks of the workers of the latter type (see, for example, A. M. Smith in the MINING AND SCIENTIFIC PRESS, July 10, 1909). They actually at Goldfield run their discharged submerged filtered residue into a pond with wash-solution, settle the residue behind a dam, and decant the gold-carrying wash-solution, and then run on a further 15,000 or 20,000 gal. per day as a further wash to absorb and save the gold-bearing solution remaining in the residue. This water they subsequently decant and return.

To recapitulate, the position of slime-treatment appears to be as follows: The only methods giving really efficacious results, recovering not under 99% of the gold dissolved, are the Ridgway filters and Dehne presses. The former is handicapped by the necessity for a feed of thick pulp (not over 50% moisture) for cheap work (4d. per ton), but now that slime-settlers are advanced to such a degree as above indicated (the effluent containing 20 to 30% only of moisture) the securing of a proper thickness of feed should be a relatively simple matter. Again, the Ridgway is handicapped by the requiring of skilled supervision. I am inclined to agree with this view, but on the other hand the skilled supervision, as well as the repairs, are all included in the above working cost of 4d. per ton. Similarly, the Dehne press is limited by the greater cost of operating it, namely, 1s. per ton, but it can handle thin pulp and gives a high recovery.

Next to the above, and close to them in point of high recovery, comes the Barry (crush) filter. This appears to have the advantage over the Moore of a better plate and of no blowing back of displaced metal-carrying solution. The necessity of acid treatment of Barry's filter-leaves is unknown; the cloths are brushed or washed when taken off for repairs, and they last for months, in some cases for more than a year, and the cost appears to be between 4d. and 6d. per ton of dry slime handled.

It says much for the Dehne press that no instance has yet occurred to my knowledge of it being displaced by a vacuum-filter, with the possible exception of the Ridgway at the Great Boulder and of the Barry at Waihi. I have to place the Moore after the Barry, owing to its less efficient frame and the loss of dissolved metal-value from the blowing back or reverse pressure of fluid, that is adopted for dislodging the cake. There was much trouble to get over this with the Ridgway when it was found that the metal-values blown off were not of valueless wash, but rich in gold. The amount of loss from this cause varies with the construction of the frame; for the above type it may be assumed at under 5 per cent.

I said at the beginning of these notes that one could not afford to be content with a less recovery than 99% of the dissolved metal-content. With a

1½-dwt. extraction and a pulp containing 40% of solid matter a washing displacement of 69% (equaling a total recovery of 96%) shows on 100 frames, handling eight charges per day, a loss of £2500 per annum in unrecovered metal. If better designed plant operating at precisely the same expense gives 92% washing displacement (readily obtainable in practice) the loss of unrecovered metal is only £700 per annum. Even if one allow ½d. per ton higher cost for more efficient washing, the total net gain would be not less than £1500 per annum. I calculate the efficiency of the machines or methods as below:

	Recovery of dissolved metal values.	Cost per ton of dry slime.
(A) Ridgway (automatic)	99.5% (averaged over a month on 500 tons per day).	4 to 5d. (actual).
(B) Dehne (filter press)	99% (with efficient washing).	1s. (actual).
(C) Barry (Crush) (traversing basket vacuum filter).	96% (as used at Walhi).	5 to 7d. (actual).
Barry (possible).	99% (with modified wash).	
(D) Moore (traversing basket vacuum filter).	91%.	I estimate at 8d. plus royalty (stated in Mexico to be higher than (F) Brown (old costs) 31c.
(E) Rand Decantation.	Either side of 85%.	6 to 8d. omitting solution costs.
(F) Fixed Immersed Filter (coir leaves non-wash).	77 to 89%.	I estimate at 6 to 10d. (acid alone may be 2d.) Bosqui (old costs), 26c.
(G) Pressure Filters Non-Wash (without power).	61 to 76%.	3½d. (filter by gravitation without power).
(H) New Ridgway Non-Wash (500-ton unit).	66 to 70%.	1d. (actual).

I purpose here to refer to the new type of Ridgway filter (500 ton per day unit), regarding which I hitherto have given no details, as it appeared to me that, working without washing, the results could scarcely command serious attention. In view, however, of the enterprise which has induced them in Mexico to recover considerable metal from their decantation residue by means of pressure-filters, figures on this machine will probably be of interest. This filter differs from the standard Ridgway filter in that each flat plate is substituted by a basket or group of five vertical plates; the machine has eight times the surface of the standard Ridgway. It has been in regular use in Australia for some 2½ years, has never failed to treat the whole product sent it, amounting at times to 687 tons (dry weight) per day. It is reported to work automatically and without attention save for one man of superior grade on the day shift, no labor being employed on the afternoon or night shift. The costs, approximating 0.906d. per ton, are stated to be as follows, including purchased power at a high cost measured by ampere metre:

Power for vacuum and for turning machine, 45 hp., at 3s.	13s.	6d.
Labor for running filter, one man at 10s. per day	10s.	
Repairs and upkeep have proved infinitesimal, say	5s.	
Cloth, 10 yd., at 7½d.	6s.	3d.
Light, oil, waste, and sundries	3s.	
Total	£1	17s.	9d.

The feed into the machine is 50% solid, or apparently precisely similar to that fed into the pressure-filters at Mexico El Oro. They claim a high figure for recovery, based on the paucity of value in the treated product. Working as they do, however, I estimate it at 70% only. From the above figures this filter would appear to have some value as a cheap final method of recovering metal from decantation residue. For some time past, however, they have been using this machine on direct pulp with washing, but for this purpose I have as yet no figures which enable me to recommend its use.

Difficulties.—The chief difficulties in treatment encountered this year appear to have been due to pyrrhotite and graphite. Investigation on the former was carried out years ago by A. C. Claudet, who obtained entirely satisfactory results from fine grinding and agitating with dilute cyanide solutions. A plant on these lines, namely, stamp-mill, tube-mill, agitator, and filter-press, was laid down in Korea and operated by Mr. Marriner with entirely satisfactory results, without roasting. Graphite has, however, caused much more difficulty. Finely divided, and resembling an oily scum or film on the surface of the solutions, it has caused much trouble in Australia and in India. On looking up previous experience on the subject I find that at Charters Towers an old sailor made £30,000 by sun-drying and disintegrating, prior to cyanidation, heaps of old graphitic residue previously deemed untreatable. By this means 4 to 6-dwt. tailing was reduced to ½ to 1 dwt. at a cost of 3s. 6d. per ton, including carting. Generally, the difficulty caused by graphite has been overcome when roasting (which is the natural remedy) is not employed, by agitation with air, or by exposure to the sun for a period of six months or a year, with subsequent disintegration and aeration.

Errors in Estimation of Gold in Solutions.—Whitby states (*Journal*, Chem. M. & M. Soc. of S. A., May 1909) that he could show figures giving losses as high as 70% of the total gold in slime-pulp residue by simple evaporation, and in practice, using the greatest care, the loss seldom fell below 30%. All solutions should be evaporated gently with litharge.

Cleaning Up.—Tilting furnaces gain in favor as the use of them extends. A tilting furnace, with oil-burner, as used by Mr. Yates is ideal for running down gold precipitate. Unfortunately, however, when power runs short, the amount of air used by such a burner becomes no longer a negligible factor.

DREDGING AT NOME IN 1909.

Written for the MINING AND SCIENTIFIC PRESS
By Our Special Correspondent.

Seward Peninsula is on the eve of great development in dredging. At the beginning of the season of 1909 five dredges were in commission and two more were started by midsummer after remodeling and repairing them. Before the close of the season four more were completed and tried out to the satisfaction of their owners. At least eight additional dredges will be shipped here on the opening of navigation in 1910, and the promoters of these new ventures have every confidence in their success. Those that have operated the entire season are the Three Friends Mining Co., the Nome-Montana-New Mexico Mining Co., the Sievertson dredge, the Blue Goose Mining Co., and the Wonder Dredging Co. The Nome Mining Co.'s dredge and the Kimball dredge operated the latter half of the season, while the Gold Beach Mining Co., the Gold Bottom dredge, the Warm Creek dredge, and the Goose Creek dredge, were completed near the close of the season and operated just long enough to insure the harmonious working of their various parts.

'Three Friends' Dredge on Solomon River.
Built by the Bucyrus Company.

The dredge of the Three Friends Mining Co. was built on Solomon river in the summer of 1905 and was operated about 30 days at the latter end of the season. This is its fourth full season, and while it is difficult to obtain exact figures as to its output, it is well known to have paid handsome profits every year since it was built. It is a 5-ft. close-connected Bucyrus dredge driven by steam-power and averages 75,000 cu. yd. per month from the middle of June to the middle of October, which is the full dredging season in this climate. Its fuel is coal and is shipped here from the outside at a cost of $20 per ton laid down by the boat. Its actual operating costs are 11c. per cu. yd., and its total costs, including winter care, repairs, and amortization of capital are 18c. per cu. yd. I can state with certainty that more than 50% of its gross output is net profit.

The dredge of the Nome-Montana-New Mexico Mining Co. is also on Solomon river, and was built in 50 days last season. It ran 55 days at the latter end of the year and has had a season of 143 days this year. It was necessary to close down the dredge for the crew to make the last outgoing steamer; otherwise. the season would have been considerably longer.

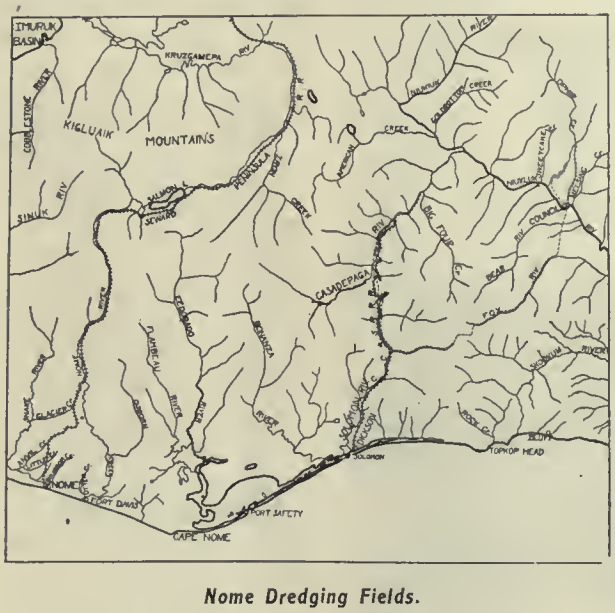
The dredge has a 5-ft. open-connected bucket-line with revolving trommel and pan stacker, and the machinery was built by the Risdon Iron Works, of San Francisco. It is driven by steam power, uses 4.6 tons of Wellington coal per day for fuel, and averages 60,000 cu. yd. per month. It is credited with an output of $200,000 for this season, and its profit over operating costs has paid for the dredge and a large tract of ground upon which it will operate for several years to come, and has left a substantial cash balance in the treasury besides. For some months the operating costs were 11c. per cubic yard. The ground averaged 9 ft. in depth. High bedrock and frost were encountered in the earlier months, while in October frozen overburden was a detriment to high capacity. It would seem possible to operate dredges far into November in this district where it is possible to flood the ground ahead, thereby preventing the freezing of a crust and where there is no liability of ice jams. Two men for each 8-hr. shift were employed as a rule, but in June and October, when the rigors of the winter were in evidence extra labor was employed. The digging efficiency of this machine was 89%; of the total lost time 10% was employed thawing frozen spots. The plant is equipped with compound condensing engine, surface condenser, and locomotive type of boiler, and is considered one of the most economical to operate in power and labor in the district.

The Sievertson dredge, also on Solomon river, is a small machine driven by gasoline engines, and having a 1-ft. open-connected bucket-line. This machine would probably be regarded by dredge men gen-

erally as a toy or plaything, but the fact remains that it has made over $15,000 profit for its owners this season, and is good for like returns for several seasons to come.

The Blue Goose Mining Co.'s dredge is on Ophir creek in Council City district. This has a 5-ft. open-connected bucket-line with shaking screens and belt stacker and was built by I. B. Hammond of Portland, Oregon. It is driven by steam-power, burns wood for fuel, and averages 30,000 cu. yd. per month. Wood costs $12 per cord laid down at the dredge. It has been operated on Ophir creek for three years on leased ground and has paid 30% of the gross output as royalty to the owners of the ground. It has paid dividends to its stockholders amounting to more than the cost of the dredge and has a cash reserve in its treasury of over $20,000. Owing to extensive repairs which were made at the beginning of this season the dredge is regarded as being as good as new.

The Wonder Dredging Co., operating on Wonder



Nome Dredging Fields.

creek near Nome, has a 9-ft. close-connected bucket-line, revolving screen, and belt stacker, and is driven by electricity. The power is generated by the Nome Mining Co., which is closely affiliated with the Wonder Dredging Co. The power-plant is situated near the mouth of Bourbon creek, and burns crude oil, which is piped from the coast to the plant. The generator is direct-connected to a turbine engine and generates 500 hp. The Wonder dredge pays one-half the costs of operating and maintaining the power-plant, and I am informed that the average cost to the dredge for this season has been $3000 per month. The dredge has averaged 50,000 cu. yd. per month, and the gold tenor has averaged 50c. per cubic yard, or about $1000 per day gross output.

The Nome Mining Co.'s dredge operates on Bourbon creek near Nome. This dredge was built last year, but seems to have been an ill-starred enterprise from the beginning. It is a 9-ft. close-connected dredge of Bucyrus type, and its construction was undertaken by a man by the name of Smith, who contracted to build it for $97,000, and it is said that a complete machine of that size and type should have cost at least $140,000 in this district. The result was that the machine was poorly constructed throughout. It is driven by electricity which is generated at the company's own plant already described.

The Nome Mining Co. and the Wonder Dredging Co. are both flotations of E. E. Powell, and while operated under separate heads are closely affiliated. They are backed by Eastern capital. Shortly after the Bourbon Creek dredge was started last year, and before they had dug a pond large enough for swinging room, they had the misfortune to tear the side out of the port pontoon with the bucket-line and the dredge immediately sank. It rested on an uneven bottom and was warped out of shape and the machinery was thrown out of alignment. After several attempts it was finally floated, but no further operations were attempted last year. At the beginning of this season, under new management, the boat was completely overhauled, the hull and gauntrees strengthened, and many expensive changes and additions were made to the machinery, and finally near the end of August it was again started to work. It has had about 50 days of running, but has had delays and mishaps for which the present management is in no way responsible, but due entirely to faulty construction. I have no definite data as to its output, but am informed that the results have been fairly satisfactory.

The Kimball dredge on Ophir creek was also remodeled early this season, and it is now a fairly complete dredging plant. It is mounted on wheels and leaves an open drain behind it. It has 1-ft. buckets, and handles an average of 300 cu. yd. per day. It is driven by gasoline and has paid a good profit over operating costs the last half of this season.

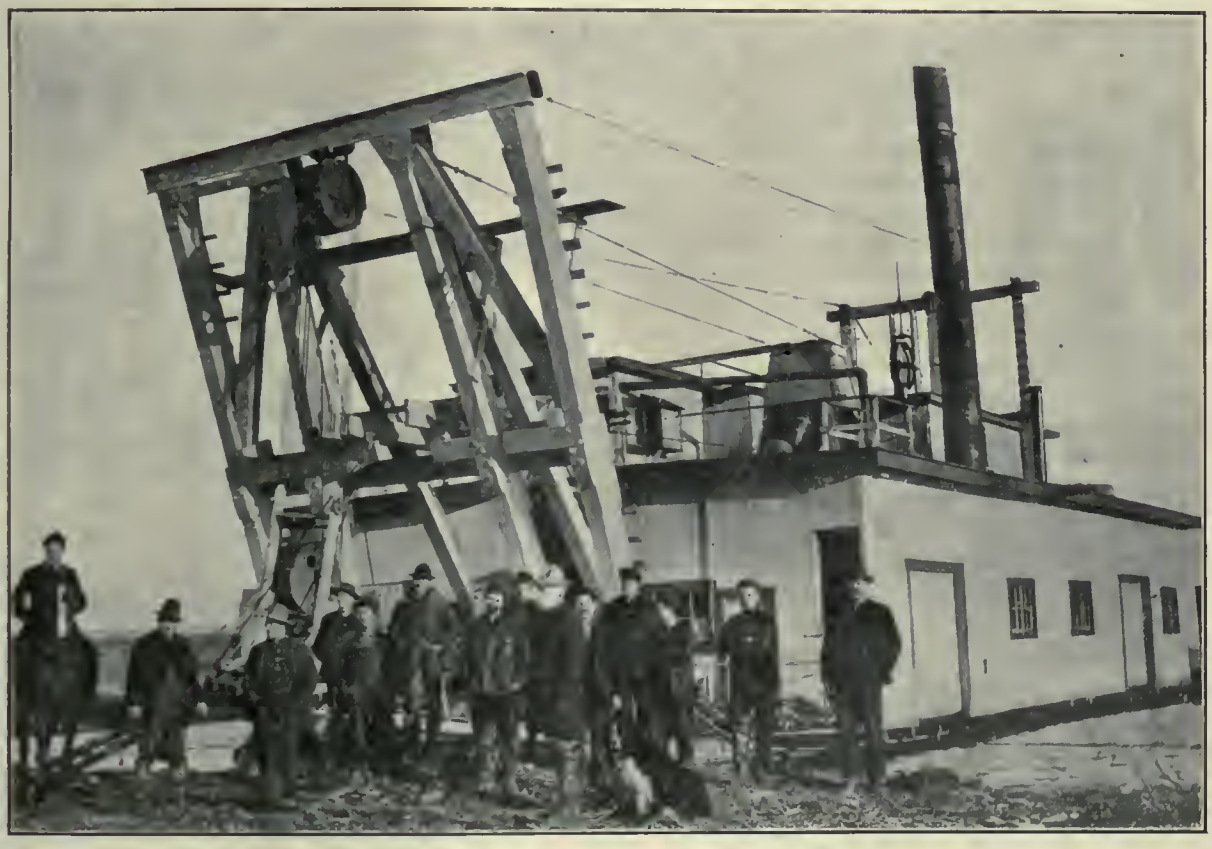
The Gold Beach Dredging Co. has recently completed a dredge on Dry creek near Nome. It has a 5-ft. open-connected bucket-line, a revolving screen, and belt stacker. It is driven by steam-power and burns crude oil, which is delivered by gravity through pipe and hose from a tank on the high bank of the stream. This is a Hammond dredge and was built in Portland to be used somewhere in Oregon, but the enterprise fell through and the dredge was bought at a bargain-counter price and shipped to Nome last spring by its present owners. It was completed too late in the season to do more than test it this fall, but it appears to be a substantial machine, and will probably give a good account of itself.

Jere Wilson, the Ophir creek pioneer, has built two dredges in the Council City district this season. One is on Gold Bottom creek and the other on Warm creek. They are essentially duplicates and were built from Mr. Wilson's own designs by the Byron Jackson Iron Works of San Francisco. They have 2¾-ft. open-connected bucket-lines, revolving screens, and belt stackers. They are driven by gasoline engines; each machine having a 40-hp. and a 25-hp. Western gas-engine. The hulls are 26 by 50 ft. and they draw 30 in. of water. They cost $40,000 each complete and ready to run. About $5000 of this amount was for river freight from the mouth of Fish river up the Niukluk river to where they were built. They were built to dig in shallow ground (6 to 12 ft.) with soft schist bedrock, and containing gold in amounts that will just pay to shovel into sluice-boxes. Mr. Wilson expects these machines to average

1000 cu. yd. per day each, and he has ten years work ahead of each machine. He ran them just long enough this fall to try them out and to confirm his expectations both as to the dredges and the ground.

Another small dredge was built this summer at the mouth of Goose creek, a small tributary of the Casadepaga river. Its designer is Ben Benard, and he and Messrs. Moore and Ryan, of Portland, Oregon, are its principal owners. It was built in Portland. It has a 1-ft. open-connected bucket-line, revolving screen, and pan stacker. It is driven by a gasoline engine and cost about $6000. It would probably give reasonable returns on the investment if it were on some one of the many small rich streams with which the country abounds, but they were so unfortunate as to build it on a high bar of the Casadepaga at the mouth of this small tributary, and they found when they were ready to launch it that their pit would not hold water, so now they will probably mount it on wheels.

Of the new dredges for which arrangements are now being made, one is to be built on Otter creek, a tributary of Nome river. It is to be a 3-ft. steam-power dredge, and will be owned by a local company, of which Rowley Andrews, of Seattle, is president, and Joseph Plien, of Nome, is vice-president and manager. They have a large tract of promising ground near the mouth of Otter creek. Another is to be built on Arctic creek, a tributary of Cripple river, about 20 miles west of Nome. This one is to be built by Mr. Braucht, who is one of the large stockholders in the Gold Beach Dredging Co. that has just completed a dredge on Dry creek. Another is to be built on Solomon river just below the mouth of Hurrah creek. This one is fathered by C. Floding, of Chicago, who is heavily interested in the Solomon River Hydraulic Co.'s ditch on Solomon river. Another is to be built on Solomon river above the mouth of East Fork. Frank I. Reed is the leading spirit in this venture, and I understand that Mr. Pearson, manager for the Nome-Montana-New Mexico Mining Co., is taking an interest in Reed's venture. Another is to be built on Spruce creek, which flows into Bering Sea about eight miles east of the mouth of Solomon river. This one will be built by Mr. Sievertson, who has had such signal success with his small gasoline dredge on Solomon river. Another is to be built on Pine creek, which flows into Bering Sea about midway between Solomon river and Spruce creek. This one will be built by Mr. Condee, who has long been connected with the Three Friends Mining Co. on Solomon river, and who after this year will be its general manager. Mr. Condee will build a 3-ft. close-connected dredge with revolving trommel and pan stacker. After having made careful comparisons between the belt stacker on the Three Friends dredge and the pan stacker on the Nome-Montana-New Mexico dredge operating in the same area, he has become convinced that the pan stacker is more economical in this climate. He will use distillate engines to generate his power. Another is to be built by Bernard Peterson and Linder on Saunders creek, a tributary of Hastings creek, about ten miles east of Nome. Another is to be built by Frank H. Waskey on lower Iron creek, a tributary of Pilgrim river. The plans for all these dredges are already well under way, and there are rumors of others that may possibly materialize before spring. There can be no doubt the output of gold from Seward Peninsula will be vastly increased by all these machines,



Nome-Montana-New Mexico Dredge on Solomon River.
Built by Risdon Iron Works.

and it will shortly exceed its banner year when the Third Beach at Nome was so productive.

There is undoubtedly a great field in Seward Peninsula for dredges of about 3-ft. capacity, and even though the operating year is only of about four months duration, the gravels are so loose and free from boulders and clay and so rich, as compared with other dredging fields, that the profits will compare excellently with the most favored localities in other parts of the world. I say this, too, with full knowledge of the fact that Seward Peninsula has been condemned as a dredging field by no less an authority than C. W. Purington, who, after spending a part of the summer of 1904 here, published a letter in the MINING AND SCIENTIFIC PRESS of July 28, 1906, in which, after recounting the disadvantages of short seasons, permanent frost, etc., he used the following language: "I therefore unhesitatingly condemn the Seward Peninsula as a dredging province. By this, I do not wish to say that rich placers do not occur there. The gold is there, but among the methods of working, dredging is not to be considered." I will grant at once that the dredging of frozen ground is not to be considered, but the whole of Seward Peninsula is a succession of hills and valleys, and in every valley is a stream-bed. These stream-beds are rich in gold, and the flats over which the streams meander are not frozen, but are loose gravel and sandy sediment, and offer ideal conditions for dredging; the one drawback being that the year must be crowded into four months, from June 15 to October 15. The real consideration, however, is the profit to be derived from the operation. We are told by D'Arcy Weatherbe, in his excellent work, 'Dredging for Gold in California', that the dredges at Oroville, California, which is considered by Mr. Purington to be an ideal field for dredging, are making from $2000 to $5000 profit per month. This means $24,000 to $60,000 per annum. I think I may say that Seward Peninsula in its scores of stream-beds offers much greater area in square miles of dredging ground than are reckoned to be in the three great dredging districts of California, and our past experience warrants the belief that dredge for dredge, the advantage for annual profit lies with the Peninsula. Our stream-beds are mostly shallow, being from 10 to 25 ft. deep. We have no cemented gravel and few large boulders. The bedrock is usually decomposed if schist, and much shattered and broken, if limestone. We do not need such enormous strength in our dredges, nor can we use advantageously such monster machines as are in use at Folsom, but for dredges of 3 to 5-ft. capacity we have here a splendid field, and there is plenty of room for all who will earnestly investigate it.

Lime in presence of calcium carbonate may be determined, according to Heyer, as follows: In a 500 c.c. flask shake up 2.5 gm. of the sample with 125 c.c. water. Then add 125 c.c. of 2% NH_4Cl solution, stopper, and shake at intervals for some time. Then dilute to the mark, mix well, and allow to settle. Withdraw some aliquot part of the clear solution and titrate with N/10 acid. The alkalinity represents CaO as $CaCO_3$, does not react with NH_4Cl in the cold.

YUKON TERRITORY IN 1909.

Written for the MINING AND SCIENTIFIC PRESS
By Our Special Correspondent.

The gold output for the past season will probably exceed that of 1908 by $500,000, making a total of approximately $4,000,000. This increase is due to the new production of The Yukon Gold Company. The dividend of 8%, declared by that company this season was a matter of much satisfaction. It demonstrated beyond doubt that the Klondike is still capable of producing gold at a profit. We, of the Territory, of course know this, but there is nothing like a dividend to impress outsiders. The management of The Yukon Gold Co. deserves much credit, since they have overcome difficulties that the engineer not conversant with Arctic conditions wholly fails to realize. The record of their dredges for the past season is noteworthy, especially as all the ground dredged had to be thawed by steam, and there were also constant difficulties due to working over previously drifted ground. The company owns 7 dredges; 6 of these worked all summer and dug approximately 2,250,000 cu. yd.; the seventh boat did not get to work in earnest until late in the season. These boats started digging late in May, and were all closed for the season by October 7; 139 days work, including many trifling delays. The record is excellent, and credit is due to E. E. McCarty, superintendent of dredging for the company. There was 750,000 cu yd. of gravel hydraulicked during the season. The water for this purpose came from the reservoir at the head of Bonanza creek, and also from the big ditch completed this summer. The ditch was the main source of supply and furnished 2500 in. of water all summer. It would have been possible for the ditch to have carried fully 4000 in., but owing to lack of equipment delayed in transit, it was not necessary to force the ditch to its capacity. The missing equipment finally arrived, and was at once installed, but too late to do much work. It is, however, ready for next year. A remarkable record was made at the power plant, at the head of Little Twelve Mile river. The loss of time at the power house was only twenty minutes in the entire season. No shut-down was necessary anywhere for want of power. The capacity of the plant is 2000 hp. This fall sees all contemplated construction work finished. The last of the work to be completed was of a group of buildings situated at the mouth of Bonanza creek, which is the centre of the company's holdings. The group includes: a machine shop 40 by 128 ft. will contain machinery for all dredge repairs of a general character; a plate and bucket shop 60 by 40 will contain rolls, shears, and all plate machinery, for either making or repairing buckets, and screens; a dredge-repair parts warehouse 100 by 40; a cold and warm storage warehouse 100 by 50; a cold storage warehouse 100 by 40; a barn 125 by 40 capable of taking care of 40 head of horses; a two-story mess and bunk house, large enough for 50 men. These buildings are all of the same character, that is, substantial frame, covered with galvanized corrugated iron, and so symmetrically grouped that they present an ad-

vantageous appearance. They will enable the company to do its work more cheaply, and in many ways cut down expenses now unavoidable on account of the scattered condition of the plant. O. B. Perry, general manager, left for the outside late in September. C. A. Thomas, resident manager, remains in the country for the winter.

Joe Boyle is again at the head of the Detroit Gold Mining Co., and is operating a 7-ft. Marion dredge, in the Klondike valley, on what is known as the Boyle Concession. Mr. Boyle has had a long hard legal fight over this property, covering several years, this he has finally won. It is understoood now that all law troubles are over, that this property will be worked on a larger scale possibly by the addition of two new dredges of latest design and large capacity. This company also expects to install a hydro-electric plant on some of the tributaries of the Klondike river. The present power is generated by a steam-plant. Fuel for this plant, wood being used, costs the company $15 per cord. This is too expensive. It is likely that the water-plant will be installed next summer. Mr. Boyle will probably remain in the country during the winter. The Lewis River Gold Mining Co.'s dredge, of which Edward Simpson is manager, has secured a lease of four more creek claims on Bonanza creek. This will keep the boat steadily at work for about two years more. The past season has been a successful one. R. H. Milvain, manager for the Walkers Fork Gold Dredging Co., has had the first really successful year of work. The boat worked smoothly and handled a lot of dirt that contained gold in excess of $1 per yard. The boat was built by the Risdon Iron Works of San Francisco, and is a 5-ft. open-connected dredge, of the usual design. There is every reason why this company should duplicate the success of the past season, as the ground is well prospected, the management will be the same, and a large property is controlled.

A new company made up of Canadian and English capitalists and known as the Northern Power & Light Co. began business with headquarters in Dawson last spring. It has absorbed the Sour Dough Coal Co., The Dawson Electric Light Power & Water Co., The Dawson Telephone Co., and the Grotcher Concession, which is a mining location at the mouth of the Klondike river. The new company is installing a 3000-hp. steam-plant at the mouth of their coal mine on Coal creek, 30 miles by power-line from Dawson. This will allow them to burn their waste coal. The plant will, it is expected, generate approximately 3000 hp. The plant will be complete in all details, and the power-house will be made of reinforced concrete. The company is capitalized for $3,000,000, the securities being held principally in Toronto and London. It is planned to supply power to the Forty-Mile river and the Dawson dredging fields during the early and latter part of the open season. Water-power plants in the North are not ready to start as soon as dredging can be commenced, on account of being situated at greater elevation than the dredging fields. Two weeks in the spring and two to three weeks in the fall may be added to the dredging season when this company's power is available.

RAND PROGRESS IN 1909.

Written for the MINING AND SCIENTIFIC PRESS
By Our Johannesburg Correspondent.

Labor.—To open this review with the statement that 1909 has been a 'remarkable year' in the history of Rand mining, might not only be orthodox journalism, but would constitute at the same time a glaring truism. Every year has its events and changes of importance. A mining industry producing $150,000,000 and supporting 200,000 workers which can pass 12 months without remarkable experiences ceases to conform to natural laws and thus becomes more remarkable than ever. It is only necessary to mark the most significant events and tendencies of progress. Several advances have been made in the technical methods, which promise to influence the course of future events most beneficially. But above all else the lessons of the year have taught us (what a period of good fortune almost tempted us to forget) that with an abundant supply of cheap, unskilled labor the Rand can attain to vastly greater heights of accomplishment than it has yet reached, that this supply is ever an unstable and disturbing factor, and that especially without the aid of the 'constant' represented by 50,000 Chinamen, all our plans for expansion may at any time be frustrated by seasonal variations in recruiting results.

At the end of 1908 and early in 1909 there was an influx of native labor of unexampled magnitude. The following figures will demonstrate this fact:

Period.	Whites.	Natives.	Chinese.	Non-whites.
January 1904.....	12,814	75,027	.....	75,027
January 1906.....	18,582	93,933	47,166	141,099
January 1908.....	17,522	133,515	33,849	167,364
January 1909.....	19,801	169,537	11,534	181,071
March 1909.....	20,548	180,103	10,021	190,124
April 1909.....	20,756	181,389	8,308	189,697
June 1909.....	21,620	175,895	7,317	183,212
August 1909.....	22,062	168,357	5,354	173,711

The March figures constitute a record for total unskilled laborers, and April for natives. The drop of about 20,000 in a few months has had a crippling effect upon certain mines. When labor was so plentiful the stock market was buoyant, and a policy of expansion prevailed. The demand for laborers began to increase more rapidly than the supply, and when the latter fell, the demand showed even a further growth, as new plants and extensions were completed. To find a simple metaphor, the influx of labor enabled new ships to be built which the exodus now left without crews. The labor question is always a highly controversal one, full of speculative factors, and there is hope of the industry being able to adapt itself to the less favorable position.

Industrial Movements.—The various features of the year's industrial expansion may be surveyed under four heads: (1) production; (2) mill enlargements or construction; (3) development and exploration; (4) amalgamation.

1. The records of production do not truly reflect the activity of the year, for the reasons that floods in January and February adversely affected operations, and that the chief progress has been in work preparatory to milling, the results of which are yet

to come. Tabulated, the returns have been as follows, the last three months of 1909 being estimated:

Year.	Tons milled..	Stamp duty per 24 hr., tons..	Waste sorted, tons	Value of yield.	Yield per ton, shillings ...
1908.....	12,196,589	6.27	15.5	£28,810,393	31.39
1909, estimated	20,750,000	6.80	15.0	30,000,000	28.90

These figures are for the Rand only, the outside districts accounting for an additional 4 to 5%. The drop in yield per ton is an important point. The contribution from new low-grade mines has influenced the average, but nearly all companies have individually been treating lower-grade ore, which the reduction of costs has thrown over the margin of payability, and which cannot, as actuarial principles would prove advisable, be left for treatment till all the richer ground has been exhausted.

Village Deep, Capacity 50,000 Tons per Month.

2. New mills have been completed during the year upon the Knight Central (22,000 tons monthly capacity), Bantjes Consolidated (10,000 tons per month), and Vogel Deep (10,000 tons). The first-named has been producing for several months, but the Bantjes has postponed milling pending the duplication of the plant, and the Vogel Deep has been awaiting labor. A large number of companies have increased their milling capacity, either by the erection of stamps and tube-mills, as the Robinson, Van Ryn, New Modderfontein, Cinderella Deep, Nourse Deep, Consolidated Main Reef, and Main Reef West, or by the addition of tube-mills alone, as the Village Deep, Ferreira, and Durban Roodepoort Deep. The aggregate influence of the large-scale producers—apart from those represented by recent amalgamations—has been rapidly on the increase. In 1906 there was only one company crushing over 40,000 tons per month; in 1909 there have been 14. Or, to look at the advance in a different light, the average tonnage crushed per company monthly is now 29,000, as compared with 10,000 tons five or six years ago.

3. The most significant results of the year's activity have been apparent in the accomplishments of the developing mines. The record of work done in shaft sinking and development has been exceptional. Over a dozen mines call for notice. In the East Rand, the Cloverfield, the Apex, and Van Ryn Deep have all cut the Main Reef in their new vertical shafts. The Brakpan, Rand Collieries, and Van Dyk have continued an active development policy—the first with particularly favorable results, closely corresponding with those obtained in the New Modderfontein mine two miles away. Shaft sinking has been commenced upon the Springs Mines and the Welgedacht. The East Rand Extension and the Boksburg Gold Mines have been re-opened. At the Modderfontein 'B', shaft sinking and development have been proceeding with payable results. The eastern district of the Rand, in which all the above properties occur, has been progressing far more rapidly than any other region. The rich ore found in the Brakpan No. 2 shaft and the steady advance of the Modderfontein-Kleinfontein properties have been largely responsible for stimulating operations throughout the area. In the Central Rand, the most cheerful quarter has been at the City Deep, Ltd., in which development started in September 1908. The early results, at a depth of 3000 ft., were good—too good to last, was the common opinion. As the drifts proceeded east and west, and were eventually connected up between the two shafts (4000 ft. apart), it became evident that the zone of highly payable ore, of better average grade than that of the corresponding outcrop mines, is of great extent. There are today developed fully 1,600,000 tons of ore, going approximately 8.8 dwt. over a stoping width. The proportion of unpayable ore is very small.

Village Deep. Battery and New Tube-Mill Plant.

It is indeed a remarkable fact, the possibility of which would scarcely have been credited a few years ago, that the connecting level between the shafts and beyond (6000 ft. in length), has revealed

payable ore throughout. All these encouraging results have been obtained on the Main Reef Leader—the South Reef having been disappointing to date. The adjoining mine, the Village Deep (including the old Turf Mines), has also done a great deal of development at depth, and unfortunately has a different tale to tell. During the year the Turf shaft cut the South Reef at 3815 ft., and the Main Reef Leader and Main Reef at 3894 ft. vertical. The assay results, more or less confirmed by subsequent development, averaged the same as the upper portions of the Village Deep—payable and little more. Better grade has lately been exposed on the 4000-ft. level. There seems to be little chance of getting the mine out of the ruck of a 6-dwt. mine grade, though there is still a big gap between the Village Deep workings and the Turf Shaft, in which City Deep grade has a chance of showing itself. There is also hope of improvement below the Turf shaft. In the westerly districts the most noteworthy developments have been in the Bantjes Consolidated, where the South Reef is opening up well, in the Vogel Deep, which has been prepared for production, the Main Reef West, where some high-grade Main Reef Leader has been exposed, and, away in the Far West, in the Randfontein Central where (presumably, for little is heard of the operations of the ill-controlled Robinson group), active development is proceeding in preparation for the 600-stamp mill under erection. Whether the results are good and whether the mine will be ready for the mill are trivial questions beyond the knowledge or concern of the 'investor' in Randfontein stocks. An annual statement is the utmost to be expected.

4. The policy of amalgamation, under which adjacent companies are consolidated (sometimes with previously unfloated ground added), and placed under a single management, has been practised with notable results during the year. The consolidations have all taken place between mines of the same control—with certain unimportant exceptions, when equipped but poor or practically exhausted properties have been involved. This feature, no doubt, consequent upon the obvious difficulties of amalgamating differently controlled mines, promises to provide a constant check upon many fusions, which would be advantageous and are prompted by natural conditions. The chief amalgamations of the year have included the following: (1) Crown Mines, Ltd., comprising Crown Reef, Robinson Central Deep, Crown Deep, Langlaagte Deep, Paarl Central, South Rand, Langlaagte Royal, and other ground. The Crown Mines, Ltd., under the management of R. C. Warriner, has been producing since July. With 675 stamps and 15 tube-mills, it crushes 130,000 tons for a profit of £110,000 per month and a yield of £220,000. (2) Randfontein South G. M. Co., Ltd., comprising the North, Porges, Robinson, South Randfontein, and Stubbs Randfontein. With 400 stamps in four mills, it crushes 90,000 to 95,000 tons per month, for a yield of 29s. per ton. (3) Randfontein Central G. M. Co., Ltd., comprising all the subsidiaries from the Block A to the Johnstone Randfontein. Preparations are in hand for the equipment of this northern area with a 600-head mill (heavy stamps), and 16 tube-mills, designed to treat 160,000 tons per month. (4) Geldenhuis Deep, Ltd. The fusion of the Jumpers Deep, Ltd., and Geldenhuis Estate (almost exhausted) with the Geldenhuis Deep has lately been accomplished. (5) Rose Deep—Glen Deep, long regarded as an 'obvious' case for amalgamation. (6) Lancaster—Lancaster West.

The negotiations proceeding during the year for the acquisition from the Government of the right to mine under water-rights, bewaarplaatsen, and machine stands are of importance. Whether the Government is justly entitled to take the full proceeds of these proposed sales is open to doubt, but it is generally manifest enough to what parties the rights should be sold for maximum profit. The direct interests of the State in Rand mining possibly will be increased further by the leasing of large areas of Government ground in the East Rand, for which tenders were called during the year. The terms of flotation and the scale of royalty participation determined by the Government have not proved attractive to financiers. Investigations have also been made, jointly by Government and the Chamber of Mines for the acquisition of a mine for use as a training place for miners. The York mine, at Krugersdorp, was examined with this view, but the conclusions arrived at have not been made known.

Mining and Metallurgical Improvements.—While the use of electric power has been gradually extending, it will be in a later review that the wide adaptation of power supply from central stations—generating electricity and compressed air—will call for description. The Victoria Falls Power Co. has two large power stations in the East Rand. It remains for the new Rand Mines Power Supply Co. to effect the electrification of the mines of the great Wernher-Beit-Eckstein group. The trials of the machines entered for the Stope Drill Competition have been continued steadily throughout the year, under hard working conditions, which should leave no doubt as to the superiority and reliability of the finally adjudged winner. The six drills surviving the tests have been: (Hammer) Climax Imperial: (Reciprocating) Chersen, New Century O. O., Holman 2¼ and 2⅜, and Siskol. In regular practice, some remarkable machine work was done at the New Modderfontein, where a drift was advanced 826 ft. in 156 successive shifts, with two 3¼ Ingersoll-Sergeants. Ventilation has come in for a greater share of attention. At the East Rand Proprietary Mines, Ltd., a 10 ft. 6 in. diameter Sirocco form, with a nominal capacity of 300,000 cu. ft. per minute at 4-in. water gauge, has been installed for the ventilation of the Angelo-Driefontein portion of the mine. It is reported that the Village Deep is also to be equipped with mechanical ventilation.

The erection of great mills and the advance of the big-scale operating policy have tended to create changes in underground development systems. The influence has been a gradual one, bearing toward long backs, mechanical haulage in main levels, supplemented by some scheme of mechanical or gravity-delivery of broken rock from the stopes to the drifts. Whether gravity planes, air-winches, or steep passes to foot-wall cross-cuts are the most economical is an

open question, largely governed by variable local conditions, with strong advocates on opposing sides. The system of sand-filling old stopes with cyanide residue has been introduced experimentally at the Robinson mine. The sand is sluiced down a small launder to the wide workings or Main Reef and Leader, nearly below the mill and not only is it providing greater security against cavings, but enabling rich pillars to be extracted.

In the field of metallurgy, there have been several important developments. With the increasing weight of stamps and adoption of coarser-mesh screening, the utility of amalgamation below the stamps is becoming less evident. The tendency is to amalgamate only on the shaking tables below the tube-mills—a principle embodied in the new Bantjes mill, at which all gold extraction occurs under one roof. In some old mills the plates have been removed from the mortar boxes to a separate room, allowing better control and increasing the aggregate plate efficiency. The necessity under the new law of covering plates (as well as zinc boxes) has prompted some mill-men to increase the intervals between the dressing of plates—with satisfactory results.

The influence of heavy stamps in Rand battery practice has attracted much attention and has been fully discussed by W. A. Caldecott before the Institution of Mining & Metallurgy. It thus calls for no further reference here. At the Knights Deep, a number of the trials have been undertaken under the auspices of the Mines Trials Committee, to determine the economic limit to coarse-crushing in stamp-mills, for certain ratios of stamps to tube-mills. It was found that for 20 stamps to one tube-mill, 9-mesh is the coarsest practicable, though 4-mesh was tried. With stamps of 1400 to 1500 lb., the 9-mesh screening gave a duty of 14 tons per 24 hours. At the present time, plants are equipped with tube-mills on the basis of one to about 40 to 50 stamps; at the Village Deep, however, the ratio is 1 to 30, and the 180 stamps are expected to treat at least 50,000 tons per month—when the ore can be provided.

The Caldecott filter-table, one of the important improvements erected at the Simmer Deep and Simmer & Jack, for the collection of practically slime-free sand, has been doing good work throughout the year. Adequate descriptions have already appeared in the MINING AND SCIENTIFIC PRESS.

Next year it will probably be possible to give data regarding the local applicability of two metallurgical methods, as to the financial and technical efficiency of which no reliable data are yet available—namely, milling with cyanide solution (without amalgamation) and the vacuum filtration of slime. In this connection, it is most satisfactory to observe that Eckstein & Co. have engaged the services of F. L. Bosqui, whose positive qualifications are too well known to readers to require statement. But Mr. Bosqui is also equipped with one negative qualification of no little importance when he is called upon to pass judgment upon these moot questions. He is unbiassed by Rand history and free from the influence of those subtle indefinable prejudices which are apt to spring up in every mining centre.

PROGRESS AND PROBLEMS IN ORE DRESSING.

By COURTENAY DE KALB.

Science has not done as much as it should for concentration in the last 60 years. A few more things have been learned concerning principles, but Von Rittinger told us nearly all that we know today. Progress has been mainly along mechanical lines, in the perfecting of machinery, in the handling of larger tonnages with no greater expenditure of power, and without reducing the percentage of saving. The progress of an art must be gauged by its practical application of new knowledge. By that measure the conclusion is inevitable that concentration has lagged behind other arts practised by the mining engineer. The new principles introduced have, with few exceptions, received only a limited application. Whatever may be the ultimate importance of radically new systems, the percentage of the world's ore-tonnage treated by them today is small as compared with the quantity of ore still concentrated by methods which have an ancient lineage.

The most important novelties in ore dressing may be quickly summarized. Advance has been made in magnetic concentration, and where these methods are feasible they have attained prominence as standard practice. The zinc industry depends upon it to separate certain iron minerals from sphalerite, and to take up sphalerite, leaving the accompanying galena behind. The magnetic permeability of a mineral is affected by such minute quantities of FeO that the so-called 'concentrated field magnets', with a current of 10 to 14 amperes, will discriminate between two such closely similar substances as corundum and emery, containing respectively about 0.05 and 0.3% FeO. The electro-static process likewise represents the introduction of a new principle into concentration. This depends upon the repulsion between particles carrying electric charges of like sign. The minutiae of the process need not be given. Suffice it to say that this represents one of the higher examples of the application of science to ore dressing. It still requires perfection of detail to overcome difficulties due in part to atmospheric conditions and loss of potential; its limitations can not be predicted in any individual case in advance of direct experiment, but it has its own important field of usefulness, which will enlarge as investigation continues.

Along with this may be mentioned the flotation processes. Here accident has led the way to a study of selective action between oils and gases for certain minerals. This promises to admit of an extremely wide application in the arts. It is said that some careless boy tending concentrators in the plant of the diamond mines at Kimberley, South Africa, used a greasy rag to wipe the tables, and that the diamonds adhered to the greasy surface that was thus produced. Being quicker of wit than energetic of body he applied more grease, and saved the diamonds with less attention to the concentrator. This discovery by a 'do-less' boy has now become

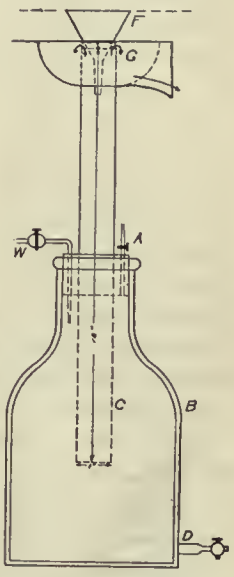
the accepted method for recovery of diamonds from their gangue. The extension of the principle followed naturally to other minerals. The metallic sulphides, particularly those of a greasy nature, such as stibnite, molybdenite, galena, chalcocite, argentite, tellurides, and even gold, silver, and copper, display such selective preferences. In the Elmore process heavy oil, such as the black oil remaining as a residuum after petroleum refining, is agitated with the pulp, the oil adhering to the sulphides and causing their flotation to the surface. If this selective action were perfect, concentration would at once settle down to a matter of mixing pulp with oil; but it is not perfect: the oil will stick to the gangue to some extent; it will fail to stick to the sulphides sometimes; it will float up the middlings.

There is no panacea for all the ills of the ore dresser. Use of sulphuric acid has been resorted to; this in part renders the quartz gangue incapable of holding the oil; in part it liberates carbonic acid gas from the pulp which forms bubbles around the sulphide particles, giving them such buoyancy as to float them, with or without the aid of oil. In the Potter and Delprat process buoyancy caused by liberated gas is relied upon, aided in Delprat's application by densifying the solution with common salt. In all cases the surface tension of the minerals is increased by heat, so that the temperature of the pulp is brought up to over 100° F. by steam coils. These processes fail precisely where practically every concentration process fails, that is, in the treatment of slime. In magnetic concentration the fine gangue is caught up in the nests formed; or is mechanically conveyed with the magnetic minerals through interference; the same difficulty interferes with the electro-static method. Slime concentration is perhaps the most difficult problem in ore dressing, and the farthest from a satisfactory solution.

An interesting adaptation of the principle of surface tension is that of the Coates tube, better known as the Macquesten flotation method, used at the Adelaide Star mines, Golconda, Nevada. Sulphides do not become wetted as readily as quartz and silicates; hence if the ore is presented at a proper angle to a quietly flowing body of water, certain sulphides will float away, while the gangue will sink. As Robert H. Richards remarks, "the process depends upon a delicate balance of small forces."

Nevertheless the present attempt to turn to economic account the persistent tendency of small particles of metallic sulphides to float, which has always been a cause of loss in concentration, is a welcome effort of inventive genius. Decrepitation has also been advantageously employed, different minerals decrepitating at different temperatures. Thus barite flies to pieces at a lower temperature than zinc blende. Common salt can be purified from magnesium chloride in like manner, and the decrepitated salt is less ready to absorb moisture from the atmosphere than it was before such treatment. The decrepitated mineral can be separated from the unaffected substance by subsequent screening.

Pneumatic concentration has made but little advance. The control of air currents is even more difficult than that of water currents. The formation of currents is a matter so obscure that but little real knowledge exists regarding it. The hydraulic engineer will bear testimony as to the uncertainties of determining weir contraction, and the difficulties there found are magnified as soon as water or air is forced through a confined space. From this results a series of baffling obstacles to accurate separation in classifiers and jigs, which theoretically should be extremely perfect instruments. Prof. Richards sought to overcome the abnormal behavior of classifiers by giving a whirling motion to the separating column in a classifier. The result was highly beneficial, but a simple rotation of the water-column was not obtained; other currents are nevertheless present in the revolving mass. He also undertook to correct the work of a jig by supplanting the reversal of direction in the concentrating medium with a body of water moved constantly upward by rapidly alternating impulse. This has produced a jig of extraordinary efficiency, and one that takes advantage of the moment of greatest difference between the rates of falling velocities of the heavy minerals and their associated particles of gangue. The efficiency of any hydraulic separation depends primarily upon the absence of interfering currents. The anomalous conditions met in this respect may be illustrated by the peculiar behavior noticed in a glass laboratory classifier, an apparatus which is not unlike the Robinson coal washer. The pulp is fed through a funnel F concentrically into a separating cylinder C passing through a cork and extending at least as deep as the centre of the bottle B. Through the cork pass two tubes, one for fresh-water feed W, and an air-outlet tube A, admitting of a complete replacement of air from the bottle. When full of water and overflowing into the gutter G, the pulp is fed, and the particles of greater mass fall to the bottom of the bottle, while the lighter material discharges into the gutter. This is a classifier of superior merit, but under the best conditions the erratic motions of particles within the cylinder C give evidence of disturbing currents. Moreover these currents are not continuous as to position, direction, or velocity. If now the discharge-cock D at the bottom of the bottle be opened to admit of even an insignificant discharge, an elliptical current will be induced in the lower part of the cylinder C, utterly destroying its efficiency as a classifier. An example of this kind, showing what small factors will exaggerate the tendency of currents to develop in a moving mass of water, reveals why most classifiers perform such erratic and unsatisfactory work. The same difficulty has been experienced in settlers, and in spitzkasten. A steady onward sweep of a



superficial mass of pulp over a quiescent body of water beneath, would be an ideal condition. This is what mill-men supposed they were obtaining until it was shown by means of glass spitzkasten some years ago that such a relation never exists. It may be rudely approximated by a careful adjustment of the angle at which the pulp is fed into the settler. The Von Rittinger spitzkasten was a pointed box with the water-surface constituting a segment of a circle. The friction along the sides of the box formed another disturbing element. Since the principle of the settler was to cause a current to successively drop finer material carried in suspension by reducing the velocity through an enlargement of the width of the channel, the logical thing to do was to feed the pulp centrally to a round tank discharging peripherally. This form of spitzkasten is superseding other designs of settlers, although the feed-sole used is generally so imperfect as to greatly interfere with efficient settling. The pulp-stream must be diverted to such an approximately horizontal direction as not to create seriously disturbing currents within the tank. As in the case of classifiers, the settler should theoretically discriminate so perfectly between particles of varying mass that these should be susceptible of accurate grading by such means. Indeed, the results should be apparently more accurate than with classifiers, because under ideal conditions the particles are dropped out from a shallow layer of pulp, so that the effect of interference should be less. In effect, however, settling from currents of progressively decreasing velocity yields less accurate classification than the vertical current or spitzlutte type of apparatus, because erratic currents are evidently present in even greater degree. Once more it is worth while to emphasize the fact that to a large extent efficiency in classification depends upon controlling interfering currents, and this difficulty, which has proved so serious in hydraulic classifiers, is greater where air is used as the separating medium.

Notable mechanical progress has been made in the development of belt and table-concentrators, both of which date back to early periods in the art of ore dressing. Two principles are employed in this branch of concentration, namely, that of simple friction between the particles and the supporting surface, and that of difference in momenta of particles of different mass; with the carrying power of the current as a factor present in both cases. The ancient form of inclined plane, and the fixed convex buddle, are examples of the type utilizing friction alone in conjunction with a thin sheet of water to sweep away the gangue. The buddle is theoretically a highly perfect instrument, giving an expanding surface over which the water flows with decreasing velocity toward the outer rim. Its disadvantage lies in relatively high cost of plant for a given capacity, large floor-space, large quantity of water needed, and an excessive demand for labor, together with the fact of its operation being necessarily discontinuous. Automatic continuous buddles have not overcome all these disadvantages, and disturbing currents are more readily developed upon them than need be the case on fixed buddles. The riffle-table is a development from the plane percussion table. The riffles reduce the erratic influence of cross-currents, and keep the pulp from being too swiftly carried down to the tailing-discharge. These machines also utilize the principle of momentum. The heavier minerals and large gangue-particles settle upon the table, and remain there by reason of the friction during the forward impulse of the table. At the end of the stroke the particles of greater mass (which is the product of the weight into the volume) are projected farther than the lighter particles, thus effecting a separation. Manifestly the ideal condition would be to suddenly depress the supporting surface at the end of the forward stroke, so as to relieve the particles from further friction against the table, permitting them to describe their trajectories as free-moving masses suspended in the sheet of water. This problem has not been satisfactorily solved. A differential velocity between the forward and the return stroke would also facilitate the separation. It is evident that the opportunities for improvement in riffle-table concentrators have not yet been exhausted.

Vanners hold an even course as competitors against the riffle-tables. Their efficiency is unchallenged, and many of them afford a fair approximation to the vanning motion of a shovel-point in the hands of a Cornish miner. The degree of economic concentration attained by any form of slime-concentrator, however, is relatively low. It seldom exceeds 75% of the contained metallic minerals when those minerals are chalcopyrite, pyrite, zinc blende, and others of moderately high specific gravity. The percentage of recovery usually increases with a higher specific gravity of the mineral, for obvious reasons.

There are, however, fundamental difficulties in the concentration of slime which must be briefly considered. The definition of the word 'slime' would give rise to dispute. The fact is that slimes are of many kinds, and they may be only rudely classed into distinct varieties. So far as the shapes of the particles are concerned the extremes may be represented by finely comminuted granular quartz at one end, and the exceedingly fine and infinitely thin scales of sericite at the other. These promptly become complicated by argillaceous matter, and by colloids which are never absent. Considered merely as a mechanical problem it is evident that in proportion as the number of particles in a given volume increases the number of interferences to settling is multiplied. Thus Prof. Richards found that when the smaller sizes of particles are reached the laws so carefully worked out for the falling velocities of ore-particles in water fail completely. The difficulty, however, is not purely mechanical. Whitney and Ober announced, "We seem forced to recognize electro-static charges on suspended particles, and it seems just as necessary to accept the conclusion that, as a result of these charges, suspended particles whose masses are small enough are equally distributed throughout the liquid, and are prevented from ever coalescing or settling because of the mutual repulsion of these charges. This mutual repulsion might also cause measurable osmose and correspond-

ing osmotic pressure." Colloids also assume such charges, and the static charges of electricity must be neutralized before coagulation is possible. In the process of crushing silica, silicates, and some other minerals in water, colloids are produced, the quantity so formed depending upon the time of trituration. Every grain will be found enveloped by a film of colloid, in addition to that which may be present as free colloid, either as gel or sol, in the solution. Here is a powerful agent for the prevention of settling. In some ores the reactions occuring between the substances present may result in the formation of electrolytes, serving to effect coagulation. Thus is explained the more ready settling properties of certain slimes. The presence of an acid, a salt, an alkali, in fact any electrolyte, will coagulate colloid particles, the acids flocculating the electro-negative colloid particles, and the alkalies the positive. The subject is full of complexities, which have been only imperfectly studied as yet, and the practical application of such theoretic investigation as has been made awaits the labors of future experimenters. (See W. B. Hardy: on the Mechanism of Gelatin in Reversible Colloid Systems. Proc. Roy. Soc. Vol. 66, 1899.) Until further research has elucidated the problem it is uncertain how far colloids interfere with the concentration of slime, but that they do affect it adversely appears certain, and the importance of coagulation as a preliminary to treatment on slime-tables has been shown in a few cases in practice where the addition of lime to argillaceous ores has improved the recovery.

It is also clear that the deliberate production of colloids by crushing in water may often be detrimental to subsequent concentration. Cushman has shown that the amount of colloid produced by wet grinding is dependent upon the time, which offers a valuable hint. The quantity may become as great as 20% with rock containing no clay or kaolinized minerals. It would not be surprising to find that preliminary drying of ores would in some cases promote free concentration to such a degree as to prove economical in practical operation. Experiment is the only way to determine the point. Each ore is a problem in itself.

Consideration of the fact that colloids are formed by crushing wet, calls attention to the absence of careful studies of the phenomena of ore crushing. The effect of the moisture absorbed in the ore as it comes from the mine is a matter regarding which no detailed investigations have been made. The distribution of compressive strains through a rock must be greatly influenced by the water present, and the manner in which these strains are distributed is important in the degree of communition which results. A spherical mass under compression between two opposite points of contact behaves much like a beam under compression. An elongated ellipsoid resists the compressive strain, expanding transversely until rupture occurs, but before the limit of rupture has been reached that part of the sphere outside of the ellipsoid, that is not under compression, is sheared off. Thus a number of coarse pieces are broken away which do not suffer comminution except along the surface of the ellipsoid where cohesion is overcome at the moment of fracture of the surrounding mass before the ellipsoid yields to rupture. The amount of fine material produced may therefore depend greatly upon the quantity of water held in the pores of the rock. This is true particularly of rock-breakers and rolls, which apply the crushing force along radii making an angle with each other, and to stamp-mills which crush diametrally. Shearing machines, which crush tangentially, are little used in this country except in laboratory work, but the effects obtained by grinding in Chilean mills, where radial, diametral, and shearing strains are all successively induced, are worthy of critical investigation, especially when crushing is being done for the sake of subsequent concentration. Fine comminution has become more common in American milling practice within the last five years, both for concentration and for cyanidation. In both cases the production of colloids is disadvantageous, and it has but recently been recognized that they are a direct result of crushing. The next line of enquiry should be to ascertain how to reduce the amount of this substance, while attaining the same degree of fine-grinding by economical means. As division of labor increases the economic efficiency of men in manufacturing, so the division of duty between machines must be carefully studied. In South Africa costs are being reduced by coarser crushing in stamp-mills, followed by tube-milling of a better adapted product. Incidentally it may be remarked that if dry crushing prove advantageous, the tube-mill is the ideal dustless machine for that purpose.

The tendency in American ore dressing has been steadily in the direction of simplification of processes. The European methods incline to greater complexity. Differing labor conditions are doubtless responsible for this variation in practice. Refinement of detail demands more men. Hence the American is complaisant in the face of losses which would shock a German metallurgist; but the excuse offered is that of 'economic waste.' It is worth while, however, to question our procedure and compel more frequent demonstration that the waste is truly economic. It is easy to err by following a fashion to which the euphonious name of 'standard practice' is applied. The obstacles to clean extraction, as I pointed out, are chiefly three; interferences between the particles themselves, which applies to every stage of concentration processes; erratic currents which defeat the ends of separation in classification, jigging, and table or belt-concentration; and the electro-static repulsions between the particles in the pulp. To a considerable extent the law of probabilities is operative in these various processes. Division of the process into stages increases the probabilities in favor of effecting the separation desired. Only painstaking experiment on a working scale, with comparison of costs, can determine the proper balance between simplicity and greater elaboration of method. My only purpose in directing attention to this matter is to sound a warning that the practice of today need not necessarily be taken as the best to be slavishly followed tomorrow.

SINALOA AND WESTERN CHIHUAHUA.

Written for the MINING AND SCIENTIFIC PRESS
By G. L. SHELDON.

When I left Culiacan about the middle of last May, T. Desmukes, who is manager of the Bismuth King mine, of Chacala, was bringing in a plant of machinery. John Wilkinson, in charge of the Quebrada Honda, at Realito, was also hunting freighters for machinery for the mine. J. T. Canfield had made arrangements with H. G. Zeigler to install a plant at

San Blas Mountains.

the San Fernando mine for an interest. They had gone up on the mountain, more than a mile from the former works, and had opened up the same vein. It was here 20 ft. wide, and assayed 1 oz. gold and 15 oz. silver per ton. At Naranjos, Ysabel Serrano is developing the Bueno Suelto, a large vein of silver, gold, lead, and zinc. James Fitzgerrald, at Santiago de Los Cabelleros, is continuing the development of the Los Tajos; he already has silver ore blocked out, containing a million ounces. The intention is to put on a plant of machinery after the rainy season. Juan Ibarra had just sold his interest in the Los Reyes, a recent discovery of high-grade silver, to people from Culiacan. E. C. Scott and D. H. Friesbe, were working the Rosarita at Nogales on a bond and lease, and had already taken out several thousand dollars worth of high-grade silver ore. Near them Wm. Gordon had just discovered some high-grade silver ore in his Frinijita, which he had been working faithfully for 18 months. At Copalitos are some large silver veins capable of producing upward of 300 tons per day of 20-oz. ore, with some gold, awaiting capital for development. The San Javier silver mines of the Martinez de Castro family are idle; also the mines at Lobitos in charge of Tom Roe. The Geo. Holmes property at La Cumbre de San Manuel, just over the line in Chihuahua, was being examined by an English company.

At the Santa Matilda mine near the Rio Guisinora, which is the east fork of the Sinaloa river, one day's ride from Guadalupe y Calvo, Mr. Cowan and son, and Mr. Lewis were erecting a 30-ton stamp, concentration, and cyanide mill. About 15 months previous they commenced to clean out the old mine. There was not much ore in sight, but it turned out better than expected. They now have two years' reserves of ore blocked, that will mill $40 per ton, two-thirds of the value being gold. This ore is a free-milling oxidized red quartz. In cutting hitches for stulls in the old works in the wall-rock, they discovered an 18-in. quartz vein, full of native silver. In some places the rock hangs together with the silver. The property is only a few hundred yards distant from an extensive lime-andesite contact, the ore being in the latter.

At Calabacillas the last 10 stamps and cyanide plant recently completed by Fred Pelham are running satisfactorily; each month a gold bar is shipped. The development at the tenth level shows wide orebodies. A. J. Underwood who has been manager for the past three years, is now the consulting engineer. He also developed the Lluvia de Oro for two years. He is succeeded in the management by a Mr. Husper, from Cananea. The Calabacillas vein is on a contact between andesite and rhyolite which can be traced some distance to the south, but there are no known ore-shoots near the surface.

Near Tollana, Norman Tracy is continuing development on his El Patagón mine. He has a lot of high-grade ore stoped and awaiting treatment during the rainy season when water is available. Near the State line between Chihuahua and Sinaloa on Peñasco creek, is a pretty gold prospect called Pasadena, occurring in the lime. The owner has been four years getting the title. The surface conditions are similar to the veins on the Rosario property just over the hill on the Sinaloa side, which has been a dividend payer for 25 years and now is in 'chispa' ore.

At the Jesús Maria Anexas mine at San José de Gracia, one mile from the Rosario, M. A. Newman,

Piramida Mill and Offices, San Jose de Gracia, Sinaloa.

the manager, is finishing a complete modern 100-ton cyanide plant. This is one of the best gold mines in the State of Sinaloa. It is owned by Mexicans, two of whom are now in Paris; but it has able American management.

Near Yecorato, Mr. Deenlavy is working a gold property under bond and lease with satisfactory results. Above Minitas on a small arroyo some Milwaukee people installed a small dredge, to work the placer gold; but they are changing the machinery. Everything is quiet around Choix; the Lluvia de

Oro company expects to have its 100-ton plant completed and in operation within this year. Water for the mill will be raised from the Fuerte river, a distance of four miles, the difference in elevation being 3340 ft. On Babahuahua arroyo near the State line between Sinaloa and Sonora, Mexicans and a couple of Americans are taking out a little placer gold. At La Mina, near Villacetas, D. H. Livingston, manager for a Michigan company, is developing a large copper vein in lime. The sulphides have come in, and it looks favorable. Near Agua Caliente de Avila is a large copper prospect known as the Copper Iron King, with an iron gossan 150 to 250 ft. wide, showing copper ore assaying 2 to 5% on the surface with gold and silver.

At Aduana, near Alamos, the Quintera mine is still idle. This is owned by a French company, which has exhausted its reserves, and after paying dividends for years is now idle. The old Promontorio adjoining, which has produced high-grade silver ore through the last 200 years, after being idle for several years, has again commenced work under American ownership and management; there are hundreds of thousands of tons in the old dumps, much of which will pay to work now; there are trees 2½ ft. diam. growing on the old dumps.

Part of Northwestern Mexico.

To the south of the Promontorio there has recently been discovered the extension of the vein, with high silver content. To the north of the Quintera, James Hendry, manager for Chicago people, on the old Santo Domingo is continuing his policy of developing the mine before erecting a plant. A mile or more farther north, on the same vein, Mr. Yeager, manager of the Zamboni property, is completing a large up-to-date cyanide plant with Pachuca tanks. This mine has a large recorded production.

North of Mayo river, about 35 miles from Alamos, C. W. Smith, representing Chicago people, is developing a 70-ft. free-gold vein, and some smaller veins. He has a 10-stamp mill, and has made some preliminary mill-runs. He is installing a hoist on the large vein. At Baucari the Zeigler brothers are finishing the cyanidation of tailing from the old Baucari mine. Three years ago they bought them for ₱300, expecting there were only 3000 tons, but they have treated 12,000 tons, which were covered by the wash.

THE LLUVIA DE ORO MINE.

Written for the MINING AND SCIENTIFIC PRESS
By E. A. H. TAYS.

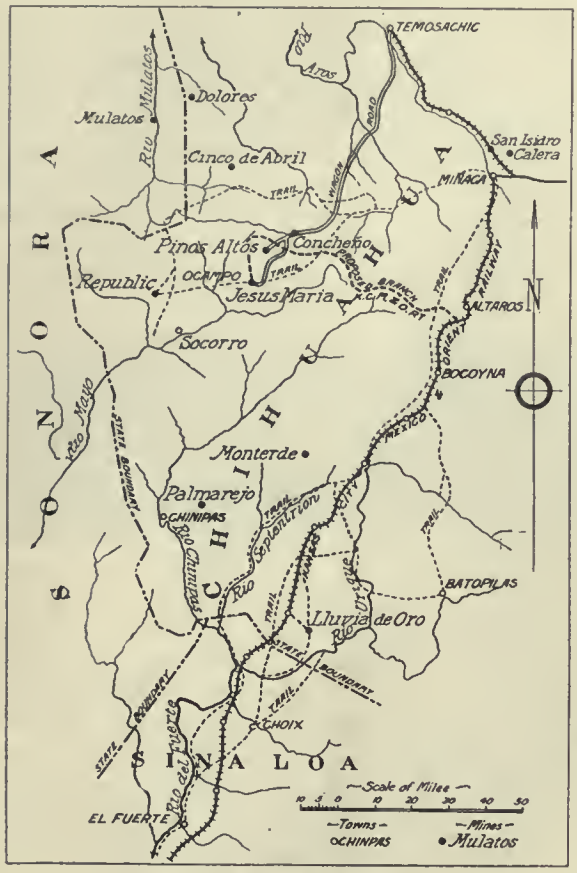
The Lluvia de Oro mine is probably one of the most unique geologically in the world. Its geographic position is almost exactly 108° longitude, west, and 27° north latitude; is almost due east from Alamos, Sonora, about 70 miles, and just over the Sinaloa line, in western Chihuahua, Mexico. The present, most practical route to this camp, after reaching Fuerte, Sinaloa, is by way of Choix, from which place it is about 40 miles distant to the northeast.

The mine itself is situated on a precipitous ridge lying between the Reforma arroyo to the north and the Fuerte river to the south. The elevation of the mine is probably 4200 ft., while the river, five miles to the south, is only about 1200 ft. above sea-level. This is one of the few orebodies that escaped the early Spaniard, who was an indefatigable prospector, it being discovered in 1900. I have seen several accounts of this discovery, but none quite agree with the one I have from the principals themselves. It was long suspected that there was a rich gold deposit in the vicinity, but years of prospecting failed to reveal it until one night a Mexican, an employee of Bernardo García, who lived at Realito, a small place on the Batopilas trail, on the river about 10 miles southeast of the mine, who found himself in a Tarahumari camp, during a drunken feast, overheard some of the Indians talking about a lode of rich ore from which they obtained gold. They described it so minutely that the man had little trouble in going to it the next day. He took some of the rock to his 'patron', Don Bernardo García, who denounced the ground at once. So rich were the samples that he gave the claim the appropriate name of 'Lluvia de Oro', or Shower of Gold.

What the Indians got out of the Bonanza was the beef of a bull, while the man who got the knowledge of the lode, thinking he owned the world, proceeded to spend everything in sight until Mr. García had to cut him off entirely. He is now a half demented pitiable object whose family Mr. García supports.

From the beginning Mr. García put such a stiff price on the prospect that no one cared to buy, or even take it on bond, and by the end of 1902 he had only developed the property to the extent of a 20-ft. shaft on the Cuatemoc side, and another 13 ft. deep, 10 by 29 ft., seemingly across the orebody, but in reality following it, as afterward shown. At that date he was asking $2,000,000 for the property, on almost impossible conditions, and though he had not $150,000 worth of ore blocked out, he was justified in a measure, for he had a little 3-stamp mill which he could run only four hours per 24, but his

clean-up every day yielded from 5 to 6 lb. of gold. At that time much of the ore not only showed free gold, but native silver also. Assays revealed a ratio of 10 oz. silver to each ounce of gold. The bullion, however, is high grade, as most of the silver is secured in the concentrate, which often assays 600 to 700 oz. per ton.



Map of Western Chihuahua.

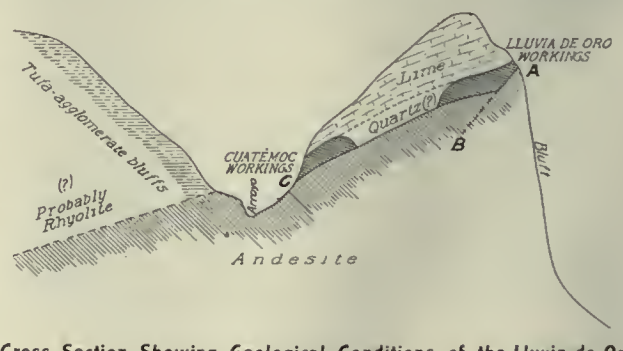
Finally, in 1903, Mr. García found parties, Americans of course, who took the property on his terms, and luckily, explorations justified the action. By January 1905 over $4,000,000 worth of ore was blocked for stoping, but the orebody had developed along unexpected lines. In 1902 it looked as though the vein ran north and south, with its dip to the west, the body apparently lying on a supposed foot-wall, A, B (see geological section), which is judged to be that of a fault-plane.

The geological conditions are unique. The orebody, for it is not a vein, outcrops on the east side of the ridge near the summit, and is here known as the Lluvia de Oro. On the west side it again outcrops near the gulch, and is there known as Cuatemoc. At first sight one is led to believe that the Lluvia body is a contact lode, but explorations have proved otherwise. The main formation in the vicinity is andesite, partly altered, and, for the most part, along the river five miles south, the formation is granite. South of the river the country rises in a series of granite ridges to a height of 5000 ft. 15 miles away, in the tufa-capped peak of Santa Gertrúdis. To the north the granite disappears under the andesite almost immediately, and the whole country consists of andesite up to the Lluvia de Oro mine, where there is a cap of limestone, probably Cretaceous, but the limestone here is simply an island, a remnant of an earlier formation, raised to over 4000 ft. in elevation during one of the periods when the world 'humped' its back and never got it down again. The remnants cap the peak, only a few acres in area.

Farther north are other bodies of limestone, out of place, near the top of the main east and west ridge. In one place, if my memory fails not, the lime rests on an andesite agglomerate. The bluffs to the west of the Cuatemoc are mostly a tufa agglomerate, resting on the andesite. Near the contact of the limestone with the andesite, at the Lluvia de Oro outcrop, the latter is fine-grained, greenish-blue in color, and is finely brecciated in spots. Here it is easily confounded with diorite, and has been so called, but this immediately blends into coarse porphyritic, unmistakable andesite.

Explorations have proved that the orebody at the Cuatemoc side does not go down, but that it does go up, following the lime along the contact on an angle of perhaps 20°. The Cuatemoc explorations have developed large bodies of ore, some of it of phenomenal richness. In sinking on the Lluvia de Oro it was found that the ore, in the lime, followed the plane B C, practically the line of contact. This, for the first 20 ft., took the dip A B, but from there on flattened, becoming almost level for a considerable distance. Here, also, large bodies of ore have been blocked out, most of it being high grade. Here the gangue is quartz, seemingly a replacement of the lime. The main body is about 60 ft. wide, dipping toward the Cuatemoc workings. About 50 ft. to the north of this another 50-ft. body of ore has been found, but not as rich ore as the original mass. Explorations have been carried northward on a level along the contact, with the dip of A B for quite a distance, but I understand no new orebody has been found.

The sketch is not drawn to scale, but simply gives an idea of conditions on the contact, that is approximately correctly proportioned. From the work done



Cross-Section Showing Geological Conditions of the Lluvia de Oro Orebody, Chihuahua, Mexico.

it would seem that probabilities were still favorable for finding more ore, and I have learned recently that new orebodies have been found, and much of it extremely rich. So far no vein, in the andesite, directly connected with the orebodies in the limestone, have been found, although there are several well defined veins outside of the limestone rim. That the present quartz orebodies are replacements of the lime is evident. After several years of preparatory work that would have swamped an ordinary mine, this property is about to become productive.

TIN IN 1909.

Written for the MINING AND SCIENTIFIC PRESS
By H. W. TURNER.

The price of metallic tin per pound in New York gradually increased from 28 cents in January to 32 cents in December. The total yearly output of the world has exceeded 100,000 short tons of metallic tin for several years. From the reported production up to September, it seems likely that the output for 1909 will be somewhat less than in 1908, when it was 116,648 short tons, according to the estimates of the United States Geological Survey. In the Malay peninsula, the old method of washing the tin-bearing gravels is still mostly in use, but in Kelantan, Siam, dredges are in operation, as also in Australia and other places. While the bulk of the tin still comes from alluvial deposits, lode-mining in Cornwall, Queensland, Tasmania, Bolivia, and South Africa adds an increasingly important quota.

Tin is found in nature chiefly as cassiterite, an oxide of tin, frequently accompanied by tourmaline, fluorite, wolframite, topaz, and the sulphides of iron, copper, and arsenic, and sometimes bismuth. Cassiterite is usually in or near acid igneous rocks (granite and quartz-porphyry) and is regarded as originating from solutions and gases emanating from the granite and porphyry magmas. However, it has been found as an original constituent of granite in Germany, and Winkler has shown that many granites and hornfels contain tin not as cassiterite, but chemically combined with silicates. Sandberger has found tin in muscovite, a potash mica, and Verbeek describes a tin-bearing silicious sinter from a hot spring at Malacca in the Malay Federated States, which contains 0.5% of tin, showing that ordinary thermal waters may hold tin in solution.

United States. In South Carolina, near Gaffney, and near Kings Mountain, in North Carolina, tin has been mined in recent years and shipped to England for smelting. Extensive operations have been conducted in the Black Hills of South Dakota, but not with good results. The cassiterite is there found in pegmatite dikes. The Harney Peak Tin Mining, Milling & Manufacturing Co., of South Dakota, has recently commenced active prospecting on some of its numerous claims after a long period of litigation, and the Tinton Milling Co. of Tinton, South Dakota, is reported to have started its 150-ton mill, which is equipped with Gates crushers, shaking screens, Wilfley tables, and a Callow cone, followed by a Wilfley slime-table.

In Texas, the deposits in the Franklin mountains, north of El Paso, are being developed. The tin ore occurs in veins in granite. Cassiterite is also reported from Streeter, Mason county, both as stream tin, and in place in granite. Two adits are being driven to reach the veins in depth. So far seven cassiterite-bearing veins have been found and partly stripped. The mineralized zone in the granite is said to be about one mile wide, and within this space, float ore shows that other veins have not yet been found. The longest vein has been traced up a granite hill for 1000 ft. and is cut at the upper end by a diabase dike.

In Washington is a cassiterite deposit in pegmatite at Silver Hill, southeast of Spokane, which, however, was not being developed in 1908. At Chelan butte, Okanogan county, 60% ore is reported on the mine dumps.

In Alaska, from the western end of the Seward Peninsula, near Cape York, about 160 tons of cassiterite were extracted from gravel from 1902 to 1908, inclusive. These alluvial deposits in places contain from 8 to 27 lb. of 60% ore per cubic yard. The ore also occurs in place in lodes in altered quartz-porphyry dikes; along the contact of granite and limestone; in quartz veins cutting limestone and granite; and in actinolite-rock. The deposits, according to Knopf, warrant future cautious prospecting. The geology is described by Knopf,[1] and the tin ores are ascribed to emanations from the granite and quartz-porphyry magmas. According to Collier, one mineralized dike of granite-porphyry in Silurian limestone, on Lost river, shows cassiterite, tourmaline, galena, garnet, and lithia mica, and a piece on assay showed gold to the value of 0.36 oz. per ton. Knopf found 22.9 oz. of silver in the average ore of another tin and galena-bearing dike in the same locality.

Mexico. In acid lavas (rhyolite, etc.) in Mexico, tin oxide has been found and mined at a number of localities. It occurs in Baja California, Durango, Zacatecas, Jalisco, Querétaro, Guanajuato, and San Luis Potosí. It is reported that tin mines have recently been acquired by Americans in Aguascalientes, and that tin has been found recently in Coahuila, opposite Boquillas, Texas. No important deposits have thus far been discovered in Mexico.

Bolivia. The extensive lode deposits of Bolivia produced from 1884 to 1908, inclusive, about 166,000 long tons of metallic tin. The principal district is the State of Oruro, but important deposits are likewise found in the adjoining States of La Paz and Potosí. According to Minchin at Huanuni in La Paz and Avicaya, in Oruro, some of the lodes are still rich at a depth of 1000 to 1300 ft. Rumbold[2] describes in detail certain of the tin lodes of Oruro, showing them to be confined chiefly to quartz-schists, probably of Devonian age, which are intersected by quartz-porphyry dikes, also tin bearing. It had formerly been held that these deposits were, at least in part, in the overlying lavas, and that the Bolivian deposits were unlike those of other portions of the world. Rumbold shows that the lodes contain much tourmaline, with sulphides of copper, iron, lead, zinc, and bismuth. The origin of the ores is ascribed to emanations from the intrusive quartz-porphyry and granite magmas. The Bolivian tin mines are now chiefly in the hands of Chileans, are badly managed, and are over-valued.

England. In Cornwall, the rich gravels have long been exhausted, but the production from lodes is still important, about 6500 tons of black tin having been produced in 1908. From 1884 to 1893, inclusive, Cornwall produced about 100,000 tons of metallic tin. The new shaft of the Dolcoath mine is now down about 2600 ft. During the first six months of 1909, 45,880 tons of ore were hoisted, from which over 2% of black tin was recovered. The Botallack, Wheal Kitty, Penhalls, Carn Brea & Tincroft, and

[1] *Econ. Geol.*, IV, 214-223. [2] Ibid, 231-364.

other mines, are operating. H. W. Hutchin[3] treats of ore dressing at the South Crofty mine, where California stamps are used for crushing, and Buss tables for concentration. It is also interesting to note the use of American machinery in the Clitters mill, where Frue vanners and Wilfley tables are installed. At the Dolcoath mine, the Elmore vacuum process is said to be effectively separating the sulphides from the black tin. Levy and Ewen[4] experimented on the recovery of tin and arsenic from 'hard-head' which is a sulph-arsenide of tin and iron, a smelter product, by bessemerizing. It was found possible to convert hard-head into a highly ferruginous slag, and a fume consisting to a large extent of arsenic oxide with some tin oxide. As hard-head commands a fair price for smelting lead and antimony ores, it is doubtful if bessemerizing will pay.

Europe. Tin ore is produced in relatively small amounts in Austria, Germany, Spain, Portugal, and Russia.

South Africa. In at least five regions in South Africa, workable tin deposits have been found, the most important being the new Waterberg district in the Transvaal. Ore is likewise found on the Knils river near Cape Town, and in Bushveld and Swaziland in the Transvaal, as well as in Zululand. The Waterberg mines produced in the year ending June 30, 1909, ore to the value of $748,686. The deposits occur along a well defined granite belt, in granite, felsite, and quartzite, the richest being in the granite. In addition, there are workable alluvial deposits. Concentration mills have been erected.

West Africa. Nigeria has long been known as a tin-producing State, and the natives have mined the gravels and smelted the concentrate. The tinfields are in the Bauchi province. In 1908, 500 tons of concentrate was shipped. The Nigeria Tin Corporation was formed in London in December 1909 to work these deposits.

Australia. In the past, the chief production has come from the gravels of New South Wales, but Queensland is now the larger producer, the tin coming chiefly from lode-deposits. From 1872 to 1894 inclusive, New South Wales produced about 120,000 tons of metallic tin. The gravels are now worked in part by dredging, and in addition there is a small amount of ore mined from lodes. In Queensland, the product, from 1872 to 1892, inclusive, was about 74,500 long tons of metallic tin. In 1908, Queensland produced 5404 tons of black tin. The lode of the Vulcan mine at Irvinebank is a cylindrical pipe 10 to 20 ft. diam. The shaft is now down 1440 ft., and stoping is in progress on the 1220-ft. level. Some tin is also mined in Victoria and in Southern and Western Australia.

In Tasmania, the chief deposits are those at Mt. Bischoff, where the ore is found in veins in quartzite and slate, and in dikes of quartz-porphyry, so that the occurence is similar to that in Bolivia. About 88,000 long tons of tin were produced from 1873 to 1899, inclusive. The Mt. Bischoff company has its smelting plant at Launceston, Tasmania. At the tin, bismuth, and wolfram mines, near Sheffield, 500 to 600 tons per month of lode-material is treated. At Mutual hill, stripping of alluvial deposits is in progress. Placer tin is also being mined at Cascade river. A new tin deposit is reported from Scamander river, St. Helens.

Malay Peninsula. The Malay peninsula, and the islands of Banca and Billiton, have for many years supplied the bulk of the tin of the world, chiefly from alluvial deposits. Lodes containing cassiterite have been found in granite and limestone in these regions, and mined to some extent in Perak and Pahang. The Malay Federated States in 1908 produced nearly 57,000 short tons of metallic tin. Judging from the output up to September, 1909, the output in 1909 will be nearer 50,000 short tons. Of these States, Perak is the most prolific. This State produced from 1874 to 1893, inclusive, 199,104 short tons of metallic tin. Chinese do most of the mining, and formerly much of the ore was locally smelted by them. Salangpore produced from 1878 to 1891 about 76,000 long tons of metallic tin, and Sungei Ujong and Pahang are also important producers.

The island of Banca produced 68,388 long tons of metallic tin from 1880 to 1894, inclusive, and Billiton 64,695 long tons from 1880 to 1893, inclusive. The islands of Sinkep, Sumatra, and Carrimon are relatively small producers.

From the Siamese States of Bantaphan, Chomphom, and Faungswan about 25,000 short tons of metallic tin were produced from 1887 to 1891, inclusive. The bulk of the ore is sent to Penang and Singapore for smelting and refining. Smelting costs from $25.20 to $33.60 per ton of black tin, according to the grade of the ore, in 1890. Tin is also produced in the Mergui district in Burma. In southern China, in the province of Yunnan, there is an important production of tin, but it is chiefly consumed in China, and not much is known of the deposits.

Recovery of Tin.—In the United States and Germany, a large amount of tin is recovered from tin scrap, type metal, and other sources. The amount recovered in 1908, in the United States, is given by the Geological Survey as 2790 tons, worth $1,641,476.

At the Rooiberg mill, where the ores vary greatly, provision is made for preliminary sorting and coarse concentration. The ore is reduced in a rock-breaker to 1½-in. size, elevated, and passed over grizzlies. The undersize drops into the mill-bin and the oversize is washed and sorted on a traveling belt which delivers the sorted ore to the mill-bin. Mechanical feeders supply the 10-stamp mill where it is crushed to 10-mesh. The stamps weigh 1050 lb. The battery pulp is elevated, unwatered to a certain extent by a Callow tank, and the pulp passed on to Callow screens, where the separation of the pulp above and below 20-mesh takes place. The oversize is treated in a 3-compartment Harz jig, and the undersize passes through a classifier which separates the pulp suitable for treatment on Wilfley tables from the slime. The latter is thickened in four Callow tanks and then treated on Frue vanners. The middling from the jigs and from the Wilfley tables is reground in a Holman pan and the re-ground material joins the pulp flowing into the classifiers. Sorted ore to the amount of 1100 tons yielded 75 tons of 70% concentrate, or 4.77% of metallic tin.

COPPER DEPOSITS OF PRINCE WILLIAM SOUND, ALASKA.

Written for the MINING AND SCIENTIFIC PRESS
*By U. S. GRANT.

Prince William sound is an embayment extending northward from near the centre of the north side of the Gulf of Alaska, lying west of the Copper river and east of Cook inlet. The sound is not a sound according to the common usage of that term, but is an extensive bay with many islands and deep arms, some of which are in the nature of fiords and contain glaciers reaching to tidewater. High mountains surround the district on the east, north, and west, and to some extent on the south. The principal towns are Valdez and Cordova, the latter of which is the tide-water terminus of the Copper River railway.

Prince William Sound and Eastern Part of Kenai Peninsula, Alaska.

Copper prospecting on Prince William sound dates back probably to the Russian occupation of Alaska, but no serious work was done until the discovery of the Gladhaugh claim (now the Ellamar mine) on the northeastern shore of the sound (see accompanying map) in 1897. The Bonanza mine, on Latouche island, was staked later in the same year. From 1897 to the present time prospecting for copper has been active, and was especially active from 1903 to 1907. The two mines mentioned above are the only ones which have made regular shipments of ore, although small shipments have been made from certain other properties. The ore goes to the Tacoma smelter.

The sedimentary rocks of Prince William sound are separable into two divisions, known as the Valdez and Orca groups. The former is the older and outcrops along the northern part of the sound. The rocks of the Valdez group are slates and graywackes. The Orca group lies unconformably on the Valdez rocks and occurs especially on the eastern and southern shores of the sound and on the islands of the central part of the sound. The Orca rocks consist essentially of slates and graywackes, which are less crystalline than those of the Valdez group, and greenstones. The greenstones are to a large extent altered basic lava flows with which are some dikes and probably also some intrusive sheets. The greenstones frequently have the ellipsoidal structure which is so common in the greenstones of the Lake Superior iron districts. Most of the ore deposits occur in or close to these greenstones, and where these rocks occur prospects are common. The most important prospects are about Orca, on Port Fidalgo, on Landlocked, Boulder, and Galena bays near Copper Mountain, and on Glacier, Knight, and Latouche islands. A belt of these greenstones occurs on the east side of Resurrection bay, southeast of Seward, and some prospecting for copper has been done there. Granites, intrusive into both the Valdez and Orca rocks occur, but bear no relation to the orebodies.

Chalcopyrite is by all means the most important copper-bearing mineral on Prince William sound. It occurs in practically all the mines and prospects and is the mineral which forms the ore of all the shipments. The chalcopyrite is usually intimately mixed with pyrrhotite, which in itself carries probably a little copper sulphide as an impurity. These two minerals, chalcopyrite and pyrrhotite, are closely associated and the relative proportions of the two vary greatly, even in the same deposit. Pyrite, also probably carrying a little copper, occurs in some places, and chalcocite has been found in at least one

*Published by permission of the Director of the United States Geological Survey.

prospect, and original native copper has been reported from another. Secondary copper minerals are of small importance, as weathering has extended only a short distance below the surface, but malachite, azurite, covellite, and native copper occur in small amounts. The other metallic minerals in the ore deposits are galena, sphalerite, and magnetite, but these are unimportant. The associated non-metallic minerals are quartz, calcite, epidote, and chlorite.

The copper deposits occur in zones along which there has been fracturing and usually shearing of the country rock. Many of the deposits are clearly in shear zones in which it is possible to distinguish two parts; first a more or less solid layer of metallic sulphides, and second the rest of the zone which has been only partly impregnated by these sulphides. The solid layer is the most important part of the zone and has a tendency to swell and pinch, sometimes disappearing entirely. The thickness of the solid sulphide layer varies from a fraction of an inch up to several feet, but at most of the prospects thicknesses

The Ellamar Mine, Ellamar, Prince William Sound, Alaska.

of over 5 ft. are not common. The ore in such layers varies from almost pure pyrrhotite to almost pure chalcopyrite. Assays of these layers show copper running up to 25 and 28%, but the average is considerably lower than this. The sheared rock outside of this solid sulphide layers varies largely in width and in copper content. In some zones there are several feet of this rock, but as a rule it does not carry high enough percentages of copper to pay for working under present conditions. These shear zones occur mainly in the greenstones and in some places follow closely the contact of the greenstones with the adjoining sediments. An exception to this statement should be made for the deposits at the Bonanza mine on Latouche island, where the country rock is slate and graywacke and where no greenstone is known close to the ore deposit. In addition to the ore deposits occurring in shear zones, there are a few lens-shaped bodies of considerable size. The best known of these is the orebody at the Ellamar mine. Another occurs near the eastern shore of Knight island, and another on Latouche island. In a few localities chalcopyrite and pyrrhotite are disseminated in basic igneous rocks, such as gabbro and diabase. Near Orca the country rock is a much-crushed, reddish, amygdaloidal basalt with irregular stringers of epidotized rock. The basalt has been fractured and contains irregular vein-like forms. The ore minerals at this place are chalcocite and native copper, sometimes occurring in amygdules.

Positive conclusions as to the origin of the ore deposits are not warranted by the information at hand. The close association of the deposits with the greenstones points to these rocks as a probable source of the ore minerals. The deposits are, however, clearly of later date than the solidification of these rocks, and the shear zones in which the ores occur are as late or later than the folding of the country rocks. If there are other basic rocks later than, or contemporary with the folding and fracturing, they are not always clearly recognizable; yet in a few cases basic dikes are known which do not seem to have been affected by the folding of the district. That the ores originated from basic igneous rocks seems clear, but whether from magmatic waters derived from rocks later than the greenstones, or from ground waters acting on these greenstones, is not so clear. The decrease in thickness of the ore deposits in depth, at least as far as present information would lead one to conclude, points to the fact that the deposits are in the main in the nature of secondary enrichments. Such enrichments by downward moving waters probably took place before the district was glaciated. During glaciation the upper leached parts of the deposits, as well as some of the enriched portions, were removed.

The two most important deposits known in the district are that of the Ellamar mine and that of the Bonanza mine. The former consists in a lens-shaped body of ore (chalcopyrite and pyrrhotite in varying proportions) which outcrop between tides. The maximum length of the major axis of this orebody, on the 200-ft. level, is approximately 190 ft., and the maximum minor axis is 80 ft. The strike of the major axis is approximately N. 35° W. The dip is very steep—80 to 90°—toward the northeast, and the pitch is about 35° toward the southeast. This orebody has been opened upon the 100, 200, 300, 400, and 500-ft. levels and is reported to have pinched out before reaching the 600-ft. level. The Bonanza mine is near the northwest side of Latouche island and about a half mile back from tidewater. The orebody outcrops on the face of a steep hill and the mining up to date has consisted mainly in quarrying the rock from the face of this cliff. Mining has also been done in an adit about 30 ft. below the floor of this quarry, and recently considerable exploratory work has been carried on in drifts 90 ft. still lower. The ore consists of chalcopyrite which fills fractures in and also impregnates the country rock, which in this vicinity is slate and graywacke. But at the mine and holding much of the ore is a peculiar hard, fine-grained, gray to greenish rock whose exact nature is not clear. The orebody is nearly vertical and strikes northeast and southwest. Many of the prospects are on or close to tidewater, so that ore can be easily shipped.

QUARTZ MINING IN YUKON TERRITORY.

Written for the MINING AND SCIENTIFIC PRESS
By GUY A. R. LEWINGTON.

The Lone Star quartz mine has been brought to the point of production by William Catto, president, and F. R. Chute, vice-president, with a board of directors composed of prominent business men of Dawson. This is of vital interest to the whole Yukon Territory as it is the first step to a more permanent camp. The workings are situated at the head of Victoria gulch, a tributary of Bonanza creek. Victoria gulch is the up-stream end of the placer gold on Bonanza creek, and as the gulch is rich in gold from its mouth to its source it is generally believed that the Lone Star vein was an important source of the supply of placer gold on Bonanza and on Eldorado creeks. An extension of the lode cuts the latter creek well up toward the end of discovered pay.

The lode was located nine or ten years ago, and has always been considered valuable, but unfortunately litigation has prevented its development. The deposit has been described by R. G. McConnell, of the Canadian Geological Survey, as a stockwork paralleling a fissure vein. The hanging wall consists of contorted schist, and the apparent foot-wall is made up of solid gray schist, possibly an altered porphyry. Lying next to the foot-wall is a lode of quartz 4 ft. wide. Between this and the hanging wall there is a body of blue clay fully 10 ft. wide on the surface, containing a large percentage of iron pyrite of undetermined value. The trend of the lode is north and south. The stockwork before mentioned is cross-cut by this fissure at an angle of about 45°; showing the fissure to be a newer deposit. It consists of contorted ribbon rock, containing a fair amount of gold, and dips slightly toward the hanging wall of the fissure. This older deposit has been traced for a distance of 400 ft. in length; its width has not been determined. An open-cut has been run on this deposit at a depth of 20 ft. along its general course. This cut shows a stockwork of schist and quartz veins more or less parallel. The trend is southeast. The north and south fissure has been definitely traced for a distance of 1500 ft. For this distance it carries its width of 4 ft. The clay is also found to continue and maintain its character for this distance. The vein for its whole determined length shows free gold which may be obtained by panning. Twenty tons crushed some years ago as a test, gave $407 gold, and the many samples taken would indicate its value to be from $17.50 to $20 per ton free gold. Whatever gold is contained in the concentrate must be added to this. The clay carries small amounts of free gold. The pyrite, of which there is a large percentage, has not yet been properly tested, but is known to be valuable.

Two shafts, one 40 and the other 50 ft. deep have been sunk on the vein. These show the ore to be of the same width, character, and value as on the surface. An adit has also been started at a point which will tap the lode at a depth of 100 ft., in a distance of 210 ft.; this will be used as a drain for the first level, and also for taking out the rock. Toward the end of the season a mill-run of 410 hours was made on rock from the stockwork or older deposit, 100 tons of unselected rock being crushed, returning $1334. During the last 30 hours of this run an amalgam trap was used, recovering 3½ oz. of amalgam, leading those in charge to believe gold had been lost before.

The equipment consists of a 2-stamp Hendy mill placed 200 ft. below the level of the open-cut and about 300 ft. distant, a Challenge ore-feeder, Blake crusher and ore-bins, 30-hp. steam boiler, and 20-hp. horizontal engine, a dynamo and all necessary tools, 3000 ft. of rails, a gravity tram, and self-dumping cars which discharge directly into the ore-bins. All necessary buildings have been put up in a substantial manner. It is expected that the mill will be enlarged just as soon as the orebody has been definitely traced and its value established. The small plant now at work will keep development going.

Open-Cut, Lone Star Mine.

Development work is also well under way on the property of the Dome Quartz Mining Co. This mine is situated on a divide between Lombard and Dominion creeks, and is owned principally by Hartman and Davidson. During the latter part of last winter an adit was started for the purpose of cutting the lodes, of which there are five, at a depth of 600 ft. below the outcrop. This adit has always seemed an ill-advised undertaking, on account of the risk and cost. However, nothing succeeds like success. It is now in about 1000 ft. and has tapped two of the veins which are found to show their full width and value. The other three veins, it is hoped, will be cross-cut some time next year. This will require about 500 ft. of additional driving. The property is generally believed to be of value. The cross-cutting of two lodes at a depth of 600 ft. and the finding of 3 ft. of ore in each vein with gold that will certainly pay, places the property in a most enviable position, and is a matter of great satisfaction to all concerned.

MINING IN NEVADA FOR 1909.

Written for the Mining and Scientific Press
By Jay A. Carpenter.

Despite the dull times over the State due to lack of capital for the extensive prospecting and development work of former years, the metal output of 1909 marks it as a banner year. The extraordinary increased production of gold and copper has caused the total value of the metals produeed during the year to exceed $27,000,000; a figure almost double that of 1908. Of this amount Esmeralda county produced over 12 millions, White Pine and Nye counties 6 and 5 millions respectively, Storey and Eureka about 1 million apiece. No county failed to add its quota. The great increase in gold production is in the main due to the continuous operation since early in January of the new 100-stamp mill of the

Map of Nevada.

Goldfield Consolidated. The Florence mill at Goldfield and the 100-stamp mill of the Pittsburg Silver Peak Mining Co. at Blair also have maintained a high bullion output. The camp of Round Mountain has shown a marked improvement, and a feature of the year is the revival of the Rhyolite-Bullfrog district due mainly to the discovery of the Pioneer with its rapid and successful development, and to the Montgomery-Shoshone which, noted as "comparatively a failure" in last year's review, faces the new year with a debt of $275,000 paid, large ore reserves blocked, and 25% increased milling capacity. The new gold camps of the year of note are National, near the Idaho line, with a production of about $250,000; and Bannock, near Battle Mountain, credited with $100,000 from surface workings in three months. Rawhide has made a production in the neighborhood of half a million, but its future depends upon its low-grade milling ores. The present gophering for high-grade ore and the building of small experimental mills is not encouraging. Manhattan, Seven Troughs, and Chaffey have made little or no improvement, while the mills of the Homestake King at Rhyolite and the Bamberger mine at Delamar have closed down under unfavorable conditions.

The silver production of the State has been maintained mainly by the mines of Tonopah. The 200 stamps of the Tonopah Mining, Tonopah Belmont, and the Montana Tonopah have dropped almost continuously during the year, and the MacNamara, West End, and Midway have shipped steadily to the smelters. Although the question of profitable orebodies on the deeper levels remains unsolved, the progressive development of the Tonopah Mining and Tonopah Belmont is highly commendable. Of especial note for the year is the exeellent work of the Montana Tonopah in paying off its large indebtedness, the paying of dividends by the MacNamara, the ereeting of a 30-stamp mill by the Tonopah Extension, and the development of new orebodies in the westerly claims of the Tonopah Mining Co. The old bonanza silver camp of Virginia City has more men working than for years past. The greater footage of exploration work has already shown good results in the Crown Point, Ophir, and Mexican. The large open-cut on the Chollar croppings on Potosi ground by Charles Butters, though hardly profitable on such a large scale, is a tribute to his energetic methods. The year has marked the completion of the wooden stave drainage pipe through the main Sutro Tunnel, which gives the mines, with shafts long since abandoned, an easy and cheap method of handling their rock. The Sutro mill has been kept busy of late on ore from these properties. The old camp of Eureka has also prospered, taxing the rolling stock of the railroad with ore to the Utah smelters. Pioche, until the Tintic smelter closed, made steady shipments of low-grade ore. Austin, Wonder, and Fairview districts have had a quiet year.

The past year marks the entrance of Nevada among the large copper producing States as a result of the starting of the Steptoe concentrating and smelting plants of the Nevada Consolidated and Cumberland-Ely mines. Through steady construction work the January output of 2½ million pounds was more than doubled in the closing months of the year, and at a cost of production given at 7c. per lb. The Giroux promises to be rapidly brought to the producing stage by the Cole-Ryan interests. The copper mines of the Yerington district in Lyon county have been developed to such a stage as to warrant the building of the Copper Belt railroad with plans for the erection of smelters.

Except for the strike at the Veteran mine at Ely, the labor conditions over the State have been a pleasing contrast to the stormy days in 1907. The bullion

tax suits have been peacefully settled and whatever may be said of the justice of this tax, that has amounted to $250,000 for the year, or of the methods of the bullion tax collector the commendable results are being obtained. The outcome of the injunction suits brought by Goldfield mining companies to prevent the buying of high grade by local assay offices will be followed with interest by mining men. In the mines the year's record was marred by the caving of the Hampton stope at Goldfield with its loss of life, and by the fire in the Sutro Tunnel at Virginia City which threatened to flood the mines through the choking of the tunnel by caving debris and which was conquered only by the sheer grit and heroic efforts of the Virginia miners. The pumping situation at the Ward shaft at Virginia City is not far ahead of where it was a year ago because of the failure of the newly installed express pump under the trying temperature conditions. The new management plans to cope with the situation by using simpler pumping units of quintuplex vertical-plunger pumps geared direct to two-speed motors and with modifications in construction to meet the special conditions—these to be placed in units at different levels

Ward Shaft.

to avoid the dangers and difficulties that beset one large pump placed on the lowest level.

In mining progress for the year is to be noted the extensive use of the churn-drill and steam-shovel at Ely, the use of the diamond-drill at Ely and Tonopah, and the rapid increase in the use of the air-hammer drill. In metallurgical progress there is to be noted the erection of the large modern copper concentrating and smelting plants at Ely; the installation of Chilean mills behind stamps or rolls at the Goldfield Consolidated, Round Mountain, and Montgomery-Shoshone mills, instead of Huntingtons as in the earlier Tonopah mills to increase the milling capacity; the substitution of blankets and carpeting at the Goldfield Consolidated and Florence mills for amalgamating plates; and the general tendency for greater aeration in the agitation of slime either by air alone, as in the Consolidated mill, or by air and mechanical agitation together as in the Trent agitators at the Montgomery-Shoshone. An index to the sound basis of the mining industry of the State is the extension of the Bishop power lines into Round Mountain and Manhattan with plans for a 100,000-volt line to Ely, the increased tonnage and earnings of the Nevada railway lines, and the proposed road from Ely to Goldfield.

DREDGING IN MONTANA AND IDAHO.

Written for the MINING AND SCIENTIFIC PRESS
By W. A. SCOTT.

The most important gold dredging operations in Montana are at Ruby, in Madison county, where Alder gulch opens into Ruby valley and spreads its auriferous gravel and sand over an area of many hundred acres in the valley named. Alder gulch, on which Virginia City is situated, was the most productive of the placer diggings of the State from 1864 to 1875, and, when at the height of its prosperity, had a population of 50,000. The branch line of the Northern Pacific railroad, that extends from Whitehall up Ruby valley, terminates at Alder station. The distance from this station to the mouth of Alder gulch is about four miles; and extending from the mouth of this gulch nearly to Alder station is the large area of dredgeable ground belonging to the Conrey Placer Mining Co., whose operating headquarters are at the little town of Ruby, situated adjacent to the tract; this company's holdings also extend up Alder gulch to Adobetown. The most of the stock of the Conrey company is owned in Boston, New York, and Washington, Harvard University holding one of the largest interests, which came to that institution as a bequest from Gordon McKay, a manufacturer at Newport, Rhode Island. A. H. Wiseman, former manager for the company, who prepared an article on this dredging field, is authority for the statement that N. S. Shaler was responsible for tests which proved the portion of Ruby valley that receives the wash from Alder gulch, to be profitable dredging ground. This was in 1898. After various attempts at dredging, first with Orange Peel excavators, then with various types of steam dredges, the actually successful work began in September, 1906, when the Conrey company's No. 3 dredge was put in operation. Dredges No. 1 and No. 2 were built in 1908, No. 1 having started work in May and No. 2 in June of that year. The three dredges are operated by electric power from the plant of the Madison River Power Co., in Madison canyon, 50 miles east. A transmission line connects with the Conrey company's sub-station and transformers at Ruby. The three dredges have a combined capacity of 350,000 cu. yd. per month, based on actual operations. No. 3 was designed by company engineers. Its hull is 138 ft. long, 48 ft. wide, and has the mooring-line system of anchorage. The digging chain has a length of 96 ft., carrying forty-two 13-cu. ft. buckets, open-connected, operated by a 150-hp. electric motor, the speed of the buckets being 8 ft. per minute. The dredge is swung from side to side by a 10-hp. motor, direct connected to a winch; a 30-hp. motor connected to a massive winch serves to move the dredge under its mooring lines. The revolving screen is 18 ft. long, 61 in. diameter, and has equally spaced 4 by 6-in. holes through which the smaller material passes into the sluiceway on the upper deck. In this 90% of the gold recovered is saved. The oversize from the screen passes out at the end, thence through rock-chutes into the pond. The screen is revolved by a 10-hp. motor. The necessary water for the screen and

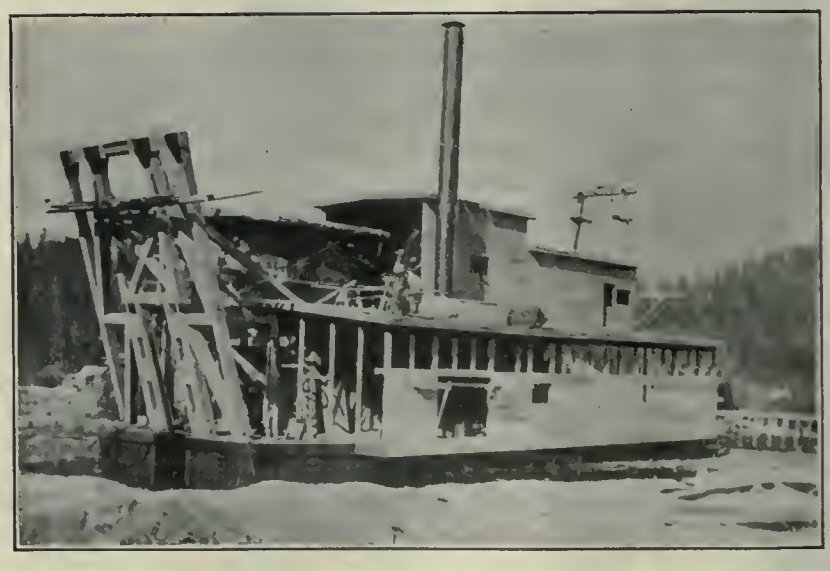
sluiceway is pumped by three electrically driven pumps which lift 12,500 gal. per minute. The material passes from the upper sluiceway into a 135-ft. tail flume, 66 in. wide, lined with angle-iron riffles, discharging the tailing evenly on the worked over area. Below the tail flume are two under-current flumes, each 50 ft. long, 12 in. wide, discharging upon a plate 5½ ft. square, having ¼-in. perforations, through which the material passes to a riffled table below. The main part of the boat is heated by two Hart & Crouse hot-air furnaces, and a steam-boiler radiates heat through a system of pipes to other essential parts. The ground in which No. 3 dredge operates is from 34 to 40 ft. deep, the buckets cutting from 1 to 4 ft. into the bedrock. The gold in this ground is said to be quite uniform from surface to bedrock. This dredge worked 34 acres in 20 months to an average depth of 34 feet.

Dredge at Ruby, Montana, Built by Marion Steam Shovel Company.

Dredges No. 2 and No. 1 were built by the Marion Steam Shovel Co., and are of the stacker type, and use spuds. No. 2 operates in ground half a mile nearer the mouth of the gulch than does No. 3, the latter being farther down in the valley. No. 2 has thirty-six 10-cu. ft. buckets, open-connected, on a 76-ft. ladder, the material being dumped from the buckets into a hopper, from which it passes through a revolving screen 35½ ft. long, 6 ft. diam. at one end and 4½ ft. at the other, the screen having ⅜ and ½-in. perforations, through which the finer material carrying most of the gold, passes to pans and tables lined with angle-iron riffles. There are 10 of these on either side of the screen, each 18 ft. long, 30 in. wide, all emptying into sluice-boxes which carry the gravel and water to the stern of the boat, where they fall into the pond; the oversize from the screen passes to a belt-conveyor which carries it to the stacker. The gold which is caught in the riffles is cleaned up weekly. The water for screening and sluicing is supplied by one 8-in. and one 12-in pump, electrically driven. The wooden spud, for use in stepping or moving ahead, is 48 ft. long, 24 by 36 inches in size. The steel spud, which rests in the ground while digging, is of the same dimensions; it acts as a pivot from which to swing the bow of the boat sidewise, and to hold the boat up to its work.

No. 1 dredge operates in 24-ft. ground, up Alder gulch, 2½ miles east of Ruby. It has 8-cu. ft. buckets, close-connected; in other respects it is the same as No. 1, in each boat the hull being 96 ft. long, 44 ft. wide, the lower deck being 50 ft. wide. The stacker on each boat is housed and the heating system is complete; all three dredges operate through the winter season as well as during other seasons of the year. The electric voltage received over the transmission line at Ruby is 46,000, which is transformed down to 2200 volts at the Conrey company's sub-station. Charles Kammerer, well known to dredge operators, is general manager; T. D. Prier, assistant manager and engineer. Hennen Jennings is the company's consulting engineer.

The Kansas City Commercial Co. purchased, within the last two years, the La Casse placer grounds situated on Cedar creek, 18 miles from Iron Mountain, in the western part of Missoula county. Since making the purchase this company has installed an electric-power plant, built a dredge, and began operating late in November, 1909. La Casse Bros., of Missoula, who sold the property, had built two 4-ft. flumes and had operated on a part of the ground in recent years with two hydraulic giants. The dredgeable part of the ground has been tested and the out-



New York Engineering Co. Dredge Being Built.

look for next season's work is favorable. Efforts will be made to operate during the winter.

Dredging operations at Pierce, Nez Perce county, Idaho, are in the hands of the Idaho Company, Ltd., which has 450 acres of placer ground at and close to the confluence of Oro Fino, Rhodes, and Canal creeks. About 250 acres of this is capable of being successfully dredged. This material has an average depth of 13½ ft., and lies on a bedrock of decomposed granite, about one foot of which is taken up by the buckets. Approximately 80% of this dredgeable material consists of tailing resulting from former placer operations. It is said to have sampled 21c. per cu. yd., and the recovery of gold does not fall far short of this figure. The reported estimate of the cost of operating is 8c. per yd. Much of this ground had been worked over twice before this company acquired it. The company has a Risdon dredge, with 3¼-cu. ft. buckets, which has just finished its fourth season of operation, having maintained, it is reported, a capacity of 1000 cu. yd. per day, and having operated 10 months of each year since work began.

The second dredge, finished and put in operation the latter part of November, was built by the New York Engineering Co.; it has 3¾-cu. ft. buckets, close-connected, and has an estimated capacity of 2000 yd. per day. It is thought the latter dredge will be operated throughout the winter. The ground, especially that which was formerly worked over, is quite free from boulders that hinder operations. The gravel is said to contain 1% black sand. E. S. Hare is superintendent for the company, Marquis Eaton, A. B. Cody, and R. R. Bailey, of Chicago, being president, vice-president, and secretary-treasurer, respectively. It is claimed that nine years' work for two dredges is assured.

At Elk City, the Idaho Dredging Co. and the Jennings Dredging Co., both managed by P. J. Jennings, built two dredges of the Hammond type the past autumn, one of which operated but a short time before closing down for the season. The former company has a considerable area of dredgeable gravel on American river; the latter has ground on Little Elk river, three miles north of Elk City.

In the Boise basin the Moline Mining Co. has operated a Risdon dredge near Placerville for the past 4½ years, having averaged 8 months per season, 27 days per month, handling 1400 cu. yd. per day, working three 8-hr. shifts. This dredge has 5-ft. buckets, open-connected, is equipped with a compound, condensing steam engine, the fuel for the boilers being wood that costs $3.25 per cord to chop and deliver to the dredge, the company owning the timber land from which the wood is taken. An area of about 80 acres of dredgeable ground is owned, the gravel being from 30 to 45 ft. deep, and overlying a soft sedimentary bedrock, which is easily cleaned. This material tested 35c. per yd., but in working over some of it with traction dredges several years ago only 28c. per yd. were recovered. The operating season for 1909 was slightly shortened by reason of the dredge being dry-docked November 1, so as to overhaul and re-inforce the hull, an unusual operation that was successfully accomplished, and the dredge put afloat again before the winter freeze-up.

MINING IN MONTANA, 1909.

Written for the MINING AND SCIENTIFIC PRESS
By CHARLES COPENHARVE.

Although the metal market during 1909 was unsatisfactory and the accumulating surplus of copper discouraging, mining in Montana was maintained about normal throughout the year, and the total production of copper exceeded 300,000,000 lb. Practically all of this came from the mines of the Butte district. Considering the small returns on the metal, at the prices prevailing throughout the year, an unusually large amount of dead-work was done together with development work, opening of new mines, making changes for the introduction of economies, and planning for the future. Although the experience of the large producers has not been encouraging in that direction,

Map of Butte District.

some of the new companies continued development, and several important mines have been added to the Butte list of copper producers. Half a dozen other companies are maturing plans for resumption of work, indicating faith in the future of the copper industry. The production of 1909 exceeds that of 1908 by about 40,000,000 lb. The Amalgamated company has matured plans for the expenditure of $2,000,000 during the coming year in making changes and improvements at its mines at Butte, much of this money to go into an installation of electrical machinery and power to take the place of all the present steam plants. One of the largest electrical power-plants in the world is being built at the great falls of the Missouri river, at Great Falls, Montana, and when completed it will furnish power to a central plant in Butte from which it will be distributed to all the mines. Amalgamated interests own the Great Falls electrical enterprise.

A number of changes and improvements are being made at the two large smelters of the Amalgamated

company at Great Falls and Anaconda. The largest stack in the world was put in commission at Great Falls during the past summer, and with its extensive system of flues is giving splendid results. The smelter and the concentrator are being enlarged, and when the improvements are completed the plant will have a capacity of about 5000 tons of ore per day. Its present capacity is about 3500 tons. At the Washoe smelter at Anaconda the company is building a new system of dams and reservoirs to settle and clarify the water from the concentrator before discharging into the Deer Lodge river. There will be a crescent-shaped dam near the stream itself, more than a mile and a quarter long and about 26 ft. high, with wing-dams branching from the main one so as to form compartments. It is anticipated that this improvement will do away with the remaining causes of complaint by farmers in the Deer Lodge valley, who allege damage from deleterious substance in the water.

The Amalgamated company is engaged in opening two new mines, the Badger State for the Boston & Montana company, and the Right Bower for the Anaconda. The Badger State claim carries the western extension of the Jessie vein of the North Butte company. A shaft has been sunk 1500 ft. deep. It will be made 500 ft. deeper before cross-cutting and driving. The Right Bower shaft is 525 ft. deep, and several levels have been run to connect with adjoining properties of the Anaconda company, including the Modoc, which is 1400 ft. deep. Sinking is continuing in the Modoc and it is the intention to make it as deep as the High Ore, which is down 2850 feet. In the Right Bower several good veins, one large, and of high-grade ore, have been opened. This property includes the extension of several of the best veins of the Butte-Ballaklava company. The Leonard shaft of the Boston & Montana company is also being deepened below 1800 ft. The Diamond shaft, an Anaconda property, is now the deepest working in the Butte district, being down 2960 ft., 600 ft. having been sunk during the year. The Mountain Consolidated shaft of the Anaconda company is 2290 ft. deep and is still going down. Sinking is proceeding at the Belmont mine of the same company, a depth of 1200 ft. having been reached. As this is a four-compartment shaft sinking has been slow. At the 1100-ft. level the Belmont has been connected with the 1600 in the Anaconda mine, there being a difference of about 500 ft. in the elevations of the shafts at the surface.

The Trenton company, owner of the Gagnon mine (Amalgamated), has found practically a new mine on the 2200 and 2300-ft. levels of that property, after the property was believed to have been practically worked out, and it has justified the company in deciding to sink a new, vertical shaft to replace the old incline. The new shaft is down about 400 ft., and will be deepened 2300 ft. where it will be connected with the lowest level of the mine.

The Amalgamated companies did 141,858 ft. of new work during 1909. The most important development done during the year in the Butte district was by the Butte Coalition company, which has been deepening the Tramway and Rarus shafts and opening new levels. The Tramway is now 2000 ft. deep and will be sunk another 200. Three new levels have been opened from the Tramway into the Minnie Healy, the lowest being at 1700 ft. Three new veins have been opened on the 1600 and 1700-ft. levels of the Tramway, and reports show that they contain the richest copper orebodies ever opened in Butte. The Tramway is the main working shaft for the Minnie Healy, the shaft of the latter mine having been abandoned on account of caving and because of fire in the upper levels. Practically a new mine has been opened under the fire zone, the fire being confined to old stopes on the 1200-ft. level. Between the fire and the next lower level there is solid ground 100 ft. thick, which will remain undisturbed as long as any fire lingers in the property. The Rarus shaft is 2200 ft. deep, the lowest level being 2000.

The North Butte company completed its main working shaft to a depth of 2200 ft., and is opening two new levels at the 2000 and 2200. Considerable lateral work has been done on the 1600 and 1800-ft. levels. During the past year the North Butte secured control of the Granite Mountain claim, owned by the Lewisohns, and the shaft is being raised from the lower levels to connect with the old openings which were down 900 feet.

Considerable development work has also been done in the Clark mines, the Original, Steward, Elm Orlu, and Poser. The latter is not yet producing, but the Elm Orlu is a new mine, which is yielding about 300 to 400 tons of ore per day. It carries a high percentage of zinc, and a concentrator for zinc has been added to the Butte Reduction Works for the purpose of handling the Elm Orlu ore.

The zinc industry has offered encouragement to some, and a 500-ton concentrator is to be erected near the Black Rock mine of the Butte-Superior company. The mine will be able to yield 500 tons of ore per day for ten years.

The most important new company that has entered the producing list is the Butte-Ballaklava, owner of a mine east of the Speculator and Edith May mines of the North Butte company. It has been developed to a depth of 1400 ft., and four large veins have been opened. One of them, on the 1400-ft. level, has 8 ft. of copper glance and bornite. A new steel headframe has been received and will be put up at once.

The largest independent company in Butte is the East Butte Copper Mining Co., which recently absorbed the Pittsburg & Montana. It is operating both the old East Butte mines and the Pittsmont, and the Pittsmont smelter, turning out copper at the rate of 7,000,000 lb. per year. Since the East Butte took over the Pittsmont the cost of production has been reduced from 13 to 10 cents per pound, and the mines have been placed in excellent condition. They are capable of yielding double the present production without effort. The Tuolumne Copper Co. has also developed a producer at the Tuolumne mine. The Davis-Daly Copper Co. has been confining its work entirely to the Colorado mine, which has been opened by levels to a depth of 1500 ft.

The British-Butte Mining Co., which promised much and loudly, has suspended operations with its gold dredge just west of Butte.

During the year 1909 the Butte mining companies

produced 310,532,474 lb. of copper, compared with 269,165,640 in 1908, and 240,887,516 in 1907. The production by months in 1909 was as follows:

Month.	Pounds.
January	26,502,608
February	24,871,730
March	28,077,510
April	25,347,428
May	26,443,244
June	25,268,888
July	26,580,820
August	26,070,130
September	26,584,180
October	28,166,166
November	27,889,140
December	18,643,830
Total	310,445,658

The production of the different companies for three years is as follows:

Companies.	1907.	1908.	1909.
Boston & Montana...	63,053,655	77,010,800	79,049,150
Anaconda	64,154,636	67,064,000	78,660,550
Butte & Boston	9,209,650	10,349,640	14,010,500
Washoe	6,438,420	8,569,170	11,669,970
Parrot	5,403,010	6,281,080	7,921,930
Trenton	6,794,475	6,229,940	8,547,378
North Butte	29,534,240	38,526,480	41,260,230
Butte Coalition	24,971,800	21,488,580	37,905,510
Original	17,296,940	24,936,700	19,088,260
*Pittsburg & Montana	4,785,090	4,295,100	7,789,830
Davis-Daly			878,250
East Butte	3,965,480		
*La France	2,168,975		
Miscellaneous	3,111,145	4,414,150	3,658,100
Totals	240,887,516	269,165,640	310,439,658

*East Butte absorbed the Pittsburg & Montana, and the La France is idle.

Activity in mining throughout the State was somewhat retarded because of the financial depression. Outside of Silver Bow county, mining is confined chiefly to Beaverhead, Broadwater, Madison, Chouteau, Jefferson, Missoula, Park, Fergus, Deer Lodge, Flathead, Cascade, Lewis and Clark, Ravalli, Lincoln, Powel, and Granite counties. Considerable gold dredging is being done in Madison, and prospecting for good placers is going on in other counties. The old Marysville mines in Lewis and Clark county are yielding the customary amount of ore, and some placer mining is being done near Libby in Lincoln county. The silver-lead mines near Libby and in Ravalli county are being developed into good producers. In the old silver mines around Granite some leasing is being done and lately there has been renewed activity by several of the old companies. The most important development in Montana has been in connection with the gold discoveries in Deer Lodge county, and in the Little Rockies country around Zortman and Landusky in Chouteau county. Some rich gold mines have been opened. In the Radersburg district, Broadwater county, the Ohio-Keating Gold Mining Co. has also opened a good property from which there are now regular shipments of high-grade ore. Attention has been directed to the Cook City district near the Yellowstone National Park, where a number of lead, silver, and copper properties are being opened. The district is so far from railroads, however, that transportation costs make mining at present unprofitable.

COPPER IN ARIZONA IN 1909.

Written for the MINING AND SCIENTIFIC PRESS
By C. F. TOLMAN, JR.

The year 1909 has been the most noteworthy in the history of the mining industry of Arizona. The four old camps, Bisbee, Clifton-Morenci, Globe, and Jerome, have not only been able to maintain, but some have increased their product, in the face of the continued demoralization of the copper market, and have placed Arizona still farther ahead as the banner producer of the United States. Arizona has demonstrated beyond peradventure that the law of supply and demand has not governed in the business of copper mining this year. The lower the price of copper, the greater has been the tonnage pushed through the reduction works, including more of the cream of the

Map of Arizona.

mine, for a shut-down is disastrous to a great copper mine, involving as it does a large investment of money, and open to rapid deterioration under such conditions. Those closely in touch with the copper industry know that here 'hide hunting' is practised in its most acute form, and that the rights of the future must be respected in regard to the copper supply as well as coal and iron. The general belief that some regulation of the copper output must come, and that whoever has a big proposition must be taken care of in the adjustment, has stimulated prospecting and copper hunting on the part of the energetic copper operators to an astonishing degree, and developments during the last year have been unparalleled.

The magnitude and rapidity of the developments can be appreciated by reference to Waldemar Lindgren's article on the copper resources of the United States, which was presented to the National Conservation Commission, February, 1909. In this contribution he states: "These four principal centres of production [Bisbee, Morenci-Metcalf, the old Globe

mines, and Jerome] must be chiefly relied on for many years if Arizona is to maintain her output." At that time the possibilities of the metallized zone along the contact between the Pinal schist and the Schultze granite were not appreciated, and the results of the developments at Ray have been made public since that time. Even so Mr. Lindgren states that "the prospect of discovering new important copper fields in Arizona is perhaps brighter than in any other State or Territory"; the truth of which has of course been abundantly proved.

The year 1909 has seen the development of an entirely new class of copper ore deposits, namely, disseminated chalcocite deposits in schists, which differ in many important respects from the disseminations in porphyry. A noted authority, writing of the Globe disseminations, states that they show no outcrop. The truth of the matter is that these are more certain and decisive than in any other class of copper deposit, and that both the primary mineralization and the secondary leaching above and enrichment below are plainly indicated in the outcrop. It is necessary to utter a word of warning here, for the wide-awake copper miners are already schist crazy, and the disease will probably become more acute as soon as the Globe and Ray mines begin producing. The fact that the United Verde and the Ray deposits are both in a schistose rock does not predicate further similarity between the ore deposits, and the fact is that these two are unlike in every respect except that both are of great value. Because a copper deposit is in schist is no evidence in itself of intrinsic value. Large areas of copper-bearing schist are known to me which carry copper in small scattered lenses, and in no way resemble schist disseminations. No two deposits could be more dissimilar than the rich small chalcopyrite fissure-veins of the Gibson properties of the Globe district, and the huge cone-shaped dissemination of the Miami, both of which are in the Pinal schist. Fortunately the evidences of primary mineralization, and secondary concentration and leaching, so well shown both at Ray and Globe, will be recognizable about other schist disseminations, and without these indications search for disseminated orebodies is not a legitimate mining gamble.

The main features of the Ray and Miami dissemination I have described in recent numbers of the Mining and Scientific Press, and the magnitude of the orebodies and their assay value have been given in the official reports of the companies. Besides the Miami, the Inspiration, the Black Warrior, the Cactus, the Live Oak, the New Keystone, and the Cordova companies, working along the Schultze-granite and Pinal-schist contact, are reported to have developed disseminated sulphide ores. The Ray Consolidated, the Gila, the Ray Central, and the Hercules & Arizona probably cover most of the Ray orebody. The size of this deposit is no longer a live question, for already the interest on the cost of development is becoming an important factor in the operations of the larger companies. The problems now confronting the companies are those of extraction and reduction. The future Ray dividends depend upon the degree of success which the management meets in devising suitable underground mining methods.

The other new camps that are receiving most attention are Silverbell and Ajo. At the former both the Tiro company and the Imperial are developing disseminated deposits in porphyry, with apparently encouraging results, and at Ajo extensive explorations are being undertaken, the results of which are not being made public by the interested parties. The smaller copper camps, namely, Twin Buttes, Helvetia, Courtland, and Johnston, are all developing and producing ore, and it now appears that they will be thoroughly proved in the next two years.

Of the four big camps, the developments at Bisbee have been most interesting. At the Shattuck & Arizona, orebodies have been found reported to be of similar grade to the bonanza stopes of the central portion of the ore-trough, though higher topographically, and geologically as low as anything yet found in Bisbee. Excellent orebodies have been uncovered in the Denn-Arizona, east of the proved ground, and along and near the line of truncation of the ore-bearing trough by the Dividend fault. The operations of the Copper Queen from the Lowell shows that the metallized area extends farther in this direction than suspected heretofore, and while the grade remains satisfactory, the bodies develop greater irregularity in shape than those of the central area. At Morenci-Metcalf the Shannon has been bettering the surface arrangement by building a standard-gauge road from Metcalf to the Shannon smelter. Several new companies have been reported in the daily press as planning to test outlying areas in this district. At Globe the developments on the Miami-Inspiration zone overshadow all other operations, so that the blowing in of the new smelter at Globe, and the generally satisfactory condition of the Globe Hill mines, have not received the notice that they deserve.

The depression in the price of copper appears to have stimulated the efforts of the larger operators in their search for satisfactory prospects, and to have driven the prospectors and small stock companies away from copper in a search for gold. The Gold Road region is at present the most promising of the Arizona goldfields, the development on the Tom Reed attracting most atention. The North Star, in Yuma county, is reported to continue to make good, and the Golconda is rumored as a possible large low-grade gold deposit of promise. The success in Sonora of the Peck machines for the treatment of the cemented gold conglomerate will probably direct attention to cemented placer deposits in Arizona. The operations of the United States Mining & Smelting Co. have caused a renewal of activity in the development of the zinc-bearing ores from the Kingman region.

In conclusion it may be said that in Arizona 'copper is king'. While an occasional gold mine may be found, while with better transportation and reduction facilities more zinc and lead ores may be mined, while better results may be expected from the cemented gravels, if their development be taken out of the hands of wild-cat companies and of cranks, nevertheless southern Arizona and northern Sonora will remain the Mecca for copper miners, and as the indications of the disseminated deposits are better known further successes in this class of mining may be expected.

BRITISH COLUMBIA.

Written for the Mining and Scientific Press
By E. Jacobs.

The value of the mineral production of British Columbia in 1909 is estimated at between $24,500,000 and $25,000,000, in the following approximate proportions: placer gold, $600,000; lode gold, $5,200,000; silver, $1,500,000; lead, $1,800,000; copper, $5,500,000; zinc, $500,000; coal, $6,800,000; coke, $1,665,000; building materials and miscellaneous, $1,200,000. Necessarily the revised returns will show some changes, but it is unlikely there will be any great differences.

Placer gold mining was not active in 1909. John Hopp, of Seattle, Washington, operated in the Cariboo district on a fairly large scale, and is preparing for more extended work next season. Philadelphia capitalists authorized Howard W. Du Bois to let a contract for the construction of a ditch and flume 20 miles long extending from Swift river to Quesnelle Forks, Cariboo, to supply water for hydraulicking gold-bearing gravel. In Atlin camp, Cassiar district, the season's yield is estimated at less than for any year since 1898, but there is promise of better results next season, water-supply difficulties having interfered with this season's work.

Mineral Resources of British Columbia.

The most important development in connection with lode mining was the sale of the Nickel Plate mine, Hedley camp, Similkameen, by the Marcus Daly estate to men who organized the Hedley Gold Mining Co., of New York, and late in the year proceeded to enlarge the power-plant at the mine and add to gold-saving facilities at the 40-stamp mill. Much development is to be done in 1910. Sheep Creek camp, in the Nelson mining division, made substantial progress, the Queen, Nugget, Kootenay Belle, and Mother Lode having produced gold from milled ores. This camp is attracting attention, and gives promise of becoming important and permanent. The Yankee Girl, at Ymir, was worked by New York men, who mined 3000 to 4000 tons of ore and prepared for extending operations. Owing to the Le Roi mine having been idle several months, the production of gold in Rossland camp was nearly 30,000 oz. lower than in 1908.

Production of silver and lead was larger than last year. More than half the total output was from the Consolidated Mining & Smelting Co.'s St. Eugene mine, East Kootenay. Other large contributors were the Blue Bell and Whitewater, in Ainsworth division; Rambler-Cariboo, Richmond-Eureka, Ruth, Standard, and Van Roi, in Slocan. The Richmond-Eureka and Van Roi are comparatively new mines, producing silver-lead ore of good grade. The Emerald, near Salmo, also shipped much lead ore, while the Silver Cup, in Ferguson camp, Lardeau, was an important producer of silver and lead. Most of the districts from which silver comes made a larger production than in 1908, the Slocan and Ainsworth districts particularly. Portland canal promises to have two or three new properties sufficiently developed to begin the production of silver and lead in 1910. Some timely information relative to this district is given in an official bulletin lately issued by the Provincial Department of Mines, Victoria.

The three chief copper-producing districts each show decreased production in 1909, though official figures will probably be higher than those included in the above estimate, the method of calculation of copper content of ores being different. Boundary mines continue to do remarkable work in mining and smelting. Granby costs per ton of ore—its annual report says, "including all expenses"—are $3.20, making the net cost of producing copper 10c. per lb.; the British Columbia Copper Co. claims even lower costs, namely, "including all charges from ore in place to sale of contained metals, $2.6322 per ton." Cost of producing, refining, and marketing per pound of fine copper, after crediting expenditure with gold and silver value is stated at 9.996c. for the company year. Quite recent announcements show even a lower average cost. Granby improvements at mines and smelter have increased the daily output capacity at both to about 4500 tons of ore. B. C. Copper remains at about 2000 tons, although enlargements are being prepared for.

Zinc, though not yet produced extensively in comparison with old zinc-mining countries, is gradually assuming local importance. In 1909 the Lucky Jim mine shipped in excess of 5000 tons of 52% ore. The Whitewater made 4660 tons of zinc concentrate (in addition to 3570 tons silver-lead) averaging 42% zinc with 15 oz. silver per ton. The Ruth shipped 655 tons concentrate running 50% zinc, with 28 oz. silver. The Van Roi's output of zinc concentrate was about 1400 tons averaging 44.3% zinc and 50.5 oz. silver. The growing value of the zinc-mining industry lately led to an effort to induce the government of Canada to conduct experiments with electro-thermic smelting of lead-zinc ores, of which there is an enormous quantity in British Columbia. New York capitalists recently bonded a group of claims

in West Kootenay having a very large surface showing of zinc ore.

Production of coal and coke was the largest yet made in the province in any one year. The principal producers were the Western Fuel Co. and Wellington Colliery Co., both mining on Vancouver Island, and the Crow's Nest Pass Coal Co., in East Kootenay. Among the new coal-mining enterprises are the Pacific Coast coal mines, which opened and equipped a mine at South Wellington, Vancouver Island, constructed seven miles of railway to Boat Harbor, below Nanaimo, and built there bunkers, docks, etc., and put in a coal washery and all requisite shipping facilities. This company is finding a market for its coal at Mexican ports. The Nicola Valley Coal & Coke Co. added to its plant and output at its Middlesboro colliery, Nicola Valley. The Vermillion Forks Co., on completion of a railway from the south, giving it transportation facilities, commenced shipping on a small scale. In East Kootenay the Hosmer Mines, Ltd., having completed its main entry and parallel tunnel, cutting ten seams of coal, settled down to mining in two or three of the larger of them, and to making coke. The Corbin Coal & Coke Co.

Centre Star Mine, Rossland.

also fairly entered upon a career of production, having opened its mine in an unusually large deposit of bituminous coal of excellent quality, a big market for which is open in the city of Spokane and other populous centres in northeastern Washington and northern Idaho.

Besides the large additions to plant—enlargement of its eight blast-furnaces, provision of bigger copper converters, and installation of more large blowers—at Grand Forks by the Granby company, important improvements were made by the Consolidated Mining & Smelting Co. at Trail. Both copper and lead furnaces were enlarged: another big Root blower, electrically driven, has been installed; more Huntington-Heberlein roasters and converter pots for both low-grade copper and lead matte, put in: lead-handling facilities added to the furnaces, the number of electrolytic tanks increased to nearly 600 in the lead refinery, and other extensions in keeping made to buildings and plant. The Tyee Copper Co. installed a second blast-furnace, 48 by 160 in., capacity about 12,000 tons of ore per month, and made other provision for copper smelting at Ladysmith, Vancouver Island, on a larger scale than in the past.

Certain developments of the year, not included in the foregoing, which is an incomplete summary owing to space restrictions, should not be passed over. One of them is the opening of a new mine in Wellington camp, Boundary district, by the B. C. Copper Co., which has done about half a mile of development, chiefly on a vein of oxidized ore carrying gold of an average value of about $7, with occasional shoots of arsenical iron running in gold and copper up to $20 per ton. A railway spur of three miles is being built to this mine. The Jewel, also in the Boundary district, has nearly finished the installation of a 15-stamp Fraser & Chalmers mill, Wilfley tables, slime-plant, and other gold-saving appliances. These Boundary developments, together with the determination of an important occurrence of bornite ore in the Marble Bay mine, Texada island, and valuable exploratory and experimental work at the Britannia mine and mill, Howe sound, are amoun the evidences of progress made in mining in British Columbia in 1909.

MINING IN WYOMING IN 1909.

Written for the MINING AND SCIENTIFIC PRESS
By A. C. DART.

At the last meeting of the State Legislature the resignation of H. C. Beeler as State Geologist was received and Edwin Hall was appointed. During the past six years the work of Mr. Beeler, who has entered consulting practice with an office in Denver, became well and favorably known. Mr. Hall, who at the time of his appointment was the president and general manager for the Copper Belt Mines Co., of Laramie county, has so far shown a firm intention to keep up the work of eliminating the undeserving properties.

Copper Mountain.—Activity in this district has been greatly stimulated by the prospect of the extension of the Burlington railroad. The Williams-Luman properties were taken over by Montana capitalists for a reported consideration of $100,000. This company has added to its holdings, has several thousand feet of development including a 1000-ft. shaft, and has made several shipments of smelting ore from which, in spite of the long wagon haul, good results have been obtained. The erection of a smelter of their own is under consideration. The Big Horn Copper Mining & Development Co. has been incorporated to work ground adjoining the Williams-Luman group and smelting ore is being shipped. Ground in this district is being tested by the Shoshone Gold Dredging Co., and others, with a view to dredging next spring. Large sulphur deposits near Cody have been purchased by Eastern people who will develop the ground and erect a plant.

Atlantic and South Pass.—A considerable revival of activities in this district has resulted from well directed attempts to apply modern methods of amalgamation and cyanidation to the abundant low-grade ores. Further impetus is given by the advent of cheap electrical power, furnished by the Boyson

Power Co., whose dam and hydro-electric plant, with an output of 6700 hp., have recently been completed. A part of this power will be used by the Boyson Mining Co., but a larger part will be sold by contract. An Eastern corporation, recently organized under the name of the McCandalas Development Co., also has been active. It has purchased the Duncan group of claims and in order to test the ores has leased the Mary Ellen and Dexter mills of 10 stamps each. It is reported that 5 ft. of $100 ore has been opened in sinking the Duncan shaft. The Mary Ellen mine, one of the richest in the district, is still tied up by litigation. The Security Gold & Copper Mining Co. has cut at depth the vein for which a cross-cut adit has been driven. Good ore is reported. Engineers representing California capital have reported a good body of $6 ore in the Carissa vein which answers well to amalgamation and cyanidation tests carried out under working conditions in a 10-stamp mill. Development has been pushed in the Big Chief, Snow Bird, Miner's Delight, Spangler, and several other promising properties. The XL Dredging Co., and capitalists from Lander, have been testing placer ground in the district and machinery will probably be installed in the spring. In the Lewiston district also improvement has begun. The machinery has arrived for a cyanide mill to be erected at the Good Hope mine. The Bullion mine has recently been sold to Duluth capitalists and J. McAvoy has taken a lease on a large tract of placer ground which he will test next spring. During the summer the Northwestern Mining & Development Co. was organized in Lander to operate lode and placer claims. The Anna Held mine, west of Atlantic City, is already being opened.

Encampment and Centennial.—One of the largest mining deals reported in Wyoming for some time is that recently put through by the United Smelters, Railway & Copper Co., of Cleveland, Ohio. For a consideration of $10,000,000 this company is believed to have secured the whole of the celebrated Penn-Wyoming holdings, including, besides the mineral claims, the Saratoga & Encampment railroad, the Encampment water works, and the 17-mile aerial tram. An active campaign of development is being carried on, but the tram, mill, and smelter, are not being used at present. Unusual activity was displayed during the past summer at the properties in the Elk Mountain district. The Walcott Copper Mining Co., owners of the Elkhart mine, have installed a boiler and hoist and are developing a medium grade of ore. In the lower workings of the Elkhorn mine a workable deposit of copper glance has been opened and several shipments, of an average grade of about 15% copper, sent to the Denver smelters. Other properties which have answered well to development are the Charter Oak, West Virginia-Wyoming, Elk Mountain, and Standard Copper. In the Centennial district the Rambler Copper & Platinum Co. has led in shipments and development. At present, tests are being made to determine the best method of treating the lower grades of ore, large bodies of which have been exposed, and shipments of high-grade ore are keeping four teams busy on the ten-mile haul to Holmes. It is of interest to note that these are actually platinum ores. The milling grades average about 8% copper, 4 oz. silver, 0.75 oz. platinum, and often hardly more than a trace of gold. The Lake Creek Gold Mining Co. has been driving a cross-cut to tap the Kansas vein which, in the shaft, shows 5 to 15 ft. of a good grade of gold-bearing copper ore. The old Modena and Joe Davis claims have been responding to further development at the hands of the Topeka Mining Co.' At about 1000 ft. from the mouth of the old adit the ore-streak is seen to be perceptibly widening, and shows increased mineralization. The Pollyton Gold Mining Co. and the Mohawk Gold & Copper Co. have both been prospecting the Osceola vein by means of shallow shafts and trenches.

Sundance.—The Bear Lodge Co., of this district, has installed an engine and hoist capable of working to a depth of 600 ft. and is pushing development work. The Gold Cliff Mining Co., backed largely by South Dakota interests, has been organized recently to operate in the Kirwin district, and already several deposits of a good grade of gold, silver, and copper ores have been opened.

Douglas Creek.—The American Gold Placer Co. carried out extensive steam-shovel operations here the past summer but on account of having to handle the material in cars, both before and after sluicing, the returns were not as good as was expected.

Thermopolis.—The Wyoming Sulphur Co. recently tapped the main shoot of its deposit and found a 50-ft. core of almost pure sulphur. The refining plant is entirely unable to handle the material extracted. The present output of about 500,000 tons per year is all contracted and the capacity of the plant is to be greatly increased.

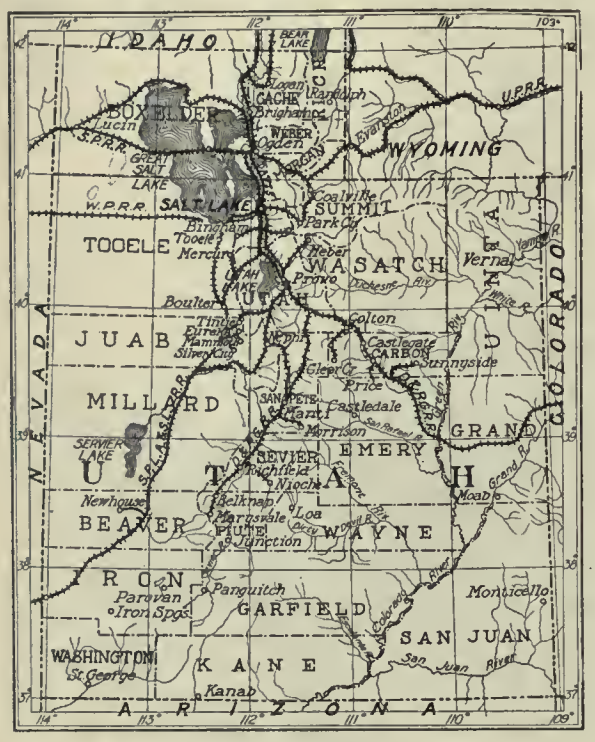
Casper.—The asbestos deposits of Casper mountain have been greatly exploited during the past year and several deposits are being worked. The North Western Asbestos Mills Co. was formed in Cheyenne early in the year for fiberizing the crysotile mined by the North American Asbestos Co., and the Wyoming Consolidated Asbestos Co. The capitalization is $1,000,000, and the par value of the stock $10 per share. The structural work on the mills, situated near Casper, has been completed and the machinery is expected to arrive at any time. It has been rather persistently rumored that the capitalization of some of the companies was excessive and the State Geologist has written to the Denver press a statement to that effect.

Hartville and Sunrise.—The size and importance of the iron mines of the Hartville iron range is little realized. In point of production the Sunrise mine, in 1907, held 17th place in the United States, and, outside of the mines of the Lake Superior region, it ranked as the third greatest producer. The field was first entered by the Colorado Fuel & Iron Co., in 1900, and today the output of well over half a million long tons per year supplies practically all the ore treated by the Pueblo plant. Mining is still being carried on by steam-shovels, two in ore ond one stripping waste, but the far-sighted policy of the management is well shown by the rapid development of an underground mine employing the milling system of mining.

UTAH'S MINES, MILLS, AND SMELTERS IN 1909.

Written for the MINING AND SCIENTIFIC PRESS
By ROBERT H. BRADFORD.

Utah's standing among the States of the Union in the production of gold, silver, lead, and copper is enviable, as she does not rank below fifth in any. This high standing is maintained from year to year. While mining conditions and metal prices in general throughout the world in 1909 were anything but flattering, there was marked activity in the Utah properties. Although the production for this year has fallen off in some of these metals, a vital reason has been the prevailing low prices. Extensive development has taken place, and large orebodies are ready for heavy production when metal prices warrant.



Map of Utah.

Utah's metal output alone for 1908 and 1909 fails to show the real activity in mining operations.

Bingham. — The year 1909 has been a record marker for Bingham. The Utah Copper Co., up to September 30, had produced more than 41,000,000 lb. of copper, and increased output for the last quarter brings the total production to nearly 60,000,000 lb. The physical condition of the mine continues to improve. Stripping operations are kept far in advance of the shovels on ore, and at any time increased output can be made to meet the demands of the concentrating mills of the company. The cost of production for the last half year was reduced to 8c. per lb. of copper. The net profit from mining and milling operations of this company for the year reach $2,500,000. These enormous earnings on an ore averaging less than 2% copper are phenomenal, and show the results of careful and painstaking operations on a tremendous scale. The company's report shows a total cost per ton for mining and milling of but 82c. This is on a basis of the ore being extracted entirely by steam-shovel work.

The Boston Consolidated, for its fiscal year ending September 30, produced 16,684,000 lb. copper, 89,326 oz. silver, and 7964 oz. gold. The company has exploited both the porphyry and the sulphide mines, the first by the caving system and the second by square-set stoping. The development in the porphyry mine amounted to 51,060 ft., and in the sulphide mine to 4376 ft., lineal extension. During the year there was destroyed by caving 30,095 ft. of workings and there remained open on October 1, this year, 71,891 ft. of workings. The extraction of porphyry ore amounted to 645,679 tons, which was shipped to the concentrating mill at Garfield for treatment. For hauling this ore 11,592 railroad cars were required. These cars were loaded from the enormous steel bin at the foot of the company's inclined tramway down which all the porphyry ore was lowered from the mine. The sulphide mine produced 69,375 tons of ore during the year ending September 30, and this ore was sent direct to the smelter for treatment. The Boston Consolidated Mining Company's property directly adjoins the Utah Copper on the south and lies higher on the mountain. The disseminated porphyry ore belonging to the two companies is mined from the same monzonite laccolith which makes up a continuous massive deposit. To continue the steam-shovel work, now so well under way by the Utah Copper Co., means to undermine the ore on Boston Consolidated ground. It is, therefore, not surprising to hear of a pending consolidation.

The Ohio Copper Co., whose properties adjoin the holdings of the two above named companies, has had a busy and important year. The 13,000-ft. adit from the concentrating mill at Lark to the mines at Bingham has been put into operation for haulage of ores, and the success has been even greater than was anticipated. The adit reaches the quartzite and porphyry ores at a depth of 1000 ft. below the bottom of Bingham canyon. The ores from the workings above this level are dropped through inclined chutes to bins directly above the track. Trains operated by electric locomotives are loaded and the ore sent direct to the mill. On the second day of December the first section of the large concentrator was put in operation, and since then has been treating 400 tons of ore per day, with excellent results. The final capacity of the mill will be 2400 tons per day. Another section is now ready to begin operation, and the whole mill will be rapidly pushed to completion.

The Yampa mine at Bingham continues to produce about 20,000 tons of sulphide ore per month. This is handled by aerial tramway a distance of 1½ miles down the canyon to the Yampa smelter where, with 4000 tons of custom ore, it is smelted to copper matte. The converter plant installed by the company in the early part of the year has been closed down since November and at present the matte is shipped to the A. S. & R. smelter at Garfield.

The Utah Consolidated's output for 1909 approaches 300,000 tons of copper ore. At present the ore all goes to the Garfield smelter, but by May 1910 the new smelter of the International Smelting & Refining Co., at Pine Canyon, Tooele county, will be in operation, and the ore from the Utah Consolidated

will be sent by aerial tramway, of the Bleichert system, over the mountain direct to the smelter. The tramway, 21,000 ft. long, is now under construction. The smelter buildings are taking definite form. The 7000 tons of structural steel was furnished by the American Bridge Company.

The Bingham mines of the United States S. R. & M. Co. are important producers, although owing to the closing of their copper smelter at Bingham Junction at the order of the Court, because of complaints of the valley farmers, the output of copper ores has been curtailed during the year. The lead ores from the company's mines, along with much custom ore, are treated at the lead smelter at Bingham Junction. Other producers of Bingham are numerous, but for 1909 no heavy output from any of these need be especially mentioned.

Tintic.—The Tintic district continues to hold the distinction of having more dividend-paying mines than any other in the State. The old producers in the class with the Centennial Eureka, Grand Central, Eureka Hill, and Mammoth are showing excellent grades of ore with depth and increased development. Around Godiva mountain to the east many important producers of more recent date are now sending out rich lead and silver ore. These include such properties as the Colorado, Iron Blossom, Sioux Consolidated, Gemini, Uncle Sam, May Day, and others. Most of the ore from these mines goes direct to the Salt Lake valley smelters at present since the Tintic smelter closed late in the year. The Colorado mine has paid as dividends practically 90% of the net receipts from ore, and has thus established a record that few, if any, mines in this country has equalled.

Park City.—Much development work continues to be done in the mines of Park City, and the orebodies show that this district has before it a long period of successful mining operation. The Silver King continues to be the leader in the production of rich silver-lead ore, as evidenced by the quarterly dividends of 15c. per share. The Daly Judge, Daly West, Ontario, and Little Bell show excellent condition, while many of the newer properties are showing flattering prospects of rivaling the older mines for supremacy.

Mercur.—The Consolidated Mercur continues to produce bricks of gold for the Salt Lake Government Assay Office. Improvements in treatment methods for the base ores give promise of still greater success in the future, due to increased extraction of the gold at less cost per ton. The little mill of the Boston & Sunshine Co., at Sunshine, six miles southwest of Mercur, is doing excellent service. The mill treats 125 to 150 tons of ore per day at a cost of 73c. per ton. The extraction is extremely satisfactory for the clayey ore; the tailing runs only from 20 to 40c. per ton. The mining costs are well down, so that the company can reckon on any ore containing more than $2.80 per ton being payable. The dividends since the mill started, in May of this year, have amounted to $13,500.

Other mining camps that space alone compels me to pass with but simple mention include the Alta, Deep Creek, Beaver County, Sevier, Park Valley, and Gold Springs.

Salt.—The brine of the Great Salt Lake continues to be an important source of salt. During 1909 the Inland Salt Co. harvested 40,000 tons. This limited amount more than supplies the inter-mountain States. Were the demand increased many fold the company could readily proceed to supply the same.

Minor Minerals.—Hydro-carbons, iron ore, fire clay, gypsum, sulphur, antimony, phosphate rock, limestone, petroleum, cement rock, building and ornamental stone, uranium, vanadium, and radium minerals are all important in Utah, and are awaiting further development as the country grows.

JOPLIN ZINC-LEAD DISTRICT IN 1909.

Written for the MINING AND SCIENTIFIC PRESS
By OTTO RUHL.

The Joplin district breaks all previous records in the production of both lead and zinc ores for the year 1909. The output of zinc ores reported for the first fifty weeks of the year shows a total of 289,830 tons including both zinc blende and calamine. The lead ores for the same period total 42,426 tons. Such an output is the greatest ever known for the same period, and estimating the remaining two weeks the year will close with the zinc tonnage in excess of 300,000 tons, and the lead tonnage in excess of 43,000. The gross value of the ores was, zinc $11,743,656, and lead $2,325,893, giving a total of $14,069,549 for the first fifty weeks of 1909. Estimating the value of the ore for the remaining two weeks of the year, the total for 1909 should approximate $14,600,000, which was exceeded only in 1907. The year 1909 therefore breaks all records as to tonnage of both ores and all records of value except the year 1907.

The past year marks the first time in a number of years when the data were kept so that the output of zinc blende and calamine were separate, and the results accurate. I inaugurated the system this year, and this makes it possible to arrive at a better general knowledge of the ore resources of the district, and also affords more reliable averages of the prices paid for both blende and calamine. The result will be that the average price of blende-ore will appear much larger, and at the same time it approximates much nearer exactness. The system revealed the fact that the calamine bore to the zinc blende the relation of a little over 1 to 10. Thus the zinc ore consists of 261,411 tons of blende and 27,239 of calamine. The average price of blende for the fifty weeks was $42.23, and the price of calamine $24.08 per ton, while the average of both grades taken together is $40.51. The average price of lead ore for the 50 weeks was $54.82. The highest base price paid for zinc blende ore was $53; for calamine $30: for lead ore $60. The highest prices paid for any lots of these ores were for zinc blende $55; for calamine $37; for lead $63.

As compared with last year's averages the advantage is much in favor of 1909 with the zinc ores and about even with the lead. For the same period last year the zinc blende averaged $34.17; no data were kept of calamine, but the lead ores averaged only $55.21.

The ore-price movements show a consistent advance

for the entire year for the zinc ores, while the lead ores have almost as steadily declined. The first of the year opened with decided strength shown in both the lead and zinc ore markets. Toward the opening of the spring and through the summer there was a slight weakening in both ores, which was speedily changed to an advance for the zinc ores from that time to the close of the year, when the price-level has been above the $50 mark for blende and $28 for calamine. Lead ores on the contrary have shown a gradual weakening to the end of last week, when it closed at $54 per ton, or at a level below the average of the price maintained during the panic year of 1908.

The higher price-level for zinc ores has helped to stimulate the production of all grades of zinc ores. To that reason, however, is due only in a general way the increased output of this year. During the year 1908 while ore prices were low, a large majority of the low-grade ore-producers were shut down, their cost of producing ore being higher than the price received for the ore. Producers of higher-grade ores continued in operation throughout that year, and their successful operation turned other operators toward the exploitation of such orebodies. As a result many new deposits of this class of ores were opened on a lower cost-basis, and when a higher price-level came, and the old low-grade sheet-ground deposits could be again worked at a profit, the producing capacity of the district had been largely increased by the new work.

Still another cause contributing to the present increased production of the district, lies in the fact that just prior to the panic in the fall of 1907, there was coming into the producing list a large number of new mines in the sheet-ground camps of Webb City, Prosperity, Porto Rico, and Duenweg. These mines had been provided with mills that in many instances had never been operated or had been operated just long enough to get the mill into running order. When ore-prices went above the $45 level these properties at once began operation, and the production jumped greatly. In addition to this the men who had faith in sheet-ground mining had just begun the opening and development of a new area west of Joplin during the latter part of 1907. The panic which ensued, while it stopped actual production, did not stop the work of prospecting and development. These went steadily ahead on many leases and when 1909 came there were a number of shafts down to the ore. When prices reached $45 the mills went up and already there is a large production coming from this field which is not strictly a sheet-ground camp but a disseminated ore camp where the ore is found thinly scattered through flint in a blanket formation. There is now in progress a great deal of work which will result in still greater production from that part of the district. The area promises to become a rival of the north sheet-ground field at Webb City.

Another important development lies in the deeper deposits of ore now being mined at Cave Springs in Missouri and at North Empire in Kansas. These ore deposits are found below the ore horizon hitherto defined by the Grand Falls chert member of the Mississippian rocks. As developed at Cave Springs the chert member has a well defined ore deposit down to the 180-ft. level. Below the chert member at 220 to 290 ft. a second deposit is found which consists of blende disseminated through a limestone member, presumably of Keokuk age. The limestone is soft and striated, and the disseminations of the ore in the rock appear to be associated closely with the dolomite which is found throughout the deposit. Identical conditions have been found in the Ihlseng shaft north of North Empire.

Since the development of these two shafts drilling has shown the same deposits in the heart of the old North Empire camp at practically the same levels. These three different showings are on territory near together and seem to demonstrate a new mining area with deeper deposits. The Herald Mining Co., at Cave Springs, has 40 acres well drilled and showing this type of deposit. Across in Kansas, on the Robinson and Ping lands consisting of 50 acres, the drilling so far done reveals the same deposit. On the Murphy land in North Empire 5 drill-holes are in the ore and a shaft is being sunk. Still further west drilling has been done, but more than the fact that it was successful nothing has been announced.

While the above deposits are the first to be developed by shaft they are not the first discoveries of a lower ore-level. Drilling at Springfield, Aurora, Carthage, Spring City, Hornet, and Quapaw revealed the ore some time ago, but there was no development attempted to ascertain the real value of the deposit. More recent drilling south of Galena has also revealed the same deposits. All of this corroborative evidence seems to forecast another valuable addition to the ore reserves of the Joplin district, and is considered by most of the progressive mine operators to be the most important development of the year.

Camp growth has been remarkable in some parts of the district. Especially have the Carthage, Sarcoxie, and the east-end camps grown. These have furnished a large part of the increase in production. The southwestern camps of Miami, Quapaw, and Galena have shown remarkable growth, the first two in actual output and the latter in the number of new enterprises launched during the latter part of the year. There has been much new development east of Miami, at Peoria in Oklahoma, and farther south in that State and east to Seneca, also northeast to Spurgeon, north to Spring City, and on to Joplin, so that the same railway company that put in the new railroad from Miami north to its new camp is now building east and northeast through this newly developed territory. Aided by railway facilities there should be a great increase in production within another year.

The sheet-ground camps at Webb City, Prosperity, Duenweg, and Oronogo have been showing steady progress since the latter half of the year. These camps, together with the new disseminated deposits west of Joplin, are inaugurating the building of much larger mills, and the mill that is smaller than 300 tons is condemned as wasteful. The average is more nearly 500 to 600 in these camps, and the tendency is toward still larger plants. The low percentage of concentrate in the mineral hoisted makes it necessary to handle the ore in large quantities.

Special Correspondence.

WASHINGTON, D. C.

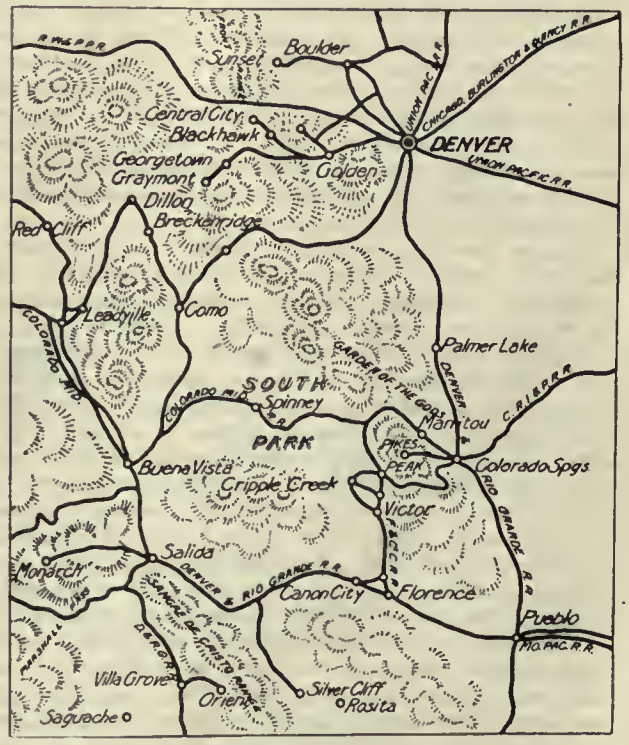
Bureau of Mines Bill Reported.—Cullom Resolutions.

The committee on mines and mining of the House of Representatives did not take long to reach a conclusion on the bureau of mines question. All of the bills introduced into the House with the exception of one that came later, were discussed. A bill was framed and reported favorably. It was immediately placed upon the calendar, and will come up for hearing directly after the holidays. It is practically the Douglas bill that passed the House last year, with the amendments suggested by the Senate. It provides that there shall be a Commissioner of Mines at a salary of $6000 per year, and, "That it shall be the province and duty of said bureau and its commissioner, under the direction of the Secretary of the Interior Department to foster, promote, and develop the mining industries of the United States; to make diligent investigation of the methods of mining, the safety of miners, the possible improvement of conditions under which mining operations are carried on, the treatment of ores and other mineral substances, the use of explosives and electricity, the prevention of accidents and other technologic investigations and inquiries pertinent to said industries, and from time to time make such public reports of the work, investigations, and information obtained as the Secretary of said Department may direct, with the recommendations of such bureau." The bill also provides for the transfer of the technologic branch of the United States Geological Survey to the Bureau of Mines. The Senate committee on mines and mining, which is headed by Charles Dick, the senior Ohio Senator, held a meeting for the preliminary consideration of the subject, and decided to hold a series of public hearings after the holidays. The House committee accompanied its bill with a report which stated in part that, "The demand for such a bureau has steadily grown with the growth of the mining industry of the country, and the substantially unanimous testimony and appeal from every quarter recognizes the necessity of some central governmental bureau where the varied needs and interests of this great industry may be studied and promoted. * * * But there is one other consideration which your committee cannot refrain from urging. The great growth of the mining industry of the United States in recent years has been attended with a disproportionate and appalling loss of life, due to accidents and explosions in mines. The horror and sadness of some of these are still fresh in our memories. It is inconceivable that such accidents might not be prevented. The cause, or causes of them are obscure, as was shown at our hearings; but the danger, whether gas or dust, or both commingled, or whatever the cause, must disclose itself to adequate scientific investigation. When we recall that these accidents in 1907 sacrificed the lives of more than 3200 persons, that this appalling loss of life has continued from year to year among the men who in darkness and dangers courageously pursue their vocation, the appeal in this regard becomes well-nigh imperative." Stirred by the catastrophe at Cherry, Shelby M. Cullom, Senator from Illinois, introduced in the Senate a resolution calling upon the Secretary of the Interior to report on the following questions: (1) The number of Federal stations equipped with rescue appliances which are in operation in the mine fields. (2) The number of Federal stations essential to the proper safeguarding of life which should be established in the mine fields, with an estimate of the cost of their construction and operation during the next fiscal year. (3) The opinion of the mine experts of the Department of the Interior as to the causes of the numerous accidents, and their views as to the action the Federal Government should take to prevent or at least minimize them in the future. The resolution passed after a rather spirited debate, Joseph W. Bailey, of Texas, objecting to the resolution on the ground that it made inquiry into matters that belonged solely to the States. He denied the right of the Federal Government to establish and maintain rescue stations in the various States. An echo of the Cherry, Illinois, disaster, is also seen in a strange bill introduced in the House by Alfred B. Garner, of Ashland, Pennsylvania, who asks that the sum of $2,500,000 be appropriated annually "for the purpose of relieving the poverty, destitution, or distress of the parents, widows, or orphans of laboring men in any part of the United States killed while in pursuit of their labor." Mr. Garner says numerous national calamities have befallen the laboring men of the United States at various times and places and that the death of the breadwinner leaves the parents, widows, and orphans in destitution and poverty. Whenever such calamities have occurred in foreign countries, Mr. Garner says, it has been the policy of the United States to furnish the persons afflicted large and substantial financial assistance. He thinks it is only just and equitable that when calamities occur in the United States, the same or a fuller measure of financial support should be given the afflicted persons.

DENVER, COLORADO.

The Year in Colorado.—Bad Weather but Good Work.— Progress in Mining and Metallurgy.

The weather in 1909 was at its worst. All precipitation records were broken. The snow stayed long in many camps, hindering prospecting and delaying transportation. This was especially true in the San Juan, where trains were



Mineral Districts of Colorado.

blocked until late in the spring. In the latter part of September a flood wrecked the D. & R. G. tracks in many places so that traffic was suspended for the greater part of October. Uncertainty regarding the tariff legislation was another factor. Low prices and dull markets prevailed in all the sulphide camps. Probably Leadville was most seriously affected, as the greater part of its ore is now low grade, and the margin of profit small. Most of the work was carried on by lessees who could ill afford to lose. The Yak tunnel, which is to be for Leadville what the deep drainage tunnel is for Cripple Creek, was not far enough advanced during the first part of the year to be of any appreciable advantage. The companies which could, took advantage of the dull times to prospect and develop. A great deal of diamond-drilling was done during the year. By the middle of June the Central Colorado Power Co. was in position to furnish electric power from its Shoshone plant to the mines. Many of those to which it is difficult to get fuel have availed themselves of the cheaper power, and this should be an important factor in reducing costs.

Many of the old mills have been remodeled so as to make a lead-zinc separation.

The Clear Creek district has fared better than any of the other sulphide camps. The numerous gold producers have given it a certain stability during the hard times. The Newhouse tunnel was advanced steadily during the year and is now a little over five miles in length. With is numerous laterals it drains an immense territory, and opens many famous producers. Another notable achievement was the tapping of the water in the Seven-Thirty shaft by the raise from the Burleigh tunnel. The connection was made on December 9. This opens a large block of supposedly rich ground. At Georgetown a mill is being built to treat the mixed sulphides by chlorination. If this Malm process is a commercial success it will add greatly to the wealth of the district. The North American Smelter & Mines Co., which has purchased the old Golden smelter, seems to hold the solution of the problem of maintaining a smelter in the district. The company controls a sufficient number of mines to assure a continuous ore supply. The plant at Golden is being remodeled preparatory to starting this month. It has been especially noticeable during the past year both in the San Juan and Clear Creek districts that a great deal of outside capital was being invested. The tungsten industry is in the most prosperous condition in its history. Resumption of work at the great steel plants has created a heavy demand for tungsten ore. Almost all the important mills in the district have had to install new machinery. The district has gradually extended until now it takes in the properties near Rollinsville in Gilpin county. Coördinate with the tungsten industry in importance might be mentioned the dredging at Breckenridge in Summit county. The operators have had an unusually successful season, and will attempt to operate throughout the winter. As yet no great difficulty has been experienced and the dredge men are confident of success.

Cripple Creek has maintained a nearly uniform output during the year. The production up to December 1 was $14,487,362. Allowing the usual amount for December would bring the production for 1909 to nearly 16 millions, a trifle less than in 1908. The mines have been operated almost entirely by lessees. In all, seventeen companies have paid dividends. The cyanide mills near Colorado City are estimated to have handled about 12 million dollars worth of ore from the Cripple Creek district. At the beginning of 1909 the deep drainage tunnel had been advanced 4505 ft. from the portal end. The intermediate shaft had been sunk, and a total of 377 ft. driven from its bottom, making three headings, with a total footage of 4882. The portal heading and that from the intermediate shaft met exactly, last July. The remaining breast has been advanced steadily, and allowing the usual 300 for December the tunnel should measure about 12,100 ft. The $160,000 necessary to complete the work has been subscribed. The tunnel should be completed in about eight months. Leasing has been more in vogue during the past year than ever. What development has been done by the large companies has strengthened the belief that the rich ore-shoots extend to some distance below the present water-level.

No bonanza camps have been opened in Colorado during the past year. Probably the most important find was near Newcastle, where there is a small boom in progress, and a new camp called Goldstone has grown up. One good copper mine, with a rather large acreage, has been reported from nine miles north of Canon City. The interest seems to have swung from metal mining to oil. Drilling outfits have been at work prospecting in the San Juan district, Mesa, Routt, Boulder, Elbert, and El Paso counties. The most encouraging results have been obtained from the work in the western counties. Some advances have been made in metallurgy. A 50-ton Kuenzel oil furnace has been installed and operated at Buena Vista. The furnaces are comparatively cheap to construct, costing about $15,000. What is known as the Portland cyanide process has been perfected in the experimental mill of the Portland company. In this process the tellurium of the Cripple Creek ores is dissolved instead of being removed by roasting. The company has a 400-ton mill nearly completed at its mines near Victor.

TORONTO, CANADA.

Year at Cobalt.—Gowganda, Elk Lake, and Porcupine Lake. — Iron, Coal, and Oil.—Mergers

The year has been characterized by steady progress in Canadian mining industries, and will show a considerable advance in the output in most lines, over that of 1908. Shipments from Cobalt have largely increased, and numerous improvements in plant and equipment have been made. Nevertheless few mines have been added to the shipping list, the majority are still in the prospect stage, and some which once shipped extensively have produced little. The dividends paid, however, show that the camp is getting on a substantial basis. The total payments since the beginning in 1905 will approximate $16,750,000 from 17 companies. More than half, or about $9,000,000, will have been paid during 1909. Cobalt mining stocks have tended downward because the purely speculative element is being largely eliminated. The silver field has been steadily expanding in several directions. The sale of a large number of properties on the Gillies Limit, lying to the south of Cobalt, has been followed by extensive development. Early shipments are expected from the Waldman, Wyandoh, and some others. In South Lorrain the Wettlaufer mine is making shipments. The most extensive work in the outlying districts has been carried on in the Elk Lake and Gowganda areas, where a number of mines have been sacking ore for shipment. These districts have been greatly retarded by the want of transportation facilities. Conditions at Gowganda have been considerably improved lately by the construction of roads, and shipments of ore will be made during the winter. The contemplated improvements in the navigation of the Montreal river, to be undertaken in the spring, will greatly aid the mining industry. During the late fall reports of important gold discoveries at Porcupine lake and several other localities in northern Ontario, near the line of the Temiskaming & Northern Ontario railway, attracted a rush of prospectors. Government officials confirmed the existence of gold in promising quantities on the surface, but the value at depth is still undetermined. Some heavy investments in these properties are reported, companies are being formed, and the usual glowing appeals to the speculative public will be made before long. A large influx into this region is anticipated in the spring. With the experience of Larder Lake still unpleasantly fresh in the mind it will probably be difficult to excite public enthusiasm until development has proved the value of some of the prospects. As to Larder Lake there is little to be said. Some of the companies are still in operation, but the results hardly justify the expectation of their ultimately making good.

There has been a decided impetus given to iron-ore mining by the general revival of industry and the increased demands of the furnaces. The Dominion Bessemer Ore Co. has opened a mine in the Port Arthur district, and began shipping in the fall. Operations will be conducted on a larger scale in the spring. The mica industry which had been for some time languishing, owing to over-production, began to improve toward the end of the year and the mica-trimming works in Ottawa resumed activity. Owing to the large stocks of raw material on hand it is likely to be some time before mining becomes active. Coal mining in Nova Scotia was considerably disturbed by an extensive strike of the miners affiliated with the United Mine Workers of America. The company principally affected was the Dominion Coal Co., employing usually upward of 5000 men in its collieries at Glace bay. A considerable proportion of these, belonging to the Provincial Workmen's Association remained at work, but the strike, which began in July, crippled operations for some months. The company gradually strengthened its force and resumed its normal output. During the strike, now practically over, the company was unable to furnish coal to the Dominion Iron & Steel Co.'s plant, at Sydney, for which about 150,000 tons were imported from the United States. Other coal mining companies largely increased their output. The industry in the western provinces is rapidly growing.

The modern tendency toward the concentration of capital in large enterprises and the absorption of smaller concerns

have been much in evidence in Canadian mining affairs. Several extensive mergers have been put through, including the amalgamation of 11 cement companies in the Canada Cement company with a capital of about $30,000,000, two asbestos mergers, and the consolidation now in process of the Dominion Steel & Iron Co. and the Dominion Coal Co., with a joint capital of about $57,000,000. Extensive oilfields have been discovered in the Province of Alberta, upward of 300 miles north of Edmonton. These promise to attract much attention. Evidence recently given before a committee of the Canadian Senate by Alfred von Hammerstein, who has been exploring this field for eight years, and put down numerous wells scattered over an area of 60 miles, is to the effect that oil and gas occur in large quantities through this region.

MEXICO.

Financial Conditions.—Railway Extensions.—Metallurgical Improvements.—De-Waterers.—Filters.

A review of the financial conditions in Mexico during the past year unfortunately is not altogether cheerful. The influence of the panic in 1907 in the United States is still felt, and the number of new mining enterprises, the amount of development, and the investment of capital, has borne no relationship to the opportunities that exist. The only really promising outlook is seen in the steady increase in railroad mileage, especially in the undeveloped and only partly prospected Pacific Coast regions of Tepic and Sinaloa. This railroad expansion will undoubtedly result in a great number of new mines being taken up and developed. The most important of these railroads is the Southern Pacific of Mexico, extended from Guaymas to Mazatlán, beyond which it probably will be completed to Guadalajara before the end of the year 1910. F. S. Pearson's activities in Chihuahua will eventually give a cross-country line to the Pacific that will open up another important territory. David E. Thompson's purchase and extension of the Pan-American railroad will make the connecting link from the United States to Central America. The line from Acapulco north along the coast to Zihuatanejo, will help prospectors to reach the coast range, which is known to be a good gold belt, mined extensively by the early Spaniards. The projected line from Cuernavaca to the Balsas river, which now seems to be almost a settled fact, will also tap this same region. A new road from Guadalajara to the sea, has been started, and will pass through Ayutla and Autlán, giving Jalisco an independent port of its own at Chamela. The line from Pachuca to Zimapán, with the probability of an extension to Tampico, will also open a valuable territory. But while mining will undoubtedly be stimulated by greater facilities in transportation, there still remains a large number of mines with known deposits of good ore that cannot be worked profitably without the necessary machinery and capital.

With the low price of silver, higher wages, deeper mining, and the scarcity of capital for investment, the Mexican silver mine manager has been forced to improve methods both in mining and metallurgy; and while much has been done, there is opportunity for doing more.

The Mexican mine manager gets to look upon cheap labor as a thing that is so cheap that he can afford to waste it, with the result that in many camps the cost of mining and milling is far more than the costs at similar mines in the United States.

There has been a steady improvement in the organization and equipment of important mines during the past year. Electrically driven centrifugal pumps for both station use and sinking are being generally adopted in place of steam or compressed air. The steady increase in the number of hydro-electric power-plants, and the net-work of power-lines that are now reaching all the important mining camps, are largely responsible for this change. For the same reason electric hoisting is being generally adopted, and electricity is being carried underground for lighting and for driving ventilating machinery. Electric-air rock-drills have been proved to be not only successful but economical in several mines. Electric distribution of power being more economical than compressed air, they can be conveniently placed underground for drifts and headings, but in winze-sinking they are not so convenient to handle. The most popular drill of this type seems to be the Temple-Ingersoll. There have been over 60 sets installed in Mexico during the last 18 months; 4 at Guanajuato, 9 at Pachuca, and 6 at Necaxa, besides individual installations at other mining camps. Acetylene lamps are being experimented with at some mines and a few flare acetylene lamps are being used underground for contractors' work. Electric light is largely used for stations and main gang-ways, but cannot be used in headings, as economically and conveniently as acetylene.

During the year the cyanidation of silver ores has been brought to a high state of perfection. The percentage of extraction has been increased while the costs have been lowered. The most noticeable features have been the tendency to increase the crushing efficiency of the mills as a whole, by careful step-reduction in crushing, but there is room for improvement. Single-discharge 5-stamp mortars are still almost exclusively used throughout the silver camps, with a maximum crushing efficiency of 7 to 8 tons, through a 3-mesh screen per 24 hours. The weight of stamps was 1150 lb. The multiple-discharge mortar calls for an excess of water, but this is not a defect in a modern silver mill, owing to the fact that de-watering following the stamps is almost universal practice.

A noticeable feature has been the increased use of mechanical de-watering devices. Callow screens have been used to separate coarse material and de-water it after medium-coarse crushing from rolls or stamps. The increasing use of Dorr mechanical classifiers is noticeable, over 30 having been put into different mills during 1909. These machines consist of settling tanks with sloping bottoms equipped with rakes which serve a double purpose; the pulp is kept sufficiently agitated for the 200-mesh silver to be held in suspension and carried over with the water to the thickeners and on to the cyanide vats, while the coarse pulp is dragged out, de-watered, and is returned to the tube-mills for re-grinding. They increase the efficiency of the tube-mills by giving them a pulp of the required consistence and containing less slime.

Callow de-watering cones are also largely used as thickeners. In the latest plants air-agitation is generally adopted; 101 vats of the type known as Pachuca tanks having been erected in Mexico. In these plants, where the Pachuca tanks have been installed, decantation is hardly practised.

The extraction of the solutions is almost entirely dependent on Moore or Butters filters. Great improvements in details have been made in the Moore filters in the latest plants erected at Pachuca; these have been largely due to the efforts of White & Newcomb. One of the principal features introduced has been the addition of a vacuum reservoir-tank attached to each basket that 'holds' the vacuum while the connections are being broken and re-made, and the baskets being changed. Another valuable improvement is a new form of lever slip-coupling in place of the old screwed joint, for the vacuum connections. Several minor improvements have been made in the leaves, guides, and suspending mechanism; a knife-edge 'V' to the top of each leaf prevents the accumulation of slime and scum which was one of the principal sources of loss. One of the most interesting developments in vacuum filtering, and ore of purely Mexican origin, is the introduction of a new type of filter by Grote & Carter during the latter part of the year. This machine has an appearance not unlike the Ridgway filter. It consists essentially of a series of radial trays arranged about a central axis. The trays are about 4 in. deep and are equipped with filter-bottoms and vacuum-chambers under the filter. The trays are mounted on hollow trunnions and can be completely rotated. The vacuum-chambers connect, through the inner trunnion with radial pipes to the centre column and valve-system. Suitable stuffing-boxes and glands are provided. A large horizontal revolving spider carries all of the trays. The centre column is provided with suitable chambers, and a simple system of valves by which the period of vacuum-release and air-

pressure is applied to each tray as required. As the trays rotate slowly they pass under a pulp-feed distributer, and receive a charge. A short interval is allowed before applying vacuum, in which the coarser sand settles on the surface of the filter-cloth first and the lighter slime on the top. As the tray moves forward the vacuum is automatically applied, then follow weak solution and wash-water, with their respective vacuums. The tray then reaches a point where it discharges, this being effected by a simple tripping-gear which rotates the tray and turns it upside down at the same instant that the compressed air is applied by the central valve and the cake blown off. The tray then completes its revolution, is locked in position, and is ready for another charge and cycle of operations. This filter depends on gravity for the distribution of the pulp over the surface of the filter-canvas, and hence is adapted for coarse sand or for mixed and improperly classified pulp, but its area appears to be too limited for a slime-filter.

GOLDFIELD, NEVADA.

Combination Fraction.—Consolidated.—Florence.

An examination of the workings of the Combination Fraction by outsiders has been permitted by direction of George Wingfield. The present manager will be replaced on January 1 by Charles D. Wilkinson, formerly of the Daisy mine and at present on the engineering staff of the Consolidated Mines Co. No ore of commercial grade is being hoisted and there is not sufficient ore blocked to warrant starting the mill. The mine is now employing 30 men with five power-drills, and the work is confined to development, chiefly at the 500-ft. level.

The installation of additional equipment in the 100-stamp mill of the Consolidated Mines Co. is rapidly nearing completion and by January 1 the plant will be treating 900 tons per day. Early in January, according to the dip of the vein as indicated at levels above, the 1000-ft. west cross-cut should penetrate the vein at something over 500 ft. from the Clermont shaft. The Clermont orebodies are being developed by means of intermediate levels between the 600 and 900-ft. levels. At the 750-ft. level is the richest showing in the mine. The entire orebody samples $500 per ton for 25 ft. in width, and there are large bodies of good mill-ore near the walls. Drifts to the north from the vicinity of the Hampton stope have exposed large bodies of ore at the junction of the Combination and January veins.

The Florence has installed three additional electric transformers. The main shaft will be enlarged to the 500-ft. level and sunk to a depth of 1000 ft. While this work is in progress the mill will be supplied with ore from the Little-Florence lease workings and carried to the mill by aerial tramway. Stopes 12 ft. wide are being opened north of the main shaft toward the old Reilly workings at level No. 7, where good mill-ore is exposed for a distance of 500 ft. The mill is treating 150 to 160 tons per day of $25 ore, and 18 power-drills are being worked in the mine, of which three are sufficient to break ore for the mill.

The men who have secured the Gold Bar claim and workings of the C. O. D. Consolidated Co. under a five-year lease, will probably not begin active operations before the first week in January, when they will clean out the old workings and erect a higher head-frame from which the ore will be dumped directly into the bins of the 50-ton mill which they will build. Shipments of ore have been made recently from the MacKay lease on the St. Ives claim of the Merger Mines Co., from the Black Butte Consolidated, and from leases on the Daisy and Belmont. The Annex shaft on the Poleverde claim of the Jumbo Extension has passed the 750-ft. level. The Grizzly Bear shaft on the Jumbo is at about the same depth; three shafts on the Atlanta are below the 600-ft. level; the Mining & Ore Reduction Co. has resumed work on the Golconda claim of the Consolidated; the Thomas lease on Columbia mountain continues sinking its incline shaft on a good vein carrying a foot of shipping ore; the Lincoln Goldfield lease on the Combination No. 2 has begun development from the 600-ft. Moore shaft farther south; the Daisy is covered with actively working leases; the Golden Pick is exploring near the north line of the Combination.

Personal.

Professional men are invited to send news of their engagements and travels. Such news is interesting to friends.

F. L. Hess is at Los Angeles.

Whitman Symmes is in San Francisco.

Samuel Newhouse has gone to Paris.

Fred. H. Kay is examining properties in Mexico.

Charles Butters has returned to San Francisco.

C. B. Lakenan has returned to Ely from the East.

A. E. Drucker is on his way from London to San Francisco.

W. A. Prichard is spending the Christmas holidays in San Francisco.

Bailey Willis has returned to Washington from London and Paris.

Will C. Russell is manager for the Rawley Mining Co. at Bonanza, Colorado.

S. H. Ball has opened an office as consulting mining geologist at 71 Broadway, New York.

Frederick G. Clapp has recently been examining petroleum and natural-gas properties in Indiana.

Walter B. Raymond has returned to New York from an inspection of mines in the Western States.

Frank E. Pearce has been superintendent of the Iron Dike mine at Homestead, Oregon, for ten years.

F. M. Field is making a series of tests at the University of Utah in connection with his work for the Homestake mill at Neal, Idaho.

H. F. Evans has been appointed on the advisory board in the department of mining and metallurgy of the United States National Fair.

J. H. Burgin is superintendent for the Talbot Dyewood & Chemical Co. He was formerly connected with the Fresno Magnetic Co., of Fresno, California.

Clifford Wilfley has succeeded P. R. Whitman as superintendent of the cyanide mill of the Virginia & Mexico Mine & Smelter Corporation at Hostotipaquillo, Mexico.

James E. Chapman, formerly of the American Smelters Securities Co., is to become one of the members of the staff of the Cia. Minera de Real del Monte y Pachuca, Mexico.

H. R. Plate, who for two years has been manager for the Gunn-Thompson Co. properties in Ely, has severed his connection with them and will leave for New York the first of the year.

J. A. Taff has resigned from the United States Geological Survey and has accepted a position as geologist for the Southern Pacific railroad. His office is in the Flood building, San Francisco.

S. E. Bretherton has just returned from Mazatián, Mexico. He examined mining properties and made a successful smelting campaign for the Rey del Bismuto Co. near Culiacán.

T. W. Atterbury will leave the service of the Copper Queen Consolidated Mining Co., at Douglas, Arizona, at the end of the year. He made the general layout of the smelter over eight years ago, and has been in charge of the engineering office at Douglas since it was established. He will go East before taking another position.

The American Association for the Advancement of Science is meeting at Boston.

The Geological Society of America is meeting at Boston and Cambridge, Massachusetts.

The Montana Society of Engineers will hold its annual meeting at Helena the first week in January.

The Western Association of Technical Chemists and Metallurgists will hold its fifth annual meeting at Boulder, Golden, and Denver, on January 6, 7, and 8. It will include a number of trips to the laboratories of the State University and School of Mines, beet-sugar factories, smelters, and various industrial plants.

EDITORIAL.

FOLLOWING the centre of mining activity in New York, the MINING AND SCIENTIFIC PRESS has removed its Eastern offices to 42 Broadway, where it will be represented by Mr. F. S. Wayne, as in the past.

RECOGNITION should be given to the Geological Society at Stanford University as the body before whom the paper on 'Progress and Problems in Ore Dressing', by Mr. Courtenay De Kalb, printed in our last issue, was originally presented. The address was given only in abstract.

JOURNALISM, like other industries, tends toward specialization. Our esteemed contemporary, *Wood and Iron*, has for a long period been practically the exponent of the Western lumber interests. It has now ventured to claim that field by a frank change of name to *The Pioneer Western Lumberman*. The management remains unchanged, and publication will be made semi-monthly, as in the past.

ONCE MORE the North Star mine has given proof of undiminished vitality. A full account of the year's work will soon be published in these columns. It is gratifying to make an advance statement of earnings for 1909 exceeding $1,250,000, out of which dividends of 23 per cent on the capital stock have been paid. The company is mining to a depth of more than 5000 feet on the incline, and the ore shows an average assay value of about $12 per ton.

OWING to a large accumulation of articles dealing with the status of the mineral industry in 1909, it has been deemed advisable to omit the usual departments of Discussion and Concentrates from this issue. The discontinuance is only temporary. We value the open letters sent us as a reflex of current opinion on the leading problems which concern the mining world, and our desire is to encourage the custom among our readers of using our columns as an open forum.

CIVIL SERVICE protection has been extended to the Census Bureau, and this action has awakened fear in many quarters lest a high degree of training would be requisite to pass the 'test'. The Bureau has taken steps to give wide publicity to a contradiction of this impression. Anyone with an ordinary common school education, familiar with the three 'Rs', which have been the basal equipment of successful Americans for some generations back, may face the examination with smiling confidence. Applications must be on file with the supervisors in each district by January 25, and on February 5 the examinations will take place. Letters addressed

simply to the Supervisor of the Census, and bearing merely the number of the Congressional District and the name of the State, will be sent by your local post-master without more definite direction.

IN OUR issue of last week the dredge of the Nome Mining Company on Bourbon creek was referred to as of Bucyrus type. This is true only in the sense that it was an attempt to design along similar lines. The Bucyrus company, as it happens, had nothing to do with its building and is in no sense responsible for its defects, which seem to have been due to faulty construction and poor material rather than to the design. It need only be added that the discovery of this error is our own, and that the Bucyrus company has entered no complaint, which renders it all the more pleasant to make this correction.

DATA regarding ore deposits are becoming relatively abundant. Not long ago no such wealth of material was ready at the hand of the investigator. Mere facts, however, mean little. Correlation, analysis, and synthesis are as important as are the facts themselves. In this issue we publish the first of a series of articles in which Mr. T. A. Rickard brings together a great mass of material regarding the ore deposits of Colorado. The material is valuable, but even more so is the way it is brought together and the deductions Mr. Rickard makes. Perhaps there are errors, probably there will be some differences of opinion, but the articles are sure to be stimulating and helpful. They are based on personal observation, wide reading, and extensive correspondence, and are the fruition of many months of patient study. We only wish that similar studies of other areas might be made. One or two workers might well be spared to broader studies from the detailed investigation of districts and camps which have been so characteristic of American work on ore deposits.

California Eight-Hour Law.

Eight-hour legislation as a police measure has been upheld by the Supreme Court of California. This result we predicted in editorial comment shortly after the passage of the bill. The full text of the decision appears elsewhere in this issue. The mining interests of the State are certainly under obligation to Mr. Fred J. Martin, manager of the Utica mine in Calaveras county, for submitting to the inconvenience and sacrifice of time necessary to test the constitutionality of the statute. The matter was conducted in a decorous manner, and conclusively determines the law of the State on the three points at issue, which were, first, the constitutionality of the law considered as to discrimination between classes of persons and industries; second, whether the law contemplated eight hours of actual labor, or whether the time consumed going to and from work-places at mining plants should be included in the eight-hour period; and third, whether stamp-mills are embraced with the meaning of the term 'reduction works'. The decision denies that the law constitutes class legislation; declares that the statute requires eight hours of actual labor; and construes 'reduction-works' to include stamp-mills for the reduction of gold and other ores.

It must be observed that the authority cited by the court concerning class legislation is a previous decision by the Supreme Court of the State. This was a sufficient answer from a technical standpoint to a question that related to the interpretation of the constitution. Legislation is permissible in California regulating a group which is distinct in character, such as a well defined trade, or industries based upon fundamentally different resources or conditions, such as agriculture or mining. The case of City of Pasadena *v.* Stimson, to which reference is made, involved an attempt to discriminate between municipalities on the basis merely of difference in population. This was held invalid. So far as this portion of the decision is concerned it can hardly serve as a precedent of value in other States except where like constitutional provisions exist. In Colorado an act similar to the one enacted by the legislature of California was ruled out on the ground of unconstitutionality.

The California court has distinctly held that it is not enough to show that other occupations are equally unhealthy in order to impugn a statute as unjust class legislation. There is no reason to assume that the legislature may not protect workmen in other occupations likewise, and under the stimulus given by this decision of the Supreme Court a whole crop of special acts for the regulation of trades may be anticipated. It would seem that the end sought could be attained quite as well by a general statute, leaving the healthfulness of conditions as maintained at individual plants subject to inspection and control by officials of a suitably constituted bureau. The Supreme Court would have necessitated new and wiser legislation by less broadly interpreting the constitution. The act as it stands would have benefited by the criticism of the mining men of the State, which it certainly did not receive. All mines are not necessarily unhealthy, and reduction works may be made clean and free from dust or fume by the introduction of proper appliances. It is manifestly unfair to classify an industry as in itself prejudicial to health, when its undesirable features may be eliminated. If this is not class legislation it comes so near the border line as to create a precedent fraught with possibilities of evil. A petition for re-hearing of the case has been filed, asking for review of this portion of the decision. It would be pleasing to see the Supreme Court bridle the legislature by curtailing that unlimited power to affect classes and special industries which the decision just rendered will be construed as conceding.

Petroleum Production.

The petroleum production of the United States now amounts to approximately 175,000,000 barrels per year. In 1908 it was 179,572,479, but in the last year a decrease occurred. It sells for $125,000,000 to $130,000,000 per year, ranking in total value next to coal and pig iron, and equaling, for example, the combined value of the gold and silver output of the country. Nevertheless, the production of oil is a new industry. It is within a year that the semi-centen-

nial of the drilling of the Drake well at Titusville, Pennsylvania, was celebrated, and the three most productive fields in the United States, those of California, Oklahoma, and Illinois, only became important producers in 1900, 1905, and 1907 respectively. For many years the Appalachian region, including at first only Pennsylvania and New York, but later Ohio and West Virginia, were the main sources of supply. The Pennsylvania-New York field reached a production of 30,000,000 barrels in 1882, and a maximum of 33,009,236 in 1891. Since that year they have steadily declined. West Virginia produced 16,195,676 barrels in 1900, but has since declined to less than 10,000,000. Ohio ran up to nearly 24,000,000 in 1896, the Lima field being then important, but it now produces little more than West Virginia. In a general way the Eastern States were thought to contain the most important oilfields up to 1901, when the great Lucas well at Spindle

Gold Production in California, 1849 to 1909, in Millions of Dollars Compared with Petroleum Production, 1876 to 1909, in Millions of Barrels.

Top in Texas, and the rapid increase in California production, attracted renewed attention to the West. Since then the California output has exceeded most sanguine expectations, amounting to over 57,000,000 barrels in 1909. At the same time the Oklahoma field has proved embarrassingly rich, the output in 1909 amounting to 46,535,613, more than could be properly cared for, as shown by Mr. L. L. Hutchison, of the Oklahoma Geological Survey, in this issue. The whole Illinois production has also been developed. Mr. R. S. Blatchley estimates the output of the latter State in 1909 at 29,700,000 barrels. We believe this to be a little low, since, in addition to the pipe-line runs of the Ohio company and the tank-car shipments, allowance should be made for the oil handled by the new Tidewater line. Since this has been estimated as high as 8000 barrels per day for part of the year, it is evident that something may safely be added to Mr. Blatchley's figures. However, the pre-eminence and relative rank of the three great producing States, California, Oklahoma, and Illinois, are likely to stand.

In California the oilfields furnish now the greatest single item in the mineral output. And yet these fields were for many years condemned as probably worthless because of the 'low grade' of the oil and an alleged lack of cover. How groundless were these fears is shown by the curve of production above.

For the sake of comparison the gold production of the State is sketched on the same diagram. It should be remembered that the comparison here is between rates of production and not between absolute values. To make the latter hold it would be necessary to assume that the oil had heretofore sold for $1 per barrel, which is far from true. The gold-production curve, it will be noted, swings suddenly and sharply upward, and with the prompt working out of the rich placers drops down at a rapid but somewhat less pronounced rate. As the industry became firmly established, quartz mining began, and methods of exploration and mining adapted to the territory were developed, the line ceased to drop and became roughly horizontal. The oil-production curve shows the industry still to be in the first stage. Indeed, it is a characteristic production-curve for a young industry, and corresponds to one representing the portland cement industry in the United States beginning with 1895. The early years of the Klondike and of Cripple Creek yield similar production-curves. So far the situation is most hopeful.

Predictions regarding oil production are notoriously uncertain, and only most general statements may be ventured. There is, however, a growing conviction among those who have watched the development of the territory that the areal limits of the oilfields of the State are now mainly ascertained. It is not to be expected that the formations which have proved so productive in the southern counties will show equally rich in the central and northern parts. Doubtless some additional fields will be found and the limits of the present pools are by no means known. Depth, however, imposes difficulties and costs which must ultimately prevail. It is not likely that 'mile-deep' wells will become common, even in such rich territory as California. Water, another limiting factor, may be overcome, at least in part, as has been shown this year in the Summerland field. Yet it is the almost universal rule that in the end the water prevails. Care in drilling, casing, and plugging wells is effective in combating it, but complete success is contingent on vigilance and co-operation which is not to be expected in an industry where so many individuals and companies are all dipping soup from one tureen. Mr. Ralph Arnold has estimated for the Conservation Commission that 8,500,000,000 barrels of petroleum were originally stored in the rocks of the State, and that of this, 5,000,000,000 might be expected to be produced. To date the total yield has amounted to 259,000,000 barrels, so that on the basis of Mr. Arnold's estimates, a considerable amount remains to be drawn. The quantity is, however, fixed. The amount of oil in the rocks is decreasing and not increasing, and its importance to the industries of the Pacific Coast demands that intelligent care be taken in its production and use to keep the waste down to its possible minimum.

FUTURE OF COPPER.

Written for the Mining and Scientific Press
By James Douglas.

It is possible that we in this country feel so sure of our present commanding position in the copper markets of the world that we do not attribute sufficient importance to what the world at large is doing and may do. Looking backward is often salutary, and a retrospect, if we read history aright, may enable us to make correct anticipations. Looking back to the beginning of the last century we find that for the first half Great Britain took the lead as a copper producing country, making about 40% of the world's total. Chile, however, kept creeping up into prominence, and when the century had half expired Chile stood first on the list, and retained that position until the seventh decade, after which the yield of the Rocky Mountain mines in Arizona and Montana gave the United States pre-eminently the first place. The contribution of Chile, with a small addition from Bolivia between 1871-1880, was 483,300 tons, as against 186,400 in the United States, whereas during the eighth decade the west coast of South America had declined to 368,300 tons, and this country had risen to 730,750. Great Britain meanwhile had sunk into insignificance. The production of her mines shrunk during the eighth decade to only 21,300 tons (which had yielded in the third decade 144,000 tons.*

Great Britain can never attain high rank, with production on the scale of today, as her mines, besides having been stripped of their richer ores, are included in a limited area of South Devonshire, Wales, and Cornwall, the copper yield of the Wicklow pyrites being negligible. But Chile, Bolivia, and Peru have resources of incalculable extent. Chile's production attained its zenith in the early seventies, when her mines yielded over 50,000 tons. This came almost exclusively from the districts of Tamaya, Carrizal-Alto, and Chañaral, with small quantities of argentiferous copper from the Copiapó. They mined only the richer ore, extracted from comparatively shallow depths. The cost of mining and smelting with dear coal in reverberatory furnaces of small size was high, and has remained so ever since. But Chile's coal mines, in the southern provinces, have of late undergone rapid development: petroleum discoveries on the west coast have been made, and above all, the contagion of our success in working low-grade porphyries will extend, and when it reaches there, low-grade ore will be developed in abundance sufficient to keep both company mongers and metallurgists busy.

The interior of Bolivia and Peru will not yield their mineral treasures until railroads reach them. The sandstones that have for a century yielded the copper *barrilla* (metallic copper) which has been shipped in small quantities from Arica, after transportation over 200 miles by mule and rail, extend for some 300 miles from Corocoro in Bolivia to San Pedro de Atacama in Chile, will in time duplicate the production of our Lake Superior mines.

What Peru may do can be imagined from the brilliant results of working the copper ores at Cerro de Pasco which underlie the silver ores of that famous region. Next year the furnaces at Tinyahuarco promise to turn out 60,000,000 lb. of copper.

The production of Mexico, like our own, has grown with the progress of railroad building, and has expanded from less than a thousand tons 30 years ago to over 60,000 tons at present. Canada also owes her position to the assistance of railroads. The maritime Provinces have never produced copper in any quantity, and though the Province of Quebec in the sixth decade figured more conspicuously in the number of companies organized than in the quantity of copper produced, she has not maintained her early output. Ontario in the same period appeared as a notable producer of copper from the Bruce mine, on the north shore of Lake Huron, but it was not till the Canadian Pacific cut away from the river and the lakes and opened up the interior that Sudbury was discovered, and subsequently the copper mines of the Boundary District of British Columbia were made accessible. But these discoveries have been made on the mere fringe of a territory which covers half the continent. Twenty-five years ago, before the development of the Sudbury mines, Canada made only about 1,000,000 lb. of copper per annum; last year she made 64,000,000.

Looking to the other hemisphere, we find even more unexplored and undeveloped territory than in the Western World. The Cape Copper Co., from its mines in Namaqualand, in Cape Colony, has maintained a small but steady yield since its organization in 1888; but both it and the copper mines in the adjacent German territory lie close to the coast. The vast interior of the continent is to the miner almost an unknown land. Some small mines have been opened in South Rhodesia, and we are soon to know whether the promises made of great production from the Tanganyika Concessions, and from the Katanga District of the Congo Free State, are to be realized. Within less than a twelve month a branch of the Cape to Cairo railroad will have been completed. From the report of the Tanganyika Concessions, Ltd., recently issued, I make the following extracts: "Messrs. Pauling & Co. have kept well up to their promise to be at the Star mine 18 months after starting work. In seven months they have accomplished 140 miles of running line and 20 miles more of earthworks, and Mr. Pauling says that, given a fairly accommodating wet season, he will be at the Star mine next June, instead of October as expected. With regard to the Union Miniere company, in which the Belgians own 55% and we own 45: The work at the Star mine and smelter is being equally rapidly pushed forward, and Mr. Gibb reports that in 12 months we should be ready to produce 2500 tons of copper per month."

The Kansanshi mines also promise speedy returns and the predictions are not as vague as those heretofore made. The same report says: "With regard to the Rhodesia-Katanga Railway Co., at Kansanshi mine, we have been producing copper bars containing 96% of copper direct from the small furnace.

*I take these totals from Brown & Turnbull's very useful 'A Century of Copper'.

There are 1000 tons of these bars now, and we will have about £90,000 to £100,000 worth of them on the railway in April or June next. The first shipment by rail will represent in value more than the entire money spent on the mine since it was discovered, including the cost of making the copper. Mr. Thomson, the manager of the Kansanshi, is enlarging the present furnace, and the shipments will come regularly and increase steadily from this mine until they are followed a little later by 2500 tons monthly from the Katanga mines."

In Asia are vast areas of unexplored territory, and in Australia old mines are being reopened, where our experience in working low-grade ores will be repeated. Meanwhile it must not be forgotten that we have not opened a large high-grade mine except North Butte since the Iron Mountain, in 1894, and that nearly all our old high-grade mines must now be classed as low-grade. To extract the copper from the new avowedly low-grade deposits, even with improved methods, will cost more than the old standard, and the same will become increasingly true of the working of these same low-grade ores as depth is attained. Percentages will fall off, and all the contingencies which accompany either large surface openings or greater depth must be met; and these contingencies will have to be encountered in the face of a larger foreign production. To successfully overcome these difficulties without losing our standing among the world's producers will require skill, discrimination, business ability, and some moderation in output.

LEAD PRODUCTION IN 1909.

Figures showing the production of refined lead in 1909, compiled by C. E. Siebenthal, of the United States Geological Survey, from reports and estimates made by the desilverizers and the soft-lead smelters, are believed to show approximately the actual output within 1%.

The total production of refined lead, desilverized and soft, from domestic and foreign ores in 1909 was approximately 444,363 short tons, worth at the average New York price $38,215,000, as compared to a production of 396,433 tons in 1908 and 414,189 in 1907. These figures do not include an estimated output of 12,860 tons of antimonial lead, as against 13,629 in 1908 and 9910 in 1907. Of the total production, desilverized lead of domestic origin, exclusive of desilverized soft lead, is estimated at 209,698, as against 167,790 tons in 1908; and desilverized lead of foreign origin comprised 87,379 tons, compared to 97,761 in 1908. The production of soft lead from Mississippi Valley ores is estimated at 147,286 tons, as compared with 130,882 in 1908 and 129,607 in 1907. Missouri apparently retained first place among the lead-producing States.

There was a slight increase in the imports of lead in ore and base bullion, which amounted to 112,467 tons, valued at $4,210,829, as compared to 109,287 in 1908. Of the 1909 imports, 90% came from Mexico. The imports of refined lead increased slightly, being 3588 tons, with a value of $230,956, against 2759 in 1908. The exports of foreign lead (lead of foreign origin smelted or refined in the United States) show an increase of 16%, being 88,794 tons, valued at $3,221,836, compared to 76,367 in 1908. The exports of lead manufacturers decreased slightly, having a value of about $530,000, as compared to $599,640 in 1908. The price of lead started in January with an average of 4.2c. per lb., falling in March to the minimum for the year, 3.95c., then rising slowly to the close of the year. The average New York price for the year was 4.3c. per pound.

PRODUCTION OF COPPER IN 1909.

Statistics and estimates received by the United States Geological Survey from all plants known to produce blister copper from domestic ores and from all Lake mines indicate that the copper output from mines in the United States in 1909 surpassed all previous records.

The figures, which have been collected by B. S. Butler, of the Survey, represent the actual production of each company for 11 months and include an estimate of its December output. The November figures for a few companies were not available and these companies furnished estimates for the last two months of the year. On this basis the output of blister and Lake copper was 1,117,800,000 lb., as against 942,570,721 in 1908, an increase of over 18%. This not only exceeds the increase of any previous year but it is considerably greater than the total yearly increase since 1904.

It is impossible now to give figures that represent accurately the distribution of the output among the States, but Montana shows a large increase, again taking first rank, a place lost to Arizona in 1907. The production in Montana will nearly equal or will possibly exceed the State's previous record output, 314,750,000 lb., made in 1905. Arizona holds second place, with a slight increase over the 289,523,000 lb. produced in 1908. Michigan also exceeded the 1908 production, 222,289,000 lb. Large gains were made by Utah and Nevada, and California also increased its output considerably.

Figures published by the Copper Producers' Association indicate that the production of marketable copper from all sources, domestic and foreign, for the first 11 months of 1909 will exceed 1,400,000,000, as against 1,161,176,085 lb. in 1908. Statistics showing domestic deliveries for the first 11 months of the year indicate a consumption of copper in the United States considerably greater than the previous record consumption—682,000,000 lb. in 1906.

The exports of copper will surpass by several million pounds the exports for 1908—661,876,127 lb. According to the Bureau of Statistics, imports of pigs, bars, ingots, plates, and old copper for the first 11 months amounted to 213,100,281 lb., and the copper content of ore matte and regulus imported amounted to 74,708,482 lb. If the imports for December were equal to the average monthly import for the first 11 months the amount of copper entering the United States for the year was about 311,800,000 lb., as against 218,705,487 lb. in 1908.

Stocks of refined copper in the United States show a considerable increase over those of January 1, 1909, but the accumulation occurred for the most part during the first half of the year. European stocks, how-

ever. have increased rather uniformly throughout the year and at the close were probably nearly double those of January 1. 1909. The price of copper has remained close to 13c. throughout the year, the average monthly New York quotation for electrolytic copper being a little under 13 cents.

SPELTER PRODUCTION IN 1909.

A statement just issued by the United States Geological Survey shows that the zinc industry in 1909 had a year of unexampled expansion. Not only was the largest output of spelter ever made in the United States almost completely absorbed by the market, but the imports of spelter were much larger than ever before. A record-breaking production of zinc ores in the Joplin and Upper Mississippi Valley regions and from the Franklin Furnace mines of New Jersey is indicated. The following figures have been compiled by C. E. Siebenthal from reports furnished by all operating zinc smelters, based on their output for the first 11 months of the year and their estimated production in December, and are confidently believed to be within 1% of the actual output. Figures showing the imports and exports were obtained from the records of the Bureau of Statistics, likewise with estimates for December.

The production of primary spelter from domestic ore in 1909 is estimated at 241,842 short tons, and from foreign ore at 26,373, a total of 268,215, worth $28,967,226, as compared to 210,424 tons in 1908 and 249,860 in 1907. The production of spelter from both domestic and foreign ores, apportioned according to the States in which smelted, was approximately as follows: Illinois, 76,486 tons in 1909, as compared to 50,244 in 1908; Kansas, 104,007 in 1909 and 99,298 in 1908; Missouri, 8479 in 1909 and 10,201 in 1908; Oklahoma, 28,821 in 1909 and 14,864 in 1908; Eastern, Western, and Southern States, 50,422 in 1909 and 35,817 tons in 1908. The total production of spelter is equivalent to the output of 56,112 retorts operating continuously through the year, or 60% of the total smelting capacity.

The imports of zinc ore exceeded all records, being approximately 116,173 short tons, valued at $1,381,836. Of this amount 91%, or 105,600 tons, was from Mexico, more than double the quantity imported in 1908, which was 53,757 tons, and even more than the quantity imported in 1907, which was 103,117 tons. The exports of zinc ore show a decrease, being 12,456 short tons, worth $412,300, compared to 26,108 tons in 1908. The imports of spelter show a remarkable increase, being approximately 10,961 short tons, worth $947,196, compared to 881 tons in 1908. The exports of spelter fell off slightly, being 2487 tons, as against 2648 tons in 1908. The exports of zinc dross were 7306 tons, valued at $494,158, compared to 8405 tons in 1908.

The apparent consumption of spelter in 1909 may be calculated as follows: The sum of the stock on hand at the smelters at the beginning of the year, 19,622 tons, plus the imports, 10,961, and the production, 268,215, gives the total available supply, 298,798 tons. From this there is to be subtracted the exports, 2487 tons, and the stock on hand at the smelters at the close of the year (to be exact, on hand December 15), 10,546, a total of 13,033, leaving a balance of 285,765 tons as the apparent consumption. This calculation takes no account of the stocks of spelter held by dealers for speculative purposes. On comparing the consumption in 1909 with the 215,401 tons in 1908, the 228,524 in 1907, and the 220,781 in 1906, it seems probable that considerable stocks are held by dealers. Spelter opened at St. Louis in January at 5c. per lb., but dropped to 4.52c. late in February. A gradual rise carried prices up to 6.27c. near the close of the year. The average St. Louis price of prime western spelter for the year was 5.4c. per pound.

FERROUS IRON IN MINERALS.

*Decomposition of a mineral with the aid of HF and heat is readily accomplished, but the HF interferes decidedly with the permanganate titration. To expel it requires much time, with great danger of oxidation of the FeO. The author has found that the interference may be obviated by addition of calcium phosphate just before titration. The calcium phosphate solution is prepared by suspending 5 gm. $CaCO_3$ in 50 c.c. of water, and adding 10 c.c. (85%) of orthophosphoric acid slowly with stirring. This amount was found to suffice in the treatment of 0.5 gm. of magnetite. Take 0.5 gm. of the magnetite or other mineral weighed out in a 50-c.c. platinum crucible, moistened with water, coils of fine platinum wire introduced to prevent bumping, and then add a cold mixture of 10 c.c. HF and 15 c.c. H_2SO_4 (1 : 3). The close-fitting cover is then put on, and the crucible placed in a hole in an asbestos board, which is of such size that the crucible rests in it when about half way down, fitting closely. Over this is put a 6-in. paraffined funnel, the stem of which is connected with a CO_2 apparatus. The rim of the funnel should fit closely against the asbestos board. Pass in a strong stream of CO_2, and then in a few minutes apply the heat of a burner to the crucible, regulating it so as to quickly bring the content to boiling, and after that to keep it boiling gently. Apparently the point at which the treatment can be safely stopped must be judged by experience; ordinary rocks require about 5 minutes. Magnetite and other minerals may require a little longer. Remove the burner, and when the steam has condensed lift the crucible (still covered) by the aid of a loop of stout platinum wire (previously adjusted) and plunge it at once in 400 to 500 c.c. of cold water in a beaker. When ready to titrate upset the crucible in the beaker, stir, then add the calcium phosphate solution, and proceed to titrate. The first permanent color is to be taken as the end-point, though it may fade in a short time. A blank determination should be run, and the corresponding correction made.

Stockholders in mining companies are not co-owners with the corporation or the other stockholders within the meaning of law referring to forfeiture of interest for failure to do or to contribute to the doing of assessment work.

*Abstract by Elwyn Waller from *Jour.* Am. Chem. Soc. XXX.

GEOLOGICAL DISTRIBUTION OF THE PRECIOUS METALS IN COLORADO.—I.

Written for the MINING AND SCIENTIFIC PRESS
By T. A. RICKARD.

In a previous article[1] I presented some general conclusions regarding the geological distribution of the precious metals, stating that in Colorado, for example, the occurrence of gold and silver ores was dependent upon structural and thermal conditions, identified with the eruptive activity that was manifested at the end of the Cretaceous and the beginning of the Tertiary period. The irruptive[2] rocks associated with the precious-metal deposits of Colorado are of post-Cretaceous and pre-Pliocene age, and this is true notwithstanding the fact that the Tertiary volcanics and their associated ore deposits traverse rocks belonging to all the sub-divisions of geological time. Profitable mining for gold and silver has been performed in formations belonging to every division of geological time from the Tertiary to the Archaen, and in every kind of rock from the simplest sedimentary to the most complex crystalline. The only condition uniformly prevalent is the vulcanism that supervened at the close of the Cretaceous, as now manifested in the form of dikes, sills, and cores of igneous rock of varying composition.

The accompanying table tells the story. This summary of the evidence collected by me in the course of professional work in Colorado, gives the names of 650 mines, all of which are assigned to their proper geological horizon. Eighty mining districts and sub-districts are specified and, taken as a whole, the table affords emphatic evidence of the wonderful distribution of the precious metals in that portion of the Rocky Mountain region. A suitable description of the various districts, with reference to the mines mentioned, was prepared by me five years ago and it was made ready for publication a couple of weeks before the earthquake-fire that devastated San Francisco. Among the many papers not possible of replacement that were destroyed on April 18, 1906, was the one intended to add to the usefulness of this list of Colorado mines. It went up in smoke, but the list itself, most fortunately, was at my home at Berkeley and so escaped the destruction that befell everything at the office in San Francisco. The fact that the tabulated statement was prepared five years ago will explain the omission of mines that may have won prominence since then, but this is of no moment, for there is no intention of presenting a directory of good mines in Colorado; the list is for the mining geologist and not for the promoter or even the speculator; it is merely a systematic effort to bring out a dominant fact in the study of ore deposits in Colorado.

It will be necessary to give an outline of the geological conditions suggested by the petrography and stratigraphy—the kind and age—of the rocks mentioned in connection with the different districts, and as any such description will lack the life of the one that was burnt, it is presented with an apology.

The youngest rocks in which gold or silver have been found in Colorado are, naturally, the Tertiary eruptives immediately associated with the origin of precious-metal deposits all over the State.[3] The first eighteen occurrences are all in the volcanic complex due to the successive periods of volcanic activity that are responsible for the distinguishing features of the Cripple Creek, Silver Cliff, and San Juan mining districts. Hahn's Peak (19) belongs to the same period but is a northern area, separate from the districts mentioned and unlike them in many respects.

The youngest rock in which precious-metal mining has been done is the diorite of the San Juan. At Ophir, Mt. Wilson (1), and in the La Plata mountains (2), this rock appears as a quartz-bearing augite-diorite, passing on the one hand to a granitic phase and on the other to a gabbro. This rock is usually porphyritic. Irregular veins of ore are found traversing the big stocks or cores of this rock, and when they extend out of the diorite into the surrounding sedimentary formation, such as Mancos shale (Cretaceous), the orebodies are less profitable (24). The diorite is probably Miocene. In the La Plata mountains the precious metals occur in the form of tellurides, chiefly petzite and hessite. Displacements are frequent; they are more in the nature of a shifting along the lines followed by the ore than regional faults. In many cases the quartz veins are economically less important than the impregnation of the diorite itself.

At Silver Cliff and Rosita (3) the evidence of geologically recent vulcanism is marked. The Bassick orebody is a chimney occupying the neck of a vent, and the ore itself consists of rounded fragments of andesite representing a phase of volcanic eruption. Fumarolic action is evident.[4] The Bull-Domingo is a similar chimney of ore, but in this case the vent is in ancient granite, while at the Bassick it is in igneous rocks only less recent than the outlet itself. Other mines in the same district, such as the Silver Cliff itself, yielded rich silver ore from a rhyolite flow covering tuff and breccia. This ore was quarried in large quantities, and some shipments were also made subsequently from a depth of 2100 ft. in the Geyser mine, which follows a fissure penetrating both the tuff and the underlying granite. The Pocohontas and Humboldt veins follow fault-planes in the igneous rocks that outcrop in this district, remarkable for long-continued volcanic action on a small scale. Fossil leaves fix the age of the rhyolite as early Eocene.

Next we come to the great area of volcanic ejectamenta out of which the mountains of the San Juan region have been sculptured. This forms the southwestern part of Colorado and is a rough country famous for rich mines. The mountains reach an altitude of 14,000 ft. above sea-level and their topmost 5000 ft. consists of eruptive rocks, mainly breccia and lava. The earliest extrusion was an andesite breccia, which was deposited to a thickness of 1500 ft. and covered the territory included within the

[1] MINING AND SCIENTIFIC PRESS, October 20, 1906.
[2] Eruptive rocks are those that have broken out from vents and covered the surface. Irruptive rocks invade and break into the formation without necessarily reaching the surface.

TABLE ILLUSTRATING THE GEOLOGICAL DISTRIBUTION OF THE PRECIOUS METALS IN COLORADO.—By T. A. RICKARD.

PERIOD.	ROCK.		LOCALITY.	REPRESENTATIVE MINES.
Tertiary	Diorite or monzonite	1	Ophir and Mt. Wilson	Carribeau, Montezuma, Butterfly, Terrible, Silver Pick, Silver Bell, Butler.
"	Diorite porphyry	2	La Plata Mountains	Columbus, Little Kate, Small Hopes, Jenny Lind, Mountain Lily, Tip Top, Durango Girl.
"	Andesite agglomerate and rhyolite	3	Silver Cliff and Rosita	Bassick, Humboldt, Pocahontas, Virginia, Hector, Geyser.
"	Andesite breccia and rhyolite	4	Summitville	Golconda, Little Annie, Aztec, Bobtail, Little Ida, Morse, Major, Treloar.
"	Rhyolite	5	Creede	Amethyst, New York, Last Chance, Bachelor, Commodore, Happy Thought, Park Regent.
"	Andesite and andesite breccia	6	Red Mountain	Guston, Yankee Girl, Congress, National Battle, Gennessee-Vanderbilt, Barstow.
"	Andesite and latite	7	Engineer Mtn	San Juan Chief, Frank Hough, Polar Star, Banner, Palmetto, Manhattan, Old Lout.
"	Andesite breccia	8	Ophir	Suffolk, Alta, Bessie, Gold King, Summit, Palmyra.
"	Andesite breccia	9	Mt. Sneffels, Ouray	Camp Bird, Yellow Rose, Virginius, Terrible, Humboldt, Trust Ruby, Atlas.
"	Andesite breccia	10	Telluride	Smuggler-Union, Tomboy, Argentine, Cimarron, Valley View, Japan, Columbia.
"	Andesite breccia and rhyolite	11	Silverton	Silver Lake, North Star, Iowa, Titusville, Sunnyside, Mastodon, Ridgway, Aspen.
"	Andesite breccia	12	Cement Creek, Silverton	Grand Mogul, Gold King, Nathalie, Henrietta.
"	Andesite breccia	13	Lake City, Hinsdale	Golden Fleece, Ute & Ulay, Hidden Treasure, Lily, Hondee.
"	Nepheline basalt and breccia	14	Raven Hill, Cripple Creek	Elkton, Moose, Tornado, Raven, Bertha, Ingham, Ida May.
"	Nepheline syenite and breccia	15	West Cripple Creek	Vindicator, Lillie, Independence Consolidated, Longfellow, Christmas.
"	Trachytic phonolite and breccia	16	Bull Hill, Cripple Creek	Victor, Isabella, Pharmacist, Orpha May, Golden Cycle, Zenobia, Lucky Gus.
"	Andesite breccia and phonolite	17	Battle Mtn., Cripple Creek	Independence, Portland, Last Dollar, Modoc, Rigi.
"	Andesite and breccia	18	East Cripple Creek	Anaconda, Moon-Anchor, Gold King, Anchoria Leland, Mary McKinney.
"	Trachyte	19	Hahn's Peak	Tom Thumb, Southern Cross, Royal Flush, Imperial, Minnie D.
"	Conglomerate	20	Bear Creek, Telluride	Contention, Champion.
"	Conglomerate	21	Silver Mtn., Ophir	Osceola, Golden Crown, Red Jacket, Winnemucca, Attica.
Cretaceous	Sandstone, shale, and conglomerate	22	Irwin, Gunnison	Forest Queen, Ruby King, Mountain Gem, Bullion King, Ruby Chief, Monte Cristo.
"	Sandstone and shale	23	Ruby Range	Augusta, Domingo, Richmond, Elkton, Painter Boy, St. Elmo.
"	Shales	24	Mt. Wilson	San Bernardo, Magpie, Morning Star, Belcher.
"	Shales	25	Farncomb Hill, Breckenridge	Ontario, Key West, Bow, Carpenter, Gold Flake, Grattan, Bondholder.
"	Quartzite	26	Hahu's Peak	Hidden Treasure, Minnie D., Independence, Good Thunder, Dead Shot.
"	Sandstone	27	Gold Hill, Ouray	American Nettie, Octoroon, Wedge, Bachelor, Khedive, Calliope, Iowa Chief.
Jurassic	Sandstone and shale	28	San Miguel	Allegheny, Crescent, Wonder.
"	Limestone and sandstone	29	Sawpit, San Miguel	Corbett, Lizzie G., Belle Champion, Commercial, Nancy Hanks.
"	Limestone and sandstone	30	Gold Hill & Camp Paquin, Ouray	Bright Diamond, Ironclad, Pony Express, Slide, Newsboy, Black Girl, Portland.
"	Sandstone	31	La Plata Mountains	Century, North Star, Georgia Girl.
Triassic	Sandstone	32	La Plata Mountains	Baker Contact, Cumberland, Snowstorm, Eureka, Eagle Pass, Gold Bug, Mammoth.
"	Sandstone	33	West Gold Hill, Ouray	Speedwell, Grand View, Gray Eagle, Plutus, Sampler.
"	Sandstone and shale	34	Bear Creek, Telluride	Silver Chief, Silver Glade, Canton, Northern Ohio, Badger.
"	Limestone and sandstone	35	Kokomo, Ten Mile	Queen of the West, Mayflower, Clara, Little Rex, Enterprise, Morning Star, Delmonico.
Permian	Sandstone and sandy shale	36	Rico	Pittsburgh, Cobbler, Butler, Phœnix, Grand View, Alma Mater.
Upper Carboniferous	Limestone	37	Robinson, Ten Mile	Robinson, Big Giant, White Quail, Milo, Badger, Snowbank, Selma, Free American.
"	Limestone	38	Pitkin	Maid of Athens, Cleopatra, Fairview, Silent Friend, Courtland.
"	Bituminous limestone	39	Rico	Logan, Princeton, C. H. C., Wellington, Pigeon, Quebec, Wabash, Sambo.
"	Limestone and shale	40	Newman Hill, Rico	Enterprise, Rico-Aspen, Swansea, New Year, Blackhawk, Union Carbonate, Iron.

Lower and middle Carboniferous	Limestone and shale	41	Smuggler Mtn., Aspen	Mollie Gibson, Smuggler, Della S , Park-Regent, Bushwacker, Mineral Farm, Alta-Regent.
Lower Carboniferous	Limestone and dolomite	42	Aspen Mtn., Aspen	Argentum-Juniata, Spar, Emma, Aspen, Durant, Schiller, Bonnybel.
"	Limestone	43	Gothic	Moss Rose, Sylvanite, Virginius, Silver Queen, Iron Duke.
"	Limestone	44	Mt. Lincoln	Dolly Varden, Fanny Barret, Moose, Present Help, Russia, Sunflower.
"	Limestone	45	Battle Mtn., Redcliff	Iron Mask, Belden, Ben Butler, Kingfisher, St. Joe, Eagle Bird, Belcher, Crown Point.
"	Dolomitic limestone	46	Leadville	Small Hopes, Crysolite, Little Pittsburg, Robert E. Lee, Morning Star, Wolftone, Matchless, Iron Silver, Ibex.
Devonian	Limestone	47	Ironton, Ouray	Saratoga, Mono, Brooklyn, Baltic, Albany, Maud S, Mineral Farm.
"	Quartzite	48	Leadville	Colorado No. 2, Louisville, Pyrenees, Rubie.
"	Limestone	49	Dolores Valley	Atlantic Cable, Riverside, Smuggler.
Silurian	White limestone	50	Leadville	Maid of Erin, Adams, Wolftone, Mahala, Mikado, Greenback, R. A. M.
"	Dolomite	51	Gold Hill and Tin Cup	Jimmy Mack, Gold Cup, Silver Cup, Carbonate King and Queen, El Capitaine.
Cambrian	Quartzite	52	Battle Mtn., Redcliff	Ground Hog, Polar, Rocky Point, Star of the West, Percy Chester.
"	Quartzite	53	Leadville	Maid of Erin, Adams, R. A. M.
"	Quartzite	54	Alma	Orphan Boy, Paris, Eureka, Sovereign, Gold King.
"	Quartzite	55	Upper Blue River	Phillips, Ling, El Dorado, Vanderbilt, Monte Cristo.
Algonkian	Granite	56	Squaw Mtn., Cripple Creek	Strong, Gold Coin, Granite, Dead Pine, Ajax, Dillon, Coriolanus.
"	Granite	57	Beacon Hill, Cripple Creek	El Paso, Kimberley, Orizaba, Prince Albert, Little May.
"	Hornblende schist	58	Silverton	Highland Mary, Green Mtn., Ureteba, Powder House.
"	Schist and quartzite	59	Bear Creek, Needle Mts	Gold Bug, Good Hope, Sylvanite, New York, Brooklyn, Silverton.
"	Mica schist	60	Vulcan, Gunnison	Good Hope, Vulcan, Mammoth-Chimney.
"	Gneiss and actinolite schist	61	Salida	Sedalia, Gypsy Queen, Cotopaxi, Copper King.
"	Hornblende schist and quartzite	62	Crestone	Independent, Cleveland, Bonanza, Cashier, Shah of Persia, Alamosa.
"	Hornblende schist	63	Ohio Creek, Gunnison	Sacramento, Corydon, Soft Snap, Toronto, Montreal.
"	Hornblende schist	64	Costilla	Hamilton, Honest Abe, Evangeline, Hawkins, Little May.
Archean	Granite	65	Mt. Massive	Denero, Virginius, Tiger, Orinoco, Buckeye, Homestake, President.
"	Granite-gneiss	66	Monarch	Vivandiere, Eclipse, Kadish, Independence, Nick Warren.
"	Granite	67	St. Elmo	Mary Murphy, Nellie Bly, Pawnee, Pat Murphy, Blackhawk, Waupaca.
"	Gneiss and granite	68	Southern Gunnison	Old Lot, Mineral Hill, Iron Cap, Ute Trail, Champion.
"	Granite	69	Burroughs Park	Monticello, Cleveland, Cashier, Bon Homme, La Belle.
"	Granite	70	Needleton	Ajax, Apache, Norch, Mastodon, Emerald Lake.
"	Protogine granite	71	South Boulder	Yellow Pine, Logan, Hoosier, Kekionga, Mountain Lion, Keystone.
"	Gneiss and granite	72	Caribou	Caribou, No Name, Poorman, Boulder County.
"	Protogine gneiss	73	Eldora	Enterprise, Village Belle, Revenge.
"	Gneiss and mica schist	74	Ward	Ni Wot, Columbia, Utica, Morning Star, B. & M., Dewdrop, Texas.
"	Protogine gneiss	75	Gold Hill and Sunshine	Slide, Horsefall, Red Cloud, Grand View, Emancipation, Melvina, Ingram.
"	Granite and gneiss	76	North Boulder	Golden Age, Longfellow, Smuggler, John Jay, Bueno, Nugget.
"	Granite	77	Twin Lakes	Gordon, Bengal Tiger, Kearsarge, Terrible, Belle of Granite, Grit, Magenta.
"	Granitoid gneiss	78	Silver Plume	Pelican-Dives, Seven Thirty, Dunderberg, Stevens, Mendota, Pay Rock.
"	Granitoid gneiss	79	Georgetown	Terrible, Brown, Griffith, Centennial, Lamartine, Freeland, Senator.
"	Granitoid gneiss	80	Idaho Springs	Stanley, Mayflower, Mattie, Edgar, Crown Point & Virginia, Champion, Seaton.
"	Granitoid gneiss	81	Gilson Gulch	Franklin, Gem, Silver Age, Sun and Moon, Casino, Freighter's Friend.
"	Granitoid gneiss	82	Nevadaville	California, Flack, Prize, Gunnell, Kansas-Boroughs, Hubert, Kent County.
"	Granitoid gneiss	83	Russell Gulch	Saratoga, Topeka, Frontenac, Lotos, Pyrenees, Pewabic, Wautaga.
"	Granitoid gneiss	84	Central City	Running Lode, Mammoth, East Notaway, Carr, Perigo, Bertha.
"	Granitoid gneiss	85	Blackhawk	Gregory, Bobtail, Bates-Hunter, Buell, Fisk, Briggs, Cook, Americus.

counties of Conejos, Hinsdale, Gunnison, Ouray, San Juan, San Miguel, and part of Rio Grande.[5] This was in the early Eocene. In late Eocene time, and in the Miocene also, at intervals, there were many big volcanic eruptions, following earth-movements throughout this region. Enormous quantities of lava, tuff, and breccia were emitted, and still later these layers were traversed by dikes.

Near the headwaters of the Rio Grande is Creede (5), the silver district that caused such excitement in 1892. The lodes are in a sheeted rhyolite and the ore is beautifully ribboned by amethystine quartz, reproducing the structural lines of the country. Jasperoid and agatized quartz characterize the veins, which are much wider than the pay-streaks themselves. Crustification is evident everywhere. While silver is the chief valuable metal, much of the ore was rich in lead also. The Amethyst and Last Chance were famous twelve years ago.

Another mining camp with a brilliant past is Red Mountain (6), half-way between Ouray and Silverton, and in the very heart of the San Juan mountains. The Yankee Girl and Guston made the fortunes of many. With silver-lead outcrops, in depth these veins became rich in copper ores carrying gold and silver. The bonanza ore exhibited stromeyerite, a sulphide of silver and copper. Native gold occurred with barite. In the Yankee Girl a wonderful chimney of ore went down to 500 ft. and was then cut off by a flat fault-plane. Ten-ton lots of the bonanza ore carried 7 to 8 oz. gold and 3000 to 4000 oz. silver per ton. In the deeper workings—600 to 1000 ft.—the average pyritic ore contained 20 to 60 oz. silver, 1 to 4 dwt. gold, 5 to 12% copper.[6] The mine-waters near the surface were very acid. Solfataric action is evident in the removal of the basic constituents of the andesite, leaving a granular silicious mass, which, in places, has resisted erosion so as to form ridges, which may be truly termed 'reefs.'

Engineer Mountain (7) is on the divide separating the watershed of the Uncompaghre from the Animas river, and it is also at the meeting point of the boundaries of Ouray, San Juan, and Hinsdale counties. The prevailing country is a dark-gray andesitic rock, containing labradorite, with augite altered to calcite and chlorite. Ransome classes this rock as latite.[7] The Polar Star lode is typical of the locality; the ore occurs in this porphyritic latite, which is bleached to light gray, with kaolinization of the feldspar. Small crystals of pyrite are disseminated, with quartz, kaolin, and diaspore. Metamorphism of the country is restricted to the immediate vicinity of the veins; here, as at Red Mountain, the mineralizing solutions were probably acid.

The mines of Mineral Point are credited to Engineer Mountain, although they are situated on an outlying ridge. At Mineral Point the rock is a typical andesite of the Silverton series; the country is penetrated by dikes of rhyolite and also by the latite. Many prominent outcrops rib the mountain slopes, and the white lines of quartz can be seen at a distance extending across the uneven surface. The San Juan Chief is in a big mass of quartz. The Old Lout, at the head of Poughkeepsie gulch, was in bonanza in 1884 and produced rich silver-bismuth ore. The Frang Hough was productive at about the same time, yielding an ore carrying chalcocite, with silver and gold. The country is a soft tuff impregnated with pyrite.

The Ophir district (8) is in San Miguel county and due south of Telluride. The mines are in various geological formations, the youngest being the andesite breccia of the San Juan series. The occurrence of ore is associated with rock decomposition, even in the deepest workings.[8] In this soft ground it is hard to distinguish between ore and rock. The latter is impregnated with iron pyrite and traversed by stringers of quartz. The Gold King and Suffolk mines are on Silver Mtn., which contains a network of veins yielding free-milling gold-quartz. The Alta, on the slope to Telluride, is a small silver-lead vein carrying tetrahedrite, well defined and unlike the impregnations that characterize Silver Mtn., for there the precious metals occur outside the limits of the vein-walls.

Within the Mt. Sneffels district (9) is Imogene basin and Canyon creek, at the head of which are some of the best mines in Colorado, notably the Camp Bird and Virginius. In the Camp Bird the main ore-shoot is 1200 to 1500 ft. long and from 5 to 20 ft. wide. It occurs in a sheeted zone of the San Juan andesite breccia, the lode being ribboned by crystallization of quartz along open spaces. Threads of free gold, galena, sphalerite, and a dark telluride mark the bonanza ore. In 1878 the mining claims at the head of Imogene basin were the basis of a fiasco called the Allied Mines Company, yet it was out of this same ground that in 1896 the Camp Bird enterprise was built, developing into one of the great gold mines of the world. The Virginius is notable for being the deepest mine in Colorado, as measured from the surface to the deepest workings, reached by the Revenue adit. The vein has been worked through a vertical extent of 3300 ft., although it is usually only a few inches wide, but rich in silver-bearing gray copper (tetrahedrite). This ore lies in a fault-fissure alongside an andesite dike that cuts across the San Juan breccia. When it reaches the overlying rhyolite the vein is difficult to follow.

The principal mines of Telluride (10) are separated from those of the Mt. Sneffels district by a high ridge into which the veins penetrate. By crossing the divide behind the Virginius mine one reaches the head of Marshall basin, in which are the Smuggler-Union and Cimarron mines. Similarly, by ascending to 14,000 ft. and climbing over the ridge overlooking the Camp Bird mine, one reaches the upper workings of the Tomboy, Argentine, Japan, and other mines of Savage basin. It is a great mining district, one of the most picturesque in the world, and richly productive ever since John Fallon located the Sheridan claim in 1875. The vein that runs

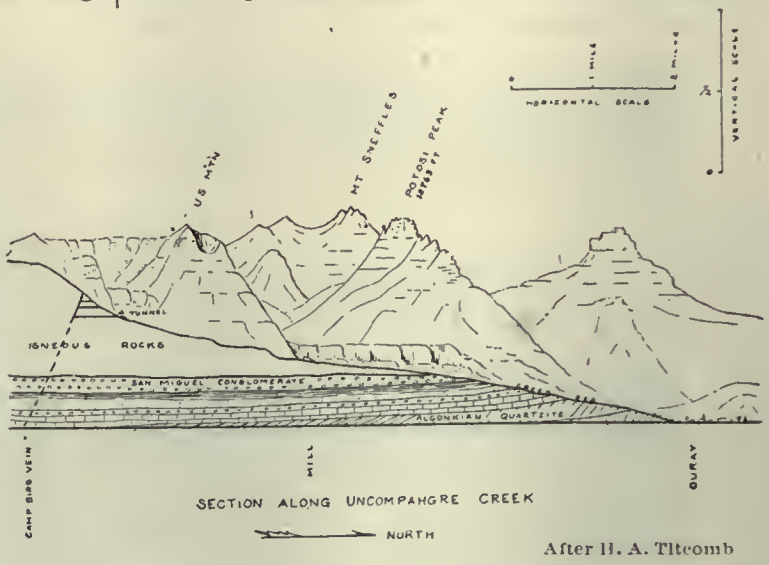
Silver Cliff, Colorado.

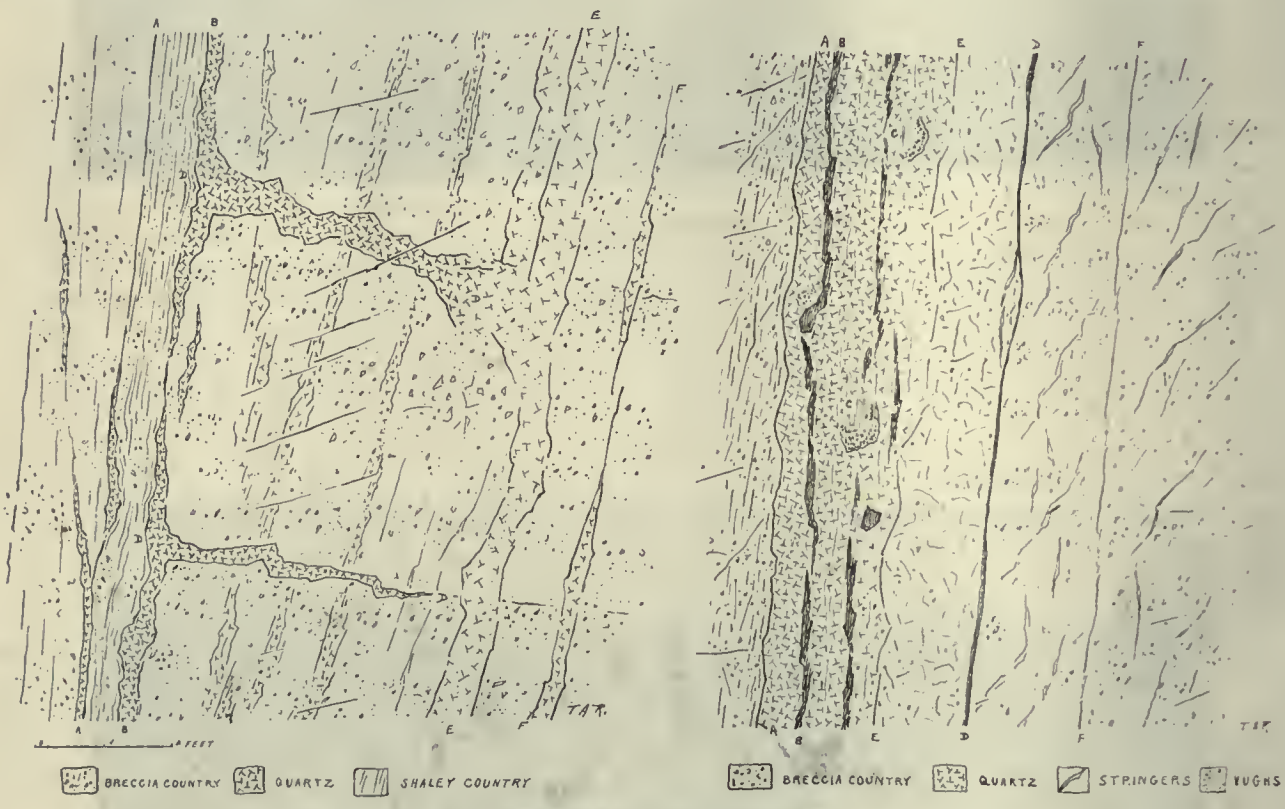
Sangre de Cristo Range and Wet Mountain Valley.

through the Smuggler, Union, Sheridan, Mendota, and Humboldt claims has been stoped continuously for a length of 5000 ft., and it has been traced for fully four miles on its strike. On the crest of the range the vein cuts through rhyolite; 750 ft. lower it traverses a sheet of augite-andesite, which is 550 ft. thick; still deeper the mine workings are within the andesite breccia of the San Juan formation. The best orebodies were found in the augite-andesite; good ore makes in zones, but oxidation reaches downward irregularly and does not coincide with enrichment. The gold and silver are associated with quartz, siderite, calcite, and rhodonite. Most of the lodes in this locality follow sheeted bands of country rather than large fault-fissures, but many of the poorer veins coincide with faults of large throw.[9]

Telluride is on the watershed of the San Miguel, while the Silverton district (11) is drained by the Animas river; the two districts are separated by one of the high ranges of the San Juan. The prevailing ore-bearing formation is a series of andesite breccias and tuff, varied by flows of rhyolite. Many large lodes rib the mountain sides and exhibit bold outcrops of the fissure-vein type, and characterized by a nearly vertical dip. They extend from the volcanic series into the underlying Algonkian schist. Some of the most important lodes are in Silver Lake basin; they are large and well mineralized, the gold and silver being associated with galena and blende, in quartz. In the Sunnyside lode and others in that vicinity, rhodonite is abundant, and rich pockets of gold ore are found within a large width of low-grade quartz. In several instances blende predominates over galena as depth is gained in the course of mining, and veins first worked for silver have become important producers of gold, mainly because, with added depth, the silver contents have diminished more rapidly than the gold. Gray copper, tetrahedrite and freibergite, characterize the rich ore throughout the district, especially as regards silver. Many of the veins are remarkably persistent and extend for the length of several claims (of 1500 ft. each). Faulting occurs and is often contributory to local enrichment.



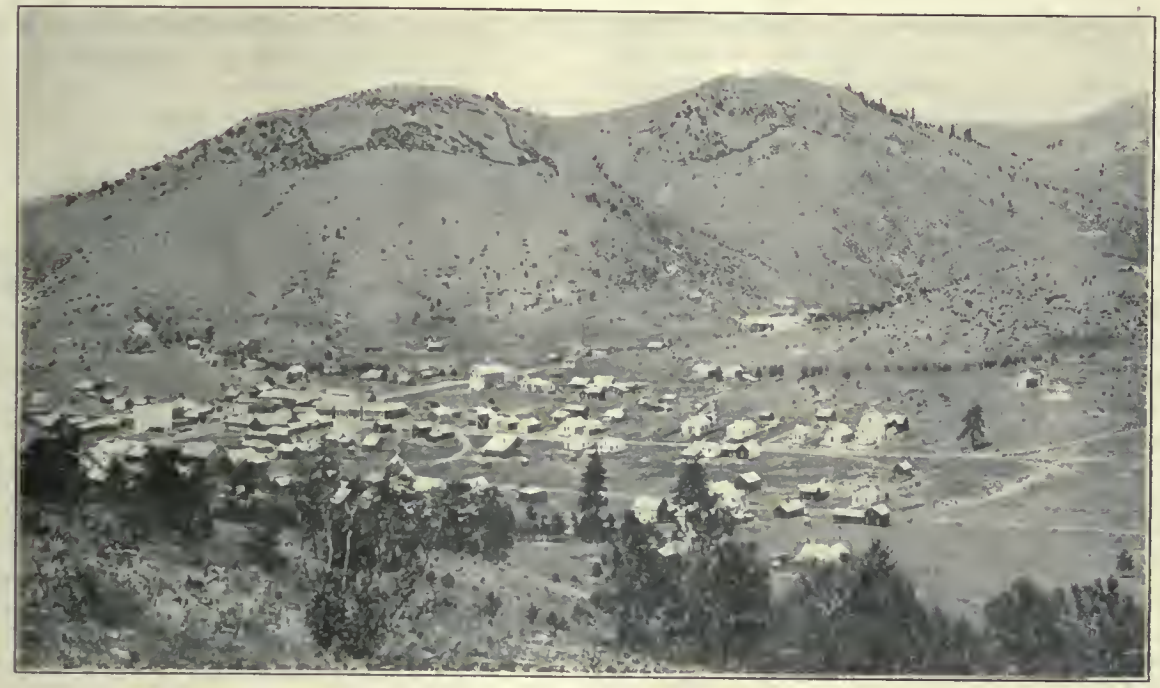
After H. A. Titcomb



Two Sections of the Smuggler-Union Vein.

The mines of Cement creek (12) are in andesite breccia also. Hübnerite, the tungstate of manganese, occurs in this locality on the west slope of Bonita peak. The most important mine is the Gold King; the workings follow two typical stringer lodes free from gouge. Apparently they have suffered no post-mineral dislocation, and this fact makes them singularly dry. Walls are lacking, the ore being a network of stringers around which the andesitic country

[9] T. A. Rickard. 'Journeys of Observation,' page 50.



Rosita, Colorado.

Quarry in Rhyolite of the Geyser Mine, at Silver Cliff, Colorado.

is much mineralized.[10] The lode often splits, and it is faulted by the Red vein (characterized by rhodonite). These irregularities led to litigation, until adjoining mines were consolidated under one ownership. The ore is mainly white quartz with plenty of pyrite, often banded. Galena occurs in bunches. In Ross basin, at the head of Cement creek, there are many prospects, exposing large croppings of white quartz, slightly mineralized.

The Lake City district (13) has been made famous by the bonanza of the Golden Fleece mine, although the Ute & Ulay property has been an important producer of lead, accompanied by both of the precious metals. The Golden Fleece appears as a comb of hard sintery quartz, rising as much as 50 ft. above the steep hillside on the edge of lake San Cristobal. The orebody was found in a block of ground bounded on one side by a contact between fine grained breccia and an overlying much coarser breccia of the San Juan formation, and on the other by a cross-vein named the Ilma.[11] At about 400 ft. below the highest outcrop the ore became poor, and in the lower workings only patches of rich stuff were found. The gold and silver occurred mainly in the form of two tellurides, petzite and hessite. The Ute & Ulay mines contain two large lodes, which have been the mainstay of Lake City for over twenty years. They are simple quartz veins of argentiferous galena, from four to six feet wide. Iron pyrite and zinc-blende are present. Geologically, the lodes are essentially lines of impregnation following a sheeted band in the andesite breccia of the San Juan formation, as seen in the Camp Bird and Smuggler-Union mines.[12]

Hahn's Peak (19) is a comparatively isolated district in the northwestern part of the State, and is named from a mountain that is a conspicuous landmark of Routt county. A core of rhyolite, locally named 'white porphyry,' breaks through the Dakota sandstone and conglomerate of the Cretaceous formation, the members of which are arched by the upthrust. It looks like a laccolith. Dikes of rhyolite radiate into the surrounding sedimentary rock.[13] The earliest mining was in the placer deposits due to the débris washed from the mountain slopes. The Tom Thumb and Southern Cross veins occur in zones of brecciation traversing the porphyry; solfataric action is evident. The Minnie D. mine yielded ore along the bedding plane of the shale near the rhyolite. This district is likely to be revived by the completion of the Denver, Northwestern & Pacific railroad.

QUICKSILVER IN MEXICO.

The latest Mexican Government reports on the status of the quicksilver mining industry in Mexico include the following mines paying taxes on May 31, 1909.

States.	Number of mines.	Hectares.*
Chihuahua	13	252.99
Durango	9	143.00
Guanajuato	7	262.00
Guerrero	24	801.98
Jalisco	14	154.78
Mexico	2	14.00
Michoacán	2	81.00
Morelos	1	10.00
Puebla	1	2.00
Queretaro	2	286.00
San Luis Potosí	44	1240.62
Sonora	2	84.00
Vera Cruz	1	10.00
Zacatecas	8	156.00
Totals	130	3498.37

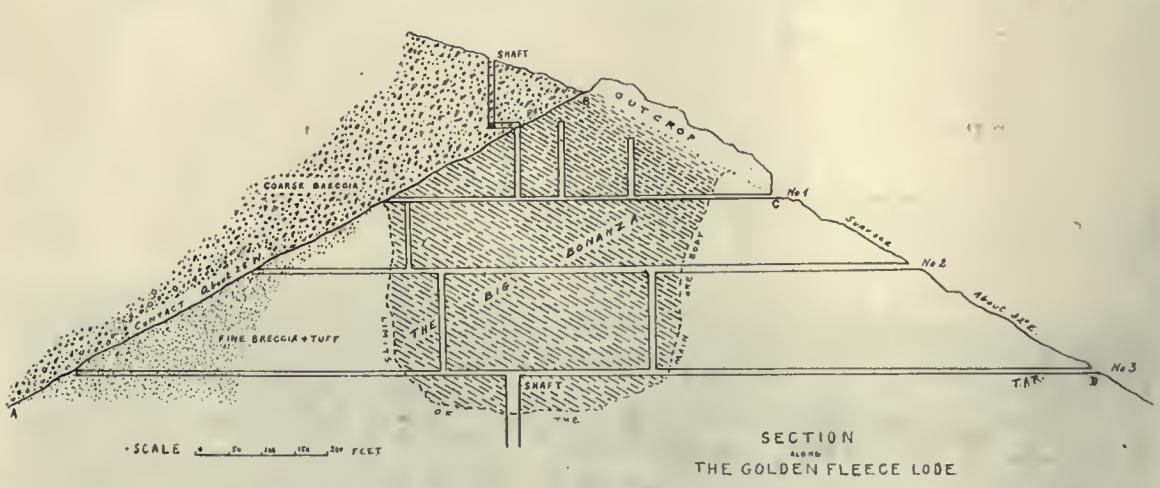
*One hectare equals 2.47 acres.

There are no statistics on the number of mines actually in operation nor on the home production. The only exportation recorded by the customs during the year past was one lot of 363 kg. sent to the United States and valued at ₱100. The importation for the fiscal year 1907-08 was as follows:

Countries.	Kilograms.	Value.
Germany	89.230	₱210
Spain	12,000.000	21,425
United States	154,488.730	170,278
France	318.750	836
Great Britain	12,281.000	24,386
Italy	10,125.000	16,410
	189,302.710	₱233.572

The number of new quicksilver mines to which title has been issued in Mexico from July 1, 1908, to May 31, 1909, are as follows: Guanajuato, 2; Mexico, 2; San Luis Potosí, 1; Zacatecas, 1; total, 6.

The industry of quicksilver mining has no immediate importance in the Republic and the metal is admitted free of duty.



OIL INDUSTRY IN CALIFORNIA IN 1909.

Written for the MINING AND SCIENTIFIC PRESS
By Our Special Correspondent.

Development in the oil industry in California for 1909 disclosed no new fields, but successful drilling was carried on either inside previously proved territory or else followed extensions of the proved fields.

Coalinga District.—Development in the Coalinga district in 1909 has, among other things, proved that the productive territory is probably limited on the north by the north line of T. 19 S., R. 15 E. The northernmost productive well is the Graham in Sec. 2 of this township. The wells of the Imperial Oil Co., only a short distance north of the Graham well, have proved unproductive and have thus shown the limits of the available territory in this direction. The Mohawk well in Sec. 12, T. 19 S., R. 15 E., has extended the proved territory at least half a mile southeast down the Coalinga anticline. The results obtained in Sec. 6, T. 21 S., R. 15 E. and in Sec. 12 immediately southwest of this, have extended the south end of the field a few hundred yards beyond its known limits in 1908. One of the most phenomenal producers of the Coalinga field and of the State was brought in during the latter part of the summer on the Silver Tip property in Sec. 6. This well produced oil for several hours at the rate of 20,000 bbl. per day. It has since been a consistent producer and is now yielding upward of 1500 bbl. per day of about 20° Baumé gravity oil. The work of the American Petroleum and Nevada Petroleum companies has extended the proved ground on the 'West Side' at least half a mile east of the eastern limit of 1908. The wells of these companies have also shown that the productive sands in 'Zone B' of the West Side field become unproductive toward the east, while 'Zone D', the productive zone in the East Side field, comes in under 'Zone B' in the eastern part of the West Side field and will have to be depended on for the production in the territory east of a practically north-south line through the middle of Sec. 30, T. 20 S., R. 15 E. The consistent performance of the American Petroleum wells, which so far have fallen off relatively little, has been one of the marked features of the development of the year. These wells produce all the way from 400 to over 1000 bbl. per day and cause but little trouble in the way of sanding or water production. Development south of Waltham creek as far as the El Cerito well has not been attended with success. The El Cerito and Peoples Associated wells have been practically abandoned, while two or three others which are drilling in similar territory are not obtaining encouraging results. This work has demonstrated that the region mapped as non-mineral by the Geological Survey is either underlaid by dry sands only or by oil sands too deep to be reached by modern methods of drilling. The wells drilling within the line of probably productive territory, as mapped by the Survey, have not attained a depth where it is believed the productive sands lie, so that no conclusions regarding this territory can as yet be definitely announced. Development in the proved Coalinga field, both on the East Side and the West Side, has been carried forward vigorously during the past year, and the effect is seen in a marked average increase in production from month to month.

Devil's Den District.—Considerable development has taken place in the Devil's Den district, owing to the discovery of light gravity oil in the well of the Devil's Den Consolidated Oil Co. during the middle of the summer. Some of the work done, however, has been anything but along the lines of legitimate development, the operators being content to drill shallow 'post holes', in which they make a so-called 'discovery' of tar sands, hoping thereby to obtain a patent to the land. With the exception of the discovery mentioned at the beginning of this paragraph, and one or two others of minor importance, no positive results have been obtained.

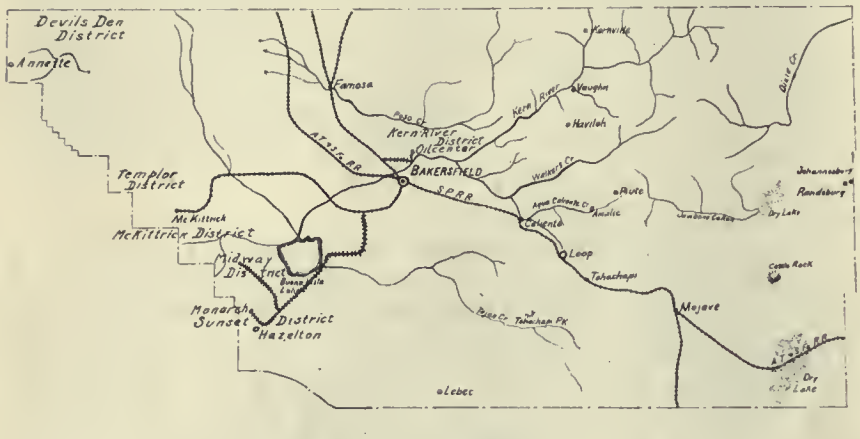
McKittrick District.—Several wells have been sunk during the past year in the McKittrick district, but all, with the exception of one or two, have been within proved territory. One or two wells have been sunk in the region north of the Temblor valley, but so far without success. The only prospect that has yielded quantities of oil that appear to be of commercial importance is the O'Donnell well, situated in Sec. 6 in the low hills north of McKittrick. This well shows indications of becoming a moderate producer of heavy oil. Water still continues to encroach on the productive territory and is more than ever a menace to the life of this field. Strenuous efforts have been made to discover a remedy for the evil, but so far without result.

Midway District.—This district has attracted more attention possibly than any other in the State. At the close of 1908 development had extended as far as the south line of Sec. 31, T. 31 S., R. 23 E., but with the drilling of the Hawaiian, Bear Creek, Majestic, and other wells in the region three or four miles northwest of this section, the extension of the field was assured. As a result of the discoveries made by these wells, the whole Midway flat has been dotted with derricks as far northeast as the Buena Vista hills. In these hills two important gas wells, the Honolulu and Standard, have been brought in, the gas being in such large quantities and under such great pressure as alone seem to assure commercial success. One of the most important discoveries in this field from a commercial standpoint is that of a deep productive sand found underlying the upper oil formation throughout a considerable territory north of the Santa Fe camp. Several wells have been drilled at the south end of the Midway field, and enough evidence has been disclosed by these to warrant the belief that the Midway and Sunset fields are practically continuous.

Sunset District.—Development in the Sunset district has extended the proved territory northward until it practically connects with the Midway district. Development has also proved a part of the flats east of the former field, nearly to the Lady Washington property. One of the sensations of the year in this district was the bringing in of a big water well on the property of the Northern Oil Co. This well started with a flow of about 50,000 bbl. per day and is at the present time yielding large

quantities of warm slightly saline water. The water question is, therefore, one of paramount importance in this field, and operators are looking forward to a solution of the problem with a good deal of anxiety. In this field, the biggest producer of the year brought in was Wellman No. 5, which yielded 3000 bbl. per day for a short time. Within a week, however, the production dropped to 500 or 600 bbl., and at the present time is considerably less. This well simply repeated the history of several at the northern end, which started with large productions but soon dropped to 150 to 300 bbl. No positive results have been obtained by any of the wells being sunk along the hills east of Sunset, although a number of strings of tools are at present operating as far east as three or four miles from Hazelton.

Santa Maria District.—The principal development in the old part of the Santa Maria district, known as the Graciosa or Orcutt field, has been along the lines of drilling within proved territory. Water has become troublesome on the south side of the Graciosa Ridge, and although many efforts have been made to discover the source of the water and remedy the evil, few results have been obtained up to date. Quite a number of new wells have been put down in what is known as the Cat Canyon field, adjacent to the Palmer, the wonderful gusher which has been flowing at the rate of from 10,000 bbl. per day down to 1500, its present output. Although several of these wells have been sunk into the sands which supply the Palmer well, none has so far proved successful. Such a condition is hard to understand, although in the case of the Palmer well the drillers worked with it for several months before being able to bring it in. The prospect wells sunk east and northeast of the Cat Canyon field have so far been unsuccessful, though pioneer work is still going on in the region. The Purisima Hills field has been extended both east and west from previously proved ground, and prospect wells are now being sunk at several points along the axis of the Purisima Hills anticline. Wells in the region of Santa Ynez have so far not proved productive, but exploratory work is still going on.



Kern River Oilfield.

Summerland Field.—No new developments have taken place in the Summerland field. The refinery which was formerly situated at Summerland has been moved to near Arroyo Grande, so that the market facilities have become poor. The production is gradually falling off and the water is becoming noticeably troublesome in wells that previously yielded a large percentage of oil. Some prospect wells have been started in the region east of Summerland, but so far without positive results.

Santa Clara Valley District.—A good deal of activity has been shown in the various fields in the Santa Clara Valley district in southern Ventura county and western Los Angeles county. Several prospect wells put down in the Ojai Valley, Sespe, Piru, and Pico fields have been successful in extending the known productive territory. The oil in this district is as a rule light, and finds a ready market for refining purposes. Owing to the complex geological conditions the developed areas are small and widely separated, and prospecting is, therefore, more hazardous than in some of the districts where the geological conditions are more uniform.

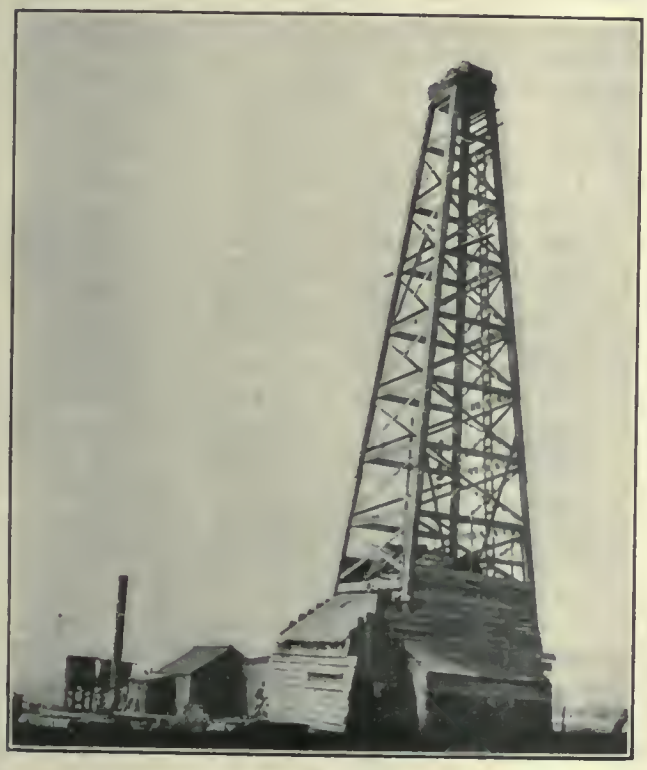
Los Angeles District. — Prospecting carried on in the Los Angeles district has resulted in extending the proved territory southwestward from Sherman as far as the Wolfskill ranch. Here a 400-bbl. well was brought in during the summer, and, in addition, several gas and two or three productive oil wells have been drilled in the same vicinity. Prospecting in the Raphetto hills, between the Los Angeles and Whitties fields has so far resulted negatively, although drilling is still being continued. In the Los Angeles field proper the wells are gradually being abandoned as the production falls off. The Salt Lake field, west of the city, has been pretty well outlined by drilling, and its production has been kept fairly uniform by the bringing in of new wells at quite regular intervals. Within the year the deepest well in the State, the Brashear, was completed in this field. It reached a depth of 5323 ft. and cost, roughly, $40,000.

Kern River District.—Although no longer California's banner oil district, the Kern River field produced more oil than in any previous year. The production of 1909 was a few thousand barrels over 15,000,000. The demonstrated territory has been extended about one-quarter mile to the southwest by wells drilled during the year, and the higher value of oil has made it profitable to open up some of the old wells in the northeastern part of the field which have been idle for several years. The flooding water which has been threatening certain portions of the field seems to be yielding to the use of the air-lift, and several wells have been replaced on the producing list after having been idle for some time on account of water. On December 1 there were 1628 completed wells in the district, of which 1339 were pumping, 17 idle, and 272 abandoned. Thirty-four strings of tools were running on new wells.

Puente Hills District. — An extension of the territory previously proved has taken place in several of the fields of the Puente hills. In addition to this,

the new field in the Coyote hills, hitherto an unknown quantity, and still more or less of an enigma, has developed two or three wells, showing signs of eventually becoming good producers. One of the most important discoveries has been that of the Central Oil Co., which brought in a well producing light oil, north of the main part of the Whittier field. This well has stimulated prospecting in the older formations toward the centre of the Puente hills.

Minor Fields About the State. — Prospecting has been going on at several localities throughout the State in the hope of discovering new fields. Among those in which the results have been more or less encouraging are the Newport Bay field in the southern part of Orange county, the Sargents field in Santa Clara county, and in the Lonoak district in eastern Monterey county. As yet no definite results have been obtained in these new fields, but prospecting



Brashear Well, a Mile Deep in Salt Lake Field.

is still going on, with some chance of discovering commercial quantities of oil.

Prices. — The price of petroleum has remained practically the same as at the beginning of the year, namely about 63c., although many contracts have been signed at the rate of 50c. at the well. The Standard and K. T. & O. companies made an effort to cut the price to 40c., which resulted in a dismal failure owing to the strength of the Independent Producers' organization. The most important combination that took place during the year was the contract entered into between the Independent Producers and the Union Oil Co., whereby the latter agrees to market all of the product of the Independents for ten years. This gives the Union control of a big percentage of the output of the State, and put the Independent Producers on a firm foundation. The contract between the Independents and the Union guarantees stability of the oil market for some time to come.

INDIANA OIL FIELDS IN 1909.

Written for the MINING AND SCIENTIFIC PRESS
By RAYMOND S. BLATCHLEY.

The Indiana fields are rapidly declining. In the Trenton Rock district a majority of the old wells are being abandoned. About 2400 wells were plugged in 1909, and about 4400 in the last two years. In the last five years 7500 wells have been abandoned. In all about 25,000 wells have been drilled in this field. Of these 7000 were dry and 7500 have been abandoned, leaving 10,500 now producing. Of the wells drilled in 1909, 35% were dry. The Lima-Indiana field reached its maximum in 1904.

In 1909 considerable 'wild catting' was done in the southern counties of the State, along the edge of the coal measure basin. But few wells gave indications of oil except in the new field opened at Oakland City, in Pike county. The oil and gas were found here at a depth of about 1100 ft. and are in the so-styled Corniferous limestone of the Devonian. About 25 wells have been put down, bringing in a new production of over 1500 bbl. The following table gives the new development by months in the Indiana fields, according to the *Oil City Derrick*:

	Wells completed.	New production.	Dry holes.	Wells abandoned. 1908.	Wells abandoned. 1909.
January	30	308	9	75	149
February	16	59	7	59	108
March	18	200	2	129	237
April	24	241	4	198	98
May	26	281	7	358	204
June	36	298	9	207	347
July	27	467	8	191	157
August	27	287	6	228	322
September	19	381	6	195	267
October	29	445	13	144	201
November	16	114	5	155	172
December	..	....	..	220	....
Total	268	3,091	76	2,159	2,268

The Appalachian fields cover the States of New York, Pennsylvania, southeastern Ohio, and West Virginia. A great amount of drilling was done during 1909 with the result that 35% of the bores were dry. The main development took place in the high-grade oil territory of West Virginia and southeastern Ohio. The production of the eastern fields will be proportionately higher than the western fields for the year. The following table, compiled from the *Oil City Derrick*, gives the development by months of the Appalachian fields:

	Wells completed.	New production.	Dry holes.
January	600	4,605	158
February	579	4,881	155
March	554	3,976	173

MID-CONTINENT OIL AND GAS FIELDS.

Written for the MINING AND SCIENTIFIC PRESS
By L. L. HUTCHISON.

The term 'Mid-Continent Oil Field' seems to have come into official use with the issue of 'Mineral Resources of the United States' for 1905. As there defined, it included the petroleum and gas-producing region of Missouri, Kansas, Oklahoma, and Indian Territory. Indian Territory is now a part of Oklahoma, and the same publication for 1907 defined the Mid-Continent field as southeast Kansas, Oklahoma, and north Texas. It is in this latter sense that the term is here used. The oil fields of the region are divided for convenience into the main field, the Arbuckle-Wichita, and the northern Texas. By the main field is meant that portion of the region which lies in southeastern Kansas and north of the Arbuckle mountains in Oklahoma; that in the vicinity of the Arbuckle and Wichita mountains is designated as the Arbuckle-Wichita district, and the occurrences at Corsicana, Powell, and Petrolia (Henrietta), Texas, belong to the northern Texas region.

The geology of the main field is comparatively simple. The rocks consist of alternating strata of limestone, shale, sandstone, and occasional beds of workable coal of Pennsylvanian or Coal Measures age. So far no paying wells of either oil or gas have been authentically reported from rocks older than Pennsylvanian, thought there are some unproved rumors to the effect that gas has been found in the 'Mississippi lime' which is the Boone formation of Lower Carboniferous age. The normal dip is approximately N. 85° W. in the vicinity of Glenn pool. In the northern part of Oklahoma the dip is more to the north, while farther up in Kansas the dip is nearly northwest. Locally the dip is reversed, thus forming anticlinal and synclinal folds. The anticlinal folds often appear to act as catchment basins for the petroleum and gas, so that some of our best pools are situated along well defined folds. The accumulation, however, in some restricted regions seems to be controlled by folding and irregular deposition of the containing sandstone.

The oil and gas of the Arbuckle-Wichita region is relatively unimportant. Occurrences are known at Granite, Gotebo, Lawton, Wheeler, and Madill. The Gotebo and Lawton fields supply gas for local use, and the Wheeler furnishes the supply for Ardmore. A little oil is also found at Gotebo and Lawton, while Wheeler has an estimated capacity of 600 bbl. per day. The Madill pool is the only one from which oil is being marketed. The petroleum at Granite, Gotebo, Lawton, and Wheeler seems to be found near the base of the Permian Redbeds, which lie unconformably upon older rocks. Oil is found in five different sands at Petrolia, Clay county, Texas, above a depth of 750 ft. It is believed that these sands are above or near the base of the Permian. The 'deep gas,' 1200 ft. and below, is doubtless in the older formations, probably Pennsylvanian in age. The Powell-Corsicana production is from Cretaceous formations. That at Madill is from the base of the Comanche Cretaceous, which is unconformable upon older rocks. The present opinion is that neither the Permian nor Cretaceous of these localities, except in the Powell-Corsicana field, have given rise to oil and gas but that the accumulations are from the older rocks below.

The Mid-Continent field first became a noticeable factor in the production of petroleum in 1906, when it produced 18.05% of the yield of the United States, and ranked third among the great fields. In 1907 and 1908 it held first place by yielding 28.20% and 26.91%, respectively, of the production. Just what the final statistics for the year 1909 will show is hard to predict, but it is believed that the field has not lost rank, though activity has been below normal for the past year. This lessening of action was due, in the main, to three causes: (1) decrease in prices; (2) friction between the State and the pipe-line interests; and (3) arbitrary rulings and demands of the Department of the Interior relative to Indian lands in Oklahoma. The trouble with the State arose out of the attempt of the pipe-line companies to avoid domestication and disposal of production owned by them as provided by law. The three interstate lines, Texas, Gulf, and Prairie Oil & Gas Co., have now accepted the State laws. The Oklahoma Pipe Line Co., the domestic branch of the Prairie Oil & Gas Co., is now building a 12-in. line from Oklahoma to New Orleans. It is hoped that the completion of this line will greatly relieve the market conditions. The Department of

*Data for north Texas and Kansas incomplete.

the Interior from time to time changed regulations and made what appeared to be hard and arbitrary rules concerning the leasing of Indian lands. These often rendered operation almost burdensome. Lessees were required to drill whether there were markets or not, and then forced to pay royalties at the rate of 41c. per bbl. while receiving only 28 to 35c. for the oil marketed. Certain restrictions relative to pipe-line rights-of-way across Indian lands were also a great handicap. The lessees and pipe-line companies have gained some Departmental concessions which promise considerable relief.

The average price for north Texas oil in 1908 was 70c. per bbl., but it was nearly 10c. less for November 1909. The average price during 1908 for Kansas oil was 41c. for light oil, and 30.4c. for heavy grades. Oklahoma light oils were the same price, but heavy oils were 2.2c. higher. These are the prices that prevailed the first of 1909, but they have steadily fallen until the prices posted for November, 1909, were 28 to 35c. per barrel. Statistics for December 1909, are not yet available, but such data as can be had show the Mid-Continet pipe-line runs to have aggregated 42,985,613 bbl. for the twelve months preceding December 1, 1909. Data for Kansas and northern Texas production are incomplete. Statistics of rail shipments and crude used by local refineries and for fuel are not obtainable, but car shipments from the Glenn pool alone averaged 7945 bbl. per day through March and April. Rail shipments fluctuated, to be sure, but it seems that 10,000 bbl. daily would be a conservative estimate for the car shipments and local demands of the entire field for the year. This would give 3,650,000 bbl. in addition to the 42,985,613 run by the pipe-lines, making an aggregate yield of 46,535,613 bbl. for the twelve months preceding December 1, 1909. If these estimates and data are correct the Mid-Continent field will fall but 1,788,197 short of the 1908 production.

Oklahoma holds first in the number of new wells. In spite of the organized effort of the Oklahoma producers to curtail development, there were 3337 wells completed as against 2844 last year. Of the Oklahoma completions 394, or 11.80% were either dry or produced gas only, as against 386, or 13.57%, in 1908.

MID-CONTINENT WELL RECORD AND NEW PRODUCTION,* DECEMBER 1, 1908, TO DECEMBER 1, 1909, BY STATES.

State.	Completed.	Producing.	Dry.	New production.	Average.	Per cent dry.
Kansas	512	287	225	124	4.40	43.94
Oklahoma	3,337	2,943	394	223,650	75.99	11.80
†N. Texas	154	118	36	1,008	8.54	23.37
Totals	4,003	3,348	655	225,922	67.47	16.36*

*Gas wells rated as dry.
†Data April to November only.

Several disturbing elements which caused unrest among operators and purchasing companies have, to a great extent, been removed, and time has proved that both can profitably operate under the new State laws. The factor which causes evil forebodings for the next year is the matter of price. If prices remain as at present the whole field will be under the greatest handicap of its history, but if the completion of the Standard's line, which is now building to the Gulf Coast, causes the advance that is predicted by many, the year of 1910 will be a record-breaker for the Mid-Continent oil and gas region.

The number of wells completed in the twelve months under consideration aggregate 4003, or 390 less than for the year 1908. Of these 655 or 16.36% were dry, as against 903 or 20.57% in 1908. It must be borne in mind, however, that gas wells are classed as dry holes. The number of holes actually lost in 1908 was only 432, or 9.83% of the number drilled. The 1909 gas-well report is not at hand.

PETROLEUM IN ILLINOIS IN 1909.

Written for the MINING AND SCIENTIFIC PRESS
By RAYMOND S. BLATCHLEY.

Approximately 29,700,000 bbl. of petroleum is the recorded production of Illinois in 1909, as against 33,685,106 in 1908. The decline was due to overstocking the market and inability of pipe lines to handle the product. The returns for the first eleven months only are available at this time, but if it be estimated that the December output was equal to that of November and the tank-car shipments were 1,500,000 bbl., the same as 1908 only, the total is over 29,700,000 bbl. The following table gives the pipe-line runs of the Ohio Oil Co. by months:

	Barrels.
January	2,494,492
February	2,358,198
March	2,568,393
April	2,388,309
May	2,536,413
June	2,365,956
July	2,413,218
August	2,411,483
September	2,203,706
October	2,228,269
November	2,149,372

The tank-car shipments are those of the Sun Oil Co., Cornplanter Oil Co., and the pipe-line runs of the Indian Refining Co., and the Tidewater company. The latter company opened its line to the field in the spring. The runs of the first half of the year kept pace with those of the previous six months, but with the coming of summer activity was checked and drilling was discouraged. Production was further restricted by a drop in the price of oil. In the late spring the price declined from 68c. per bbl. for oil

above 30° B. and 60c. per bbl. below 30°, to 65 and 57c. Later it took another drop to 62 and 54c., and finally in October it fell to 60 and 52c. for the two grades. These prices prevail at present.

A review of operations shows that the activity shifted southward from Clark and Crawford to Lawrence county, where six distinct oil sands are attracting attention. These are found at varying depths of 850 to 2000 ft., and in their order are, the Bridgeport No. 1 and No. 2, the Buchanan, the Kirkwood, the Tracy, and a deep sand recently discovered at 1975 ft. This latter sand was first found in Sec. 30 of Bridgeport township, and is especially interesting as it yielded an initial production of 50 bbl. per day and has held up to that mark for over two months. The Kirkwood and Tracy sands have developed into the richest found in the field. They are found at average depths of 1400 and 1700 ft. respectively, and have shown both remarkable initial and constant production. The deeper sands have not been tested because of an inactive market and the increased expense due to caving ground in the lower formations. Work has slackened noticeably in Clark, Coles, and Cumberland counties and a great many wells were abandoned during the year. The shallow sands of these counties have gradually lost production and there is now almost no original work in this territory. Crawford county fell but little below the previous year, as extensions of the field were found at Oblong, New Hebron, and Flat Rock.

WELLS DRILLED DURING 1909 IN ILLINOIS BY COUNTIES.

County.	Wells completed.	New production, bbl.	Dry holes.
Crawford	1,979	41,514	334
Lawrence	677	36,496	52
Clark	174	3,174	44
Coles	11	95	2
Cumberland	29	488	10
Edgar	5	10	3
Miscellaneous	100	439	81
Totals	2,975	82,216	526

On January 1, 1909, it was estimated that 13,346 wells had been drilled. Of these 1821 were dry holes. During 1908 there were 3574 wells put down, of which 561 were dry. The new production for the year was 78,960 bbl. In the first eleven months of 1909, 2975 wells were drilled, with 526 dry holes and a new production of 82,216 bbl. Up to December 1 the total estimate would reach 16,321 wells drilled, of which 2347 were dry. A record of drilling by months, from the *Oil City Derrick* is given above.

There was an increase of 'wild catting' during the year, especially along the western edge of the great structural basin of southern and central Illinois. The territory around St. Louis, in Greene, Jersey, Macoupin, Madison, and St. Clair counties has been widely drilled, however, with but meagre results. At Carlinville a fair gas pressure was tapped, and at Waverly, in Morgan county, a small showing of oil was found. Along the southwestern edge of the basin, near Du-Quoin, a well was drilled with the view to testing a dome-like structure that exists there and which has conditions favorable to the accumulation of oil. A large amount of drilling was done in Randolph county, which was occasioned by the finding of oil at Sparta in 1906. The small production that came in during 1908 has so increased that the Sparta field is all but abandoned at the present time. Further work has failed to bring results. Oil was found in small quantity at Eldorado, in Saline county, but not on a commercial scale. The sand at Eldorado and

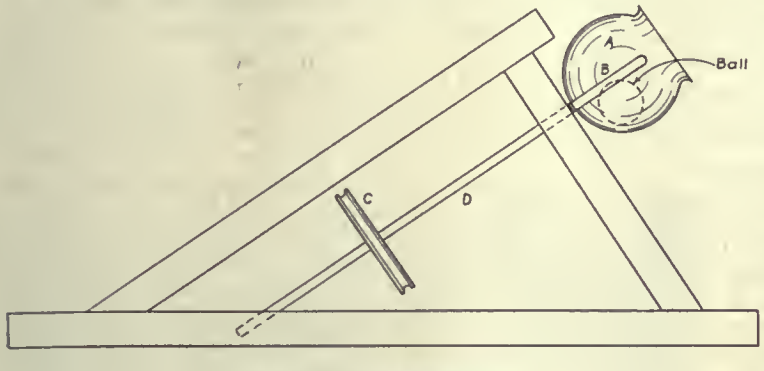
Map Showing Location of Illinois Oil Fields.

those of the deeper formations in the main fields are of the Chester group in the Mississippian rocks. These outcrop near Sparta and are the seat of oil accumulation there. During the year a new field was opened up in Marion county, near Sandoval. Four wells yield oil accompanied by an excellent pressure of gas. The field received its impetus from the finding of oil in a coal mine at Centralia during 1907. This occasioned drilling in all directions, with the result that oil was first found in the coal measures near the mine and later at Sandoval, ten miles away. At the latter place the oil horizon was in the Chester formation. There are two pay sands in the Chester, which apparently may be correlated with the Buchanan and Kirkwood sands of the Lawrence county field. Up to the present writing, the pay seems to be limited to a single area covering 300 acres or more of ground, forming an isolated pool. The wells averaged about 125 bbl. on initial output.

HOME-MADE GRINDING PAN.

Written for the MINING AND SCIENTIFIC PRESS
By WILLIAM H. WASHBURN.

During the past ten years I have used the device here described, in connection with stamp-mill work, for grinding and testing ore and tailing samples as to their amenability to amalgamation and cyanidation, and for cleaning up amalgam, and have found it satisfactory for such purposes. Referring to the sketch, *A* is a round-bottom iron or steel pot, such as may



Sketch Showing Mechanism.

be bought at any hardware store, the legs of which, if any, may be removed with a hacksaw; *B* is a four-pronged spider, made to fit the pot. They extend about 2 in. above its greatest diameter. This spider should be made of iron sufficiently thin (say ¼ by 1½ in.) to have enough elasticity to hold the pot snugly in place; *C* is a grooved pulley for driving the shaft *D*, to which the spider is attached permanently. A good way to do this is to screw it into a suitable hole in the base of the spider, flush with the inside, and rivet the end of the shaft to keep it tight.

In the pot is an iron or steel ball of 4 or 5 in. diam. for a pot 1 ft. diam. In case such a ball is not obtainable, rounded cobblestones may be used. The shaft is driven by a rope belt from some convenient shaft, at a speed of 50 or 60 rev. per min. In setting up and lining the shaft, it will be found necessary to line it at an angle with the driving shaft, the angle depending upon the distance between the two. The closer they are, the greater the angle necessary, to allow the drive rope to lead without too much side-pull. The sample should be first crushed to a size of not more than ¼ in., but ⅛ is better. The ball will then crush it to any fineness desired. If an amalgamation test is to be made, it may be well to allow the ore to be ground until nearly as fine as required before adding the mercury, but this is not absolutely necessary, as it will be found that its tendency to flour is much less with the ball than with a sliding grinding surface. When the pot is in motion, the ore sample is continually turned, both vertically and horizontally, thus preventing any dead corners. When finished the pot may be removed and the sample panned in the usual way. About 2 lb. is a convenient amount for a pot of the size here shown. Should a larger pot be needed, it may be used as large as can be obtained. I have used one 3 ft. diam., in which battery pulp could be ground, but in that case the pot was permanently fastened to the spider, and the material cleaned up with the pot in place. Of course this larger-size pot should be run correspondingly slower, perhaps 20 or 25 rev. per min., and have a proportionately larger ball, or rounded stone, as the case may be. It was bought ready-made for about $5. When making a cyanide test, after the sample is ground sufficiently fine, it may be transferred to a wooden keg, placed either in the pot or the spider, as most convenient, and the solution added, when it will be found to be a good agitator.

It will be worth many times its cost for preliminary tests as above outlined. Besides it is useful for grinding dirty amalgam, blanket-washings, and the like, including battery pulp, if the pot is large enough for this purpose, and there is no clean-up pan or barrel available.

The accompanying photograph shows a small pot which I recently used for some amalgamation and cyanide tests, where no power was available; so a small impact water-wheel was constructed, having tin buckets, and driven by water under about 15-ft. head, through a ⅜-in. nozzle. The shaft was made of a piece of ¾-in. iron, from which the power was transmitted to the inclined pot-shaft by a rope. The water-wheel is shown at the right of the picture, and it did the work well.

One of the merits of this device is that it may be

Field Mounting of Pan.

quickly and thoroughly cleaned, eliminating the danger of the results of one test overlapping another.

One of the first results of the discovery of oil in Mexico has been the diminution of coal imports. Formerly the Mexican railways consumed annually 120,000 tons of patent fuel from South Wales. In the latter half of 1908 half the locomotives were altered to burn liquid fuel, and it is now only a question of providing the necessary oil-storage tanks at suitable points for oil fuel to become universal. Other industrial power plants are being converted to oil fuel and the import of solid fuel is reduced by about one-half.

Special Correspondence.

NEW YORK.

Copper.— Cobalt Dividends and Stocks. — Yukon Gold Dividend. — Braden Copper.—'Orient' Railroad.

The copper situation continues to hold public attention. There is enough uncertainty and diplomatic moving about of the pawns in the game of the big merger to make it unusually fascinating, especially to the small stockholders in the various companies which are being talked of as component parts of the combination. While there is little doubt that the copper merger plans will be carried through eventually, at present the whole matter is outwardly at a standstill. The most important of the preliminary consolidations, that of the Guggenheim properties, by which the Utah Copper was to absorb Boston Consolidated and Nevada Consolidated, has been apparently abandoned for the time being. Nevada Consolidated is to be listed upon the New York Stock Exchange, and a semi-official announcement is made that as a mining company Nevada Consolidated will stand alone. Utah Copper interests claim that this move of the Nevada Consolidated is simply to force, if possible, better terms than the basis now proposed, of one share of Utah Copper for two and a quarter shares of Nevada Consolidated, and that in the end the plan as originally outlined will go through. This contention is strengthened somewhat by the fact that Utah Copper has issued a call for a special meeting on January 17, to increase the capital stock from 750,000 to 2,500,000 shares, which increase is sufficient to make the contemplated exchanges for both Boston Consolidated and Nevada Consolidated and to leave a reserve of something over 410,000 shares in the Utah Copper treasury. The interest of the bankers and financiers at present trying to arrange the copper combination is intensely flattering to many of the smaller shareholders in the companies mentioned as going into the deal. These shares have been mostly handled in the outside market and are largely scattered in the hands of small holders, and as the deals under way have increased the sense of importance of the little stockholder it has also held his undivided attention to the exclusion of nearly everything else in mining. So far as the Eastern market is concerned, it is nothing but copper. A striking instance is the fact that neither the anticipated cut in the La Rose dividend, from 4 to 2% quarterly, nor the declaration of the regular quarterly 7½% dividend of the Nipissing moved either issue fractionally one way or the other. A complete apathy of the public is shown toward Cobalt, notwithstanding the wonderful dividend-record of the Canadian silver camp for 1909, exceeding as it does six and a half million dollars for the twelve months. The royalties exacted by the Government of the Dominion from the Cobalt companies has with many of them been a vital point for a long time. Under strong pressure the Dominion Government has at length made some concessions. Originally all Government leases called for royalties based on the gross production. Two of the Crown grants have been amended, so that hereafter the City of Cobalt Mining Co. and the Chambers-Ferland Mining Co. will pay, as royalties, 25% of the net proceeds, instead of that proportion of the gross output. This means a considerable advantage gained for the companies named. The fight which is being made for the control of Cobalt Central is being adjourned from day to day. J. S. Bradley, who is representing the outside stockholders in the attempt to oust Thos. A. Nevins & Son from the management, states that he expects within a few days to be in a position to hold and absolutely control the adjourned meeting. Mr. Bradley also states that the records show the 238,500 shares of treasury stock have been sold in the open market without any opportunity having been given to the shareholders to subscribe for them.

A quarterly dividend of 10c. per share, which is at the rate of 8% per annum, is to be paid to Yukon Gold shareholders. In addition to taking action on the dividend, the directors accepted an offer of the Guggenheim Exploration Co. of $5 per share for 297,000 shares of the Yukon Gold stock remaining in the company's treasury. The Exploration company had previously advanced some $2,322,000 to the Yukon company in outfitting its dredges and in preliminary operating expenses, and the transfer of the shares mentioned is equivalent to a payment by the Yukon Gold Co. of $1,500,000 upon its indebtedness, while the Yukon shareholders are also to have the right to subscribe for the shares at the rate of one share for each share already held. The Braden Copper Co. of Chile is evidently to be numbered among the low-cost producers. Barton Sewall, president of the company, has issued a report in which the earnings are figured on a basis of 2000 tons per day, with a metal market ranging from 13 to 17c. Mr. Sewall figures copper costs at 7.67c. per pound and makes the statement that costs will probably be reduced to 7c. He says also that over 5,000,000 tons of ore have been developed at the property, with an average copper-content of 2.7%. Several engineers who have examined the properties are quoted as stating that still greater orebodies should be developed. The United States & Mexican Trust Co. is to remove its headquarters from Kansas City to New York. This company is A. E. Stilwell's financial institution, being wholly identified with the building of the Kansas City, Mexico & Orient railway, which has its western terminus at Topolobampo, Mexico, and is looked upon as one of the important factors in the commercial development of the next ten years in Mexico.

CHIHUAHUA, MEXICO.

Mayo River Power-Plant. — El Rayo, Parral. — Las Vegas, Conchos River.—Rio Plata, Santa Barbara.—Mexico Con., Guanecevi. — Batopilas.

A large power-plant is to be erected on the Mayo river in western Chihuahua by the Mayo River Power & Land Co. of Denver. The capitalization of the company is placed at $5,000,000. The plan is to build a series of impounding dams and to erect a hydro-electric power-plant at each site and distribute power to mining companies. The first dam-site has been situated near San Bernardo, Sonora, a station on the new Southern Pacific line. S. Pearsons & Co. have now completed the survey of the railroad that is to be built from the main lines to the site of the Conchos dam, and work will be commenced early in the year.

The El Rayo mines, near Parral, Chihuahua, owned by a New York company, are milling about 4000 tons of ore per month and netting returns of about $20,000 per month. The management claims a reserve of over 20,000 tons of ore, which at the present rate will give four years work. Including several adjacent properties recently purchased, the company now owns approximately 500 acres of claims, and the total length of the workings is nearly two miles. The report for last September shows 4080 tons crushed, averaging $14.14 per ton in value, and the net profits for the month were $18,644, as against $22,116 for July. William Adams, a well known mining engineer of northern Mexico, recently committed suicide at a hotel at Chihuahua by taking morphine. He stated in a letter that bad luck in mining deals had so disheartened him that he determined to try another world. He was a Mason and a Shriner, with no relatives in Mexico.

The adverse tariff on zinc ores going into the United States does not seem to have had more than a temporarily depressing effect on the zinc mining industry of northern Mexico. The increase in price has more than compensated for the tariff, and there is a steady shipment to both the United States and to Europe.

The Las Vegas mine near the Conchos river, close to the line of the Kansas City, Mexico & Orient railroad, has been bonded to the Phelps-Dodge interests. Before the opening of the railroad mine was badly handicapped, as during the wet season the long haul to the nearest railroad was a serious matter, requiring ten days under favorable conditions, but since the new line has been opened to traffic the mine has been making regular shipments of high-grade ore to the Chihuahua smelters.

The Rio Plata Mining Co. has issued a report for the month of October showing the result of the operations on

their mines of Santa Barbara near Guayapares in Chihuahua. The stamp-mill ran for 27 days and crushed 1687 dry tons of ore, giving a gross product of 51,147 oz. silver bullion, which was obtained from the total product of the ore shipped and milled, the latter including the product of the cyanide plant, and the concentrate. The net returns were $15,600. The Mexico Consolidated M. & S. Co., operating mines at San Pedro, near Guanaceví, Durango, reports that from January 1 to November 1, 1909, the profits from the ore milled amounted to $350,000, and that the net value of the ore reserves for January 1909 was $370,000. As a result of development the reserves had been increased to $851,500 by June of this year. The cost of the mining operations have been decreased and the debts of the company have also been reduced. The mill has been re-built and the mine-stores well stocked. The new mill will start in January and the general prospects of the company are considered to be good. E. Stallforth is president and Alberto Stallforth treasurer.

The Batopilas M. Co. reports that during the first four months operation of its cyanide plant to November 30, 717 tons of second-class concentrate and pan tailing was treated, containing 90,406 oz. silver, of which 87,372 were recovered, showing that the extraction was 96.64%. The average saving by the cyanide plant has been approximately 60% in treatment costs, and 11.64% in silver content, or $12,000 U. S. currency.

Chihuahua, Mexico

MEXICO.

Santa Gertrudis, Pachuca.—Sultepec.—Zacualpan.—Hydro-Electric Power Developments.—Zacatecas.—Mining Law.

News comes from Pachuca that all the necessary machinery for the La Blanca mill has been purchased, and the construction work will be pushed ahead rapidly. It is expected that within eight months the mill will be running. There are persistent rumors to the effect that the Camp Bird company has given the eight days notice necessary to the Santa Gertrúdis company, and that the property will be taken over on January 1. This rumor is, however, denied by the representatives of the Camp Bird company here in the city, but the effect has been noticeable on the local stock exchange, as Santa Gertrúdis shares rose to ₱145, though few shares changed hands. The new cyanide plant of the Santa Gertrúdis company that is being erected on the Guadalupe patio is nearly completed. The first of the completed tanks have already been tested and proved satisfactory, and the whole plant will be completed about the end of January.

There seems to be no question that the existing power companies in the Pachuca district cannot supply all the power demanded, and the engineers of the local power company are searching for new sources of power. They are rushing the work on the new canal. This canal is 42 kilometres long and is being constructed by the Cia. Bancaria de Obras y Bienes Raices, S. A., of Mexico City. It has about 2000 men on the work, and according to the terms of the contract the canal must be completed by September 1910, so that the water by that date can reach the new power-plant being erected at Tepetongo. The Mexican Light & Power Co. is about to start active construction on the new line from Tepeapulco to Pachuca. This, together with the fact that the existing power companies will increase their plants, will insure an abundance of power for mining companies before the end of next year.

Another rich discovery is reported from the Coronas mine, at Sultepec, State of Mexico. A cross-cut below the bottom of winze No. 6 cut the main vein and developed a width of 12 metres of good milling ore, and then cut a rich streak of over 1½ metres which assays 5 kg. silver and 15 gm. gold. So far the hanging wall has not been reached. The Coronas mine is owned by the Seguranza Mining Co. The construction of the electric power line has now been completed up to this mine, and the power is being supplied so that the 100-ton mill may be started this week.

A new strike of high-grade shipping ore is reported from the Alberta mine, owned by the Coahuila Mining & Smelting Co. Development work is being pushed as rapidly as possible. W. H. Williams is in charge. The result of the work on the La Fortuna mine in Zacualpan has shown that the property is really valuable. Work will be continued on a large scale. The bulk of the stock in the company is owned by local merchants in Pachuca.

The Chapala Hydro-Electric & Irrigation Co. is arranging to increase its sphere of operation. It has made a contract with the State Government of Aguascalientes to run power-lines to the important mines of that State. A new company is to be formed that will be controlled by the Chapala Hydro-Electric company for the purpose of consolidating the local power, light, and tramway interests. Other contracts of a similar nature are being arranged with the State Governments of Zacatecas and San Luis Potosí. The transmission lines from the present site of the main power-plant of the company to the centre of distribution of the various States will be: to Aguascalientes, 108 miles; to Zacatecas, 160; to San Luis Potosí, 182. To meet this largely increased demand for power, the Chapala company will have to build another large power-plant. With this object in view, surveys have been made, and a site selected on the Santiago river, where a total head can be obtained of 1600 ft., with an ultimate capacity of 90,000 hp. This will entail the construction of a canal 26 kilometres long to carry the water of the Santiago river from Juanacatlán falls to Las Juntas. The distribution of cheap power to all the mining camps of these three States will mean a great revival of mining in this section of Mexico. At Zacualpán there are great dumps of low-grade milling ore which it will be possible to handle economically, particularly those of the Veta Grande, which are among the largest in the Republic.

During the past year mining has been dull at Zacatecas. A great many properties have been lying idle, and others have been kept going by dint of rigid economies and by avoiding all dead-work. The famous old mines of San Rafael, Cantera, Veta Grande, Austriana, and Mala Noche, have been entirely idle during 1909. The San Rafael has sold its ore-dumps to the National railroad for ballast, subject to a preliminary sorting to save any ore that will pay. Occasional pumping operations are carried on to keep the water-level down to a point within control. The property is at present being sampled by Carpenter, Brennon & Ryan, of Mexico City, on behalf of the owners. The only important event that has taken place at Zacatecas during the year has been the completion and blowing in of the Magistral smelter on March 31 of last year. It has been running steadily ever since, supplied by ores from the Magistral mines, and has proved succesful.

The other mines that have been at work in the camp are as follows: The El Bote Mining Co. has remodeled its milling plant and has added a cyanide plant. This company

is developing cheap power with producer-gas engines. The mine has immense dumps estimated to contain upward of 800,000 tons of milling ore, and the company is now re-working these. A considerable amount of exploration has been done during the year, and the deepest shaft is now down 1100 ft. The Zaragosa mines have been worked steadily and a new concentrating plant has been put in. A considerable amount of high-grade ore has been taken out by the lessees from the San Roberto. The lessee is Theodore Van Wagenen, of the Cape Copper Co. of London, who holds the property under bond. This ore has been taken from superficial development, the deepest workings being only 80 metres. Goertz-Doers, of London, hold an option on the Rio Tinto property and have done a considerable amount of development on the main vein, which is over 30 ft. wide and contains lead and silver. In sinking, more water was encountered than could be conveniently handled with the pumps available, so that work has been suspended, and the management intends to sink a new shaft. A custom mill equipped with a cyanide plant is being erected on the outskirts of the city, and will be ready to start operations in about a month. There is no doubt that it will materially assist the small mines of the district. The prospect of introducing electric power into the camp within a short time is causing a slight boom at present, and it looks as though the coming year will be more prosperous. The new Mexican mining law which comes into force in January was affirmed by the Senate without any alteration from the bill as passed in June by the Chamber of Deputies.

GOLDFIELD, NEVADA.

Goldfield Annual Output.—Milling Developments.—Goldfied Consolidated.— Florence Goldfield. — Combination Fraction. — Sandstorm & Kendall —C. O. D. Consolidated.

Estimates made by mining men familiar with conditions in the Goldfield district, and who are regarded as competent authorities, place the gold production of the Goldfield district for the year 1909 at approximately $10,000,000. Of this sum the Consolidated Mines Co. has produced about $6,500,000 gross. Exact figures of production will be difficult to obtain for some time, as final returns from ore and bullion shipments and from concentrate will not be available for at least a month after shipment has been made. While business and financial conditions during the past year have militated against the beginning of development in virgin territory, there have been some encouraging results from work upon what is known as outside ground, and the results of development upon the better known mines of the inside part of the district have been of the greatest importance and far-reaching in their influence upon the mining industry in Nevada.

While much has been written of the exceedingly rich ore found in the Goldfield district, it is realized that the district must eventually rely on lower grade milling ores for its chief revenue, and this has influenced the railroads in making Goldfield the railroad centre of southern Nevada. Already the terminus of three railroads, the Tonopah & Goldfield, Tonopah & Tidewater, and the Las Vegas & Tonopah, the camp will have another road tapping the timber country of Mono and Inyo counties in California, and as a division point and terminus of the Ely-Goldfield road it will be an important point on a system that will practically be a trans-continental line. This will afford a shorter haul to the smelters of Utah for the silicious ore of the district that is being keenly sought by the smelting companies.

Foremost in importance among the year's developments in Goldfield has been the upbuilding of the great mines and reduction works of the Consolidated Mines Co. On December 26, 1908, the new 100-stamp mill was first put in operation, with a stated daily capacity of 600 tons. When the announcement was first made by the management that such a mill would be built to treat the product of the mines at a given cost per ton, and to start its work upon a specific date, mining and milling men were skeptical, but every promise of the management was kept to the letter and the plant has surpassed in efficiency the expectations of its founders. For months past the 100 stamps have been treating a daily average of 650 tons, and on December 26, one year to the day from starting the machinery, three Chilean mills of the new equipment were placed in commission. The entire plant will be treating 900 tons per day before this is on the press. Development in the mines of the Consolidated company has been carried on vigorously and on a larger scale than heretofore. A large production is being made from all four centres, the Red Top, Clermont, Mohawk, and Combination. The doubt existing a year ago as to the persistence of the orebodies in depth has been dispelled by the discovery of the richest bonanzas in the district at depths far below any attained at that time. Sill floors have been prepared at the 750-ft. level in ore 20 ft. wide, averaging $500 per ton, and this ore-shoot has been developed on three levels, at the 600, 750, and 900-ft., for over 350 ft., with cross-veins of almost equal proportions. The deepest level in the mines, 1000 ft., is now nearing the point at which, from indications above, it is expected that the same ore-shoot will be penetrated. The underground workings in these mines now total nearly 40 miles in length.

Next in importance come the new developments in the Florence Goldfield. The improvements to that company's mill increased its capacity to 160 tons per day. In this mine a large tonnage of excellent ore has been blocked. Old lease workings in which the ore was supposed to have been exhausted are proving to contain great wealth, in addition to new discoveries of rich material. The deepest workings of the Florence are but 500 ft., but the main shaft will be sunk to a depth of 1000, and enlarged to three compartments. The management claims to have sufficient ore blocked in workings near the main shaft and above the 400-ft. level to supply the mill at full capacity for more than a year. The saving effected is nearly 98 per cent.

The Combination Fraction mine during several months made a production of 80 tons per day of $25 ore, but its present reserves of paying ore are depleted, and the leased mill is now idle, although a force of 30 men is employed in developing, chiefly at the 500-ft. level, while the main shaft is being sunk from the 600 to the 800-ft. level. The ore-shoot opened in September above the 380-ft. level has been stoped out and the same vein, carrying ore of fair milling grade, has been opened at the 500-ft. level. Nothing of value was developed in driving a cross-cut to the west at the 600-ft. level, and this is being extended by the Consolidated company across the Combination claim to the January. A lease for a term of five years has been granted to a group of local and Eastern operators embracing the main workings and plant of the C. O. D. Consolidated Co. on the Gold Bar claim, and the lessees will shortly begin the construction of a 50-ton mill. The only work on the C. O. D. this year has been that carried on from the Victor shaft from which a small production of high-grade ore carrying a large percentage of copper was made. On the main workings over 1000 tons of free-milling ore averaging $25 per ton remain, which will be treated by the lessees in their mill, which will also treat the product of the Thomas lease on Columbia mountain.

A consolidation of the Sandstorm and Kendall was effected a short time ago by the formation of a leasing company which secures a long-term lease on both properties, and funds for development will be raised by means of levying an assessment on the stock. Little work has been done on the Jumbo Extension, but lately lessees have taken rich ore from the Gold Coin claim near Diamondfield. Several lessees continue operations on the Atlanta with three shafts past the 600-ft. level and new ground is being opened. The ground of the Goldfield Daisy Co. is practically all leased, with high-grade ore exposed at several points. The Cracker Jack is being developed by lessees. A new lessee has begun work on the Booth, near the boundary of the Red Top; rich ore has been mined by lessees on the Velvet and St. Ives claims of the Goldfield Merger Mines Co. Company work was suspended for the time being on the Great Bend, where one lessee found some good ore at the 400-ft. level; no work is being done on the Red Hills; a good vein has been exposed and is being followed by driving on the Nancy Donaldson; lessees exposed paying ore on the Blue Bull; and shipments were made from the Goldfield Belmont.

BUTTE, MONTANA.

December Output. — Switchmen's Strike. — Butte & Superior and Butte & New York Consolidation.—East Butte Smelter.—Barnes-King.

The December production by the Butte mining companies will not exceed 16,000,000 lb. of copper, which is about 12,000,000 less than normal. This is due to the strike of switchmen on the Great Northern and Northern Pacific railroads, preventing the transportation of ore to smelter and stopping the supply of coal.

Official announcement has been made that the Butte & Superior Copper Mining Co. has acquired a controlling interest in the Butte-Milwaukee Mining Co., owner of the Colonel Sellers group of claims. It is provided that the stock of the Butte-Milwaukee shall be exchanged for that of the Butte & New York and the latter will be turned over to the Butte & Superior, the exchange to be on a basis of two and a half of Butte-Milwaukee for one share of Butte & New York, giving the Butte-Milwaukee stock a value of 50c. per share. The acquisition, however, will cost the Butte & Superior 40c. per share for Butte-Milwaukee. The Butte & Superior has agreed with the

Montana.

Butte-Milwaukee to sink the shaft on the Colonel Sellers claim to 1600 ft. and connect with the Blackrock mine of the Butte & Superior. By this arrangement both companies will save money in order to comply with the new laws of Montana requiring two shafts for each property in order to insure safety and provide better ventilation. The Butte-Milwaukee has half a dozen good claims, all paid for, and has a splendid plant on the Colonel Sellers, the shaft of which is about 700 ft. deep. One of the best and largest veins on 'the hill', judging by surface showings, is on the Colonel Sellers and Bird claims, two properties adjoining and including 2400 ft. along the vein.

The East Butte Copper Mining Co. is making preparations to install another furnace in its smelter, and put in a sampling mill. A stone crusher is being installed at the company's lime quarries east of Butte and a new loading trestle has been completed. A new quarry is also being opened. The company made a new and important strike in the Pittsmont mine last week on the 800-ft. level, about 1000 ft. north of the main workings on the Silver Bow vein. The orebody has an average width of 4 ft. and gives an average assay of 6.5% copper, and is high in silver. The company has 1400 ft. on this vein.

The directors of the Barnes-King Development Co., acting on a suggestion of some of the stockholders, are looking for a good property in which to invest the treasury-surplus of the concern instead of dissipating it in a discouraging effort to make something out of the fraudulent Barnes-King mines. They have been negotiating for the purchase of a property in Idaho, on the line of the new Pittsburg & Gilmore railroad in which, reports say, $250,000 worth of ore is blocked out.

WASHINGTON, D. C.

Geological Survey Estimate of Production. — Coal Increases 10 Per Cent.—Metal Output Larger.—Petroleum Declines.

Estimates of production made by the Geological Survey indicate that 1909 will prove to have been in many particulars a prosperous year for the mineral industries. E. W. Parker estimates that the increase in coal production over that of 1908 amounted to between 8 and 10%, and that the total output amounted to between 440,000,000 and 450,000,000 tons. This, while highly satisfactory, fell short of the record production in 1907. Pig iron was made, according to E. C. Harder, to the amount of 25,500,000 long tons, which is 9,500,000 more than in 1908, and just short of the record output of 1907. The iron ore output is placed at 51,000,000 tons, which again greatly exceeds that for 1908, and is only slightly less than for the preceding year. Copper, lead, zinc, all had a prosperous year, and increased outputs are certain. Quicksilver is estimated by H. D. McCaskey at 20,425 flasks, which at the average New York price of $46.17 would be worth $943,022. Tungsten concentrate, according to F. L. Hess, to the value of $746,130 were sold and important increases occurred in other materials. The total petroleum production, as estimated by David T. Day, was between 173,000,000 and 178,000,000 bbl., as against 179,572,479 in 1908. The decrease was less than had been expected in view of the great accumulation of stocks during the preceding year. This accumulation occurred entirely in States east of the Rocky Mountains that have no trade connection with California, and this State, therefore, showed a great gain, in which nearly all its pools participated.

That the production of 1908 was more than the market could reasonably stand was shown by the decline in price in the Eastern and Middle fields. The price for Pennsylvania crude oil, which had been $1.78 per bbl., began to decline on May 3, and had fallen to $1.43 by December 9. A cut was made in Lima oil from $1.04 to 84c.; in Illinois oil from 68 to 60c., and in the Oklahoma fields the price likewise declined from 41 to 35 cents.

There were no significant discoveries of new fields during the year, although outside of the well known regions prospecting was particularly active in Wyoming, Utah, and New Mexico. The decline in southern Louisiana was offset by increase in production in the Caddo field under the stimulus due to the starting of work on the refinery of the Standard Oil Co., at Baton Rouge, and on a pipe-line connecting it with the Caddo field. The significant feature in this drilling has been the success of persistent efforts to discover oil at lower levels, particularly north and northwest of the former productive region. Normal conditions prevailed in Texas, with a small decline.

In Oklahoma the strenuous efforts of the Producers' Association to suspend drilling operations was successful to the point of reducing production, and even stocks. The transportation facilities improved throughout the year. The assurance of a pipe-line to Baton Rouge, Louisiana, has given to the operators confidence in their ability to dispose of the product on favorable terms and has put new life into the field. In September an exceptionally large gusher was developed five miles north of Okmulgee. The success of this well led to the development of the Pearson pool, with the usual period of active speculation in leases. Drilling was greatly hindered by the extreme drought.

California now stands first in oil production, producing fully 10,000,000 bbl. more than Oklahoma, which ranks second. Developments begun in 1908 continued with increasing rapidity in 1909, many sections producing wells of large capacity. One of the important events of the year—an event that created excitement in oil circles—was the drilling in September of the Silver Tip well on Sec. 6, Coalinga field. This is said to be, with the possible exception of the Hartnell well, of the Union Oil Co., drilled at Santa Maria in 1904, the greatest well ever drilled in the State. Other important developments have extended the Coalinga field to the west and south. Successful wells drilled in the Sunset, Midway, and other districts, show the wonderful richness of the oil fields of the State.

General Mining News.

ARIZONA.

COCHISE COUNTY.

A streak of oxide ore was opened on the 1300-ft. level of the Cole shaft of the Superior & Pittsburg. Work has been resumed in the Biggs shaft.——The shaft at the Bisbee & Arizona, six miles south of Bisbee, is being unwatered and the property will be prospected by diamond-drilling. R. Harlan is manager.——Operations are to be resumed in the Empire State mine in the Bisbee district and the main adit will be advanced 500 ft.——A 30-ft. body of oxide ore has been opened in the porphyry of the Sacramento shaft of the Copper Queen company. The ore previously opened has been on the contacts of the limestone and porphyry.——A boiler, hoist, and No. 5 Cameron pump have been purchased by the California & Paradise Mining Co., and will be installed at the property near Paradise.——F. H. Mitchell, manager for the Johnson Copper Co., has purchased a 40-hp. hoist and air-compressor for the property at Johnson, and will sink the shaft to the 1000-ft. level.

GILA COUNTY.

(Special Correspondence).—Homer Crumrine, president of the Arizona-Colorado Copper Belt & Gold Mining & Milling Co., has been spending the past two weeks in Globe outlining the future policy in regard to the development work at the company's property three miles north of Globe. A test shipment of ore from the 800-ft. level will soon be made to the El Paso smelter which will, to a large degree, determine the plan to be followed in the future. S. C. Phillips is superintendent.——Recent work on the 300-ft. level of the Warrior mine in Miami district has opened an orebody in a cross-cut from the main drift, which, at the present face of the cross-cut, averages 11% copper. A. Bail is superintendent. M. E. McCarthy is general manager of the Warrior, Cordova, and Live Oak mines, all of the same district.——The Globe Mining Co., operating the Mineral Farm property in the northern part of Copper Hill district, has just finished unwatering the 415-ft. vertical shaft preparatory to resuming cross-cutting on the 400-ft. level. At another part of the Mineral Farm property a lode containing much hematite has been cut in an adit 350 ft. long. This lode is thought to be the Yuma vein, which yielded a considerable amount of ore during the time the Old Dominion Copper Mining & Smelting Co. worked it on its property adjoining the Mineral Farm.

Globe, December 31.

Map of Arizona.

MARICOPA COUNTY.

A new mill containing Nissen stamps is being erected at the Vulture mine, at Vulture, and an aerial tram built from the mine to the mill. A large body of high-grade ore is being opened on the 600-ft. level preparatory to starting the new plant and the old mill is being run on ore mined above this. Robert Johns is superintendent.——At the Interior, southwest of Wickenburg, the shaft is down 100 ft., and the company is planning the installation of power-drills to facilitate the work.

MOHAVE COUNTY.

At the Keystone mine, in the Mineral Park district, which has been recently taken over by S. R. Porter and associates of Los Angeles, the shaft has been re-timbered and a new steam-hoist and air-compressor is being installed. The mine has been idle for 35 years as the ore is complex, containing gold, silver, lead, copper, and zinc. Much of the ore is high grade and the company will confine its present operations to development work.——The Metallic Accident, in the same district, has been bonded to Carl Hand.——A new shaft has been started at the Pinkham mine between Mineral Park and Chloride.——A. P. Anderson, representing the United States Smelting, Refining & Mining Co., has secured a ten-year bond and option on the Tennessee and Empire mines in the Chloride district.——F. M. Drescher, of Prescott, purchased the Surprise, Great Eastern, Ore Shoot, Little Bessie, and Gold Beginner group of claims in the San Francisco district.——The Hercules mine, in the same district, is to be equipped with new machinery and a cyanide annex is to be added to the mill. A. W. Brattlund is manager.

CALIFORNIA.

EL DORADO COUNTY.

(Special Correspondence).—The owners of the Gold Hill are considering the installation of considerable equipment at the property.——At the Mount Pleasant a vein of $22 ore is being opened at the 310-ft. level. Several shoots of ore, assaying over $15 per ton, are being worked above this point. The No. 2 shaft has been unwatered to the 300-ft. level and several drifts extended since the present company took charge about three months ago. The payment of dividends has been resumed. A. V. Judson is manager.——At the Capitola a 40-ft. vein has been opened at a depth of 100 ft. Assays range from $1 to $40 per ton. John F. Cowan is manager.——Eastern capitalists have taken an option on the Nellie Hume property.——Operations will be shortly resumed on the Pease mine, near Greenwood.——The Jasper has resumed operations.

Placerville, December 31.

MERCED COUNTY.

The Yosemite Dredging & Mining Co., operating on the Merced river, paid an initial dividend of 2oc. per share, together with an extra dividend of the same amount. The company is operating a Bucyrus dredge on a 340-acre tract.

NEVADA COUNTY.

(Special Correspondence).—The North Star Co. has declared a dividend of $300,000 for the last quarter of 1909, making a total of 23% in dividends on the $2,500,000 capitalization for the year. The mine produced 100,000 tons of ore for the year, average value $12.50 per ton, making a total of $1,250,000. Owing to the vast amount of ore on hand it was found necessary to lay off 40 employees a few days ago. A. D. Foote is manager.——Leases have been granted on several blocks in the Idaho-Maryland, and considerable ground will be worked by this method.——Four machines are at work in the bottom of the Empire shaft and sinking is progressing rapidly. The electric pumps are easily handling the water. It is estimated that the production of this property for 1909 amounted to approximately $900,000. George W. Starr is manager.——The shaft at the Brunswick has passed the 125-ft. point.——Contracts have been let for the sinking of the shaft at the Pittsburg to a point 140 ft. below the 1000-ft. level, and for the extension of the drifts on the 700 and 900-ft. levels an additional distance of 250 ft. The mill is operating on ore from the 700-ft. workings.——The driving of a lower adit at the Sunshine will soon commence. In the upper workings the vein is 24

in. wide, and assays over $10 per ton.——The 500-ft. crosscut adit at the Oakman will be extended 200 ft. farther to cut the main vein.——Preparations have been made to resume operations at the Red Point mine, in the Washington district.——The main vein has been opened 300 ft. from the adit at the Fairview. It is 10 ft. wide and samples average $30 per ton. C. M. Wilson is superintendent.——The Red Cross has installed a Huntington mill and Dodge crusher. ——The Yuba Consolidated Mining Co. has made the final payment on the Grey Eagle mine, and paid up back taxes

Tool Car, Central Shaft, North Star Mine.

on the Yuba, Grey Eagle, and Bluejay Extension. Dan McFall is superintendent.——It is reported that work will be resumed at the Eureka in the spring.——The Lucky vein has been cut at the Union Hill. Clifford Graham is superintendent.——The Champion is being operated steadily by a large force of lessees. The deal for the transfer of the mine to Chicago people is still pending.

Grass Valley, January 2.

SAN BERNARDINO COUNTY.

(Special Correspondence).—The financial difficulties of the Orange Blossom mine have been adjusted and John Denair, president of the company, announces that work will be resumed on January 1.——The Orange Blossom Extension will resume within a short time. It is proposed to install a pumping plant and sink the 715-ft. shaft to greater depth. W. H. Holcomb is manager.——It is announced that a Catton oil-burning smelter will be erected at Silver Lake to handle custom ores.——The F. M. Smith interests have decided to commence work on the Mount Blanc borax deposits. Mining will still continue at the Lila C., but on a smaller scale. The Mount Blanc deposits can be worked for 50c. per ton, while it costs $1.50 to mine the deposits of the Lila C. and transport the borax to the railroad.——It is reported that the Swift Packing Co., of Chicago, is interested in the development of eight promising potash claims 22 miles from Tecopah.——Announcement has been made that the Needles smelter will resume operations on custom ore in the near future. This means the reopening of numerous small properties in the Needles district.

San Bernardino, December 30.

TRINITY COUNTY.

The Ruggles property, situated three miles north of Carrville, has been bonded to J. O. Nelson, of Goldfield. The amount involved in the bond has not been made public.

TUOLUMNE COUNTY.

(Special Correspondence).—Phenomenally rich ore has been opened on the 1300-ft. level of the App. The vein is over 2 ft. wide.——The sinking of the Omega shaft an additional 400 ft. is under way. Good ore has been developed in the main workings.——The shaft at the Dutch mine has been placed in excellent shape and the overhauling of the mill is progressing rapidly. Active production will soon be resumed.——Good ore is being opened at the Hancock.

Tuolumne, December 31.

COLORADO.

CLEAR CREEK COUNTY.

(Special Correspondence).—As soon as the weather breaks work will be started on a 50-ton mill for the Kennedy Gold Mining Co.——A body of smelting ore 2 ft. wide has been uncovered on the Charter vein cut by the La Moe adit 1250 ft. from the entrance. J. J. Bonner is manager. ——G. D. Parks has secured the Atlantic No. 1 and 2 lode mining claims, situated on Covode mountain, under bond and lease from F. L. Peck. Work has been put under way in the adit and mill ore is now being extracted. The old Clear Creek mill at Empire Station has been secured and the machinery is being overhauled.——A body of smelting ore 18 in. wide has just been uncovered on the Anamosa vein which is being worked through the Rochester adit. A shipment of 20 tons made this week assayed 625 oz. silver per ton. O. W. Mann is manager.

Georgetown, December 31.

GILPIN COUNTY.

(Special Correspondence).—The Chase mine, in Willis gulch, has been taken over by Forbes Rickard, of Denver, representing New York and Boston capitalists. Work was put under way last week in cleaning out the workings preparatory to starting development. H. C. Willis is superintendent.——Work has been started in the remodeling of the mill building that is to be used by the Denver Mining & Reduction Co., McFarlane & Co. having been awarded the contract for the installation of the equipment.——The St. Anthony property, on Negro hill, has been taken under option by Denver men. The shaft, down 185 ft., is being cleaned out and re-timbered and will be sunk another 100 feet.

Central City, January 3.

TELLER COUNTY.

Dividends to the amount of $217,411 were paid in December by Cripple Creek mining companies as follows: United Gold Mines Co., 1c. per share, $40,000; Elkton Consolidated, 2c., $50,000; Jerry Johnson, 1c., $25,000; El Paso Consolidated, 1c., $24,500; Granite, 1c., $16,000; Doctor-Jack Pot, $15,000; Acacia Gold Mining, 1c., $14,500; Mary McKinney, 1c., $13,042; Free Coinage Gold Mining & Milling, $10,000; and Gold King Mining Co., 1c., $9368.——A rich streak has been opened by lessees on the Pueblo claim of the Free Coinage Gold Mining Co., and the ore is being sacked for shipment. Assays have been as high as 2400 oz. gold per ton.——The Success Mining Co., operating the Gold Hill mine, under lease, shipped two cars of ore that averaged $30 per ton.——A rich shoot was opened recently on the 600-ft. level of the Bonanza King mine on Gold hill, operated by the Gold Issue Mining Co., and several tons of 10-oz. ore shipped.——A spray washer has been installed on the dump of the Vindicator No. 1 shaft under lease to John Sharpe.

MISSOURI.

JASPER COUNTY.

(Special Correspondence).—Steve Chitwood, operating on a lease of the Connor land at Prosperity, has bought a 200-ton mill for this mine. Five hand-jigs are working on the lease, cleaning dirt estimated to run from 10 to 20%. The ore is found at 195 ft., and unlike most properties operating at that depth, is in soft dirt instead of sheet ground. A number of drill-holes have blocked out the ore for some distance from the shaft.——The old Lehigh camp, near Carl Junction, is to have six new mills in the near future. Two are to be erected on the Jubilee property, one on the Knight land, one on the Hanway lease, one on the Excelsior lease, and the sixth on the sub-lease operated by George Meese. The ore in this community is free in character and occurs from 80 to 100 ft.——Freeman & Miller are planning a new mill for a lease of the Katherine land at Zincite. The hand-jig equipment on the land is proving inadequate, as much ore is lost in the tailing. The ore is

taken from 170 ft. where a 14-ft. face has been exposed. ——W. W. Sylvester, operating on a portion of the Shifferdecker land, southeast of Duenweg, is planning a large mill for that property. The ore is taken from 116 ft. in soft ground, though no timbering is required, as a cap-rock is above the ore. There is almost no development in this immediate vicinity.——A good prospect is being worked on a sub-lease of the Connor land, west of Joplin, where a large pile of crushed rock is accumulating. A part of the ore is being cleaned on hand-jigs, but owing to the character of the ore a great part has to be stored awaiting a mill. A shaft is down 100 ft., which shows a 12-ft. face.——The Puritan company, on the Old Dominion ground, is opening a good body at a deeper level which is proving much richer than the former shallow development. The lower run occurs from 118 to 135 ft., as shown in three drill-holes. Estimates of the ore are from 10 to 20%. The company has two shafts, one already in the deep run, and the mill shaft is to be sunk at once.——A rich zinc find has been made in the Sarcoxie camp by J. W. Boyd on a lease of the McNallie farm. Ore was cut in the second hole at a depth of 20 ft., the cuttings being especially good from 25 to 30 feet.

Joplin, December 30.

MONTANA.

SILVER BOW COUNTY.

(Special Correspondence).—The secrecy that is maintained by the North Butte management regarding development on the new levels of the mine is giving rise to unfavorable reports about the property. The information coming from the mine is to the effect that the new levels, both on the Edith May and Jessie veins, continue disappointing. The ore in the Edith May, on the 2000 and 2200-ft. levels, since the drift passed the faulted portion of the vein, has been regular but of a low grade.——The experience of Parrot stock during the past few weeks, in which it dropped 9 to 10 points, was not due to any change in the condition of the mines. The Parrot mine was shut down, with many other properties, on account of the strike of railroad switchmen, and the production was limited to the Little Mina. There has been no recent change in the showing in either mine.——The Tuolumne Copper Mining Co. has resumed the shipment of ore, hauling it by team to the smelter. There is no change in the controversy between the Tuolumne and North Butte over the Jessie vein, and both companies are engaged in surveying and doing development work for the purpose of proving ownership of the vein in question.

Butte, December 31.

NEVADA.

ELKO COUNTY.

(Special Correspondence).—The Jarbidge district, situated in the northern part of this county, is attracting attention of mining men and many claims have been staked, mostly by people from Twin Falls, Bruneau, and Boise, Idaho. Ore specimens brought to Boise assay offices consist of quartz containing free gold and a little tellurium. The North Star Gold Mining & Milling Co. has been organized to develop claims there and is headed by J. E. Clinton, of Boise, M. E. Reynolds, of Bruneau, and D. A. Born. The camp is 85 miles southwest from Twin Falls, and much of the travel there is by that route.

Twin Falls, December 29.

NYE COUNTY.

(Special Correspondence).—Julius Lemle, Charles Ryan, and A. B. Gibson, have been appointed a committee to carry on action against A. C. Eisen, president of the Mayflower Consolidated Leasing Co., by dissatisfied stockholders of the Mayflower Consolidated Co. Those opposed to turning over of the mine to the leasing company for a period of 20 years assert that the property has been mismanaged and will ask the courts to appoint a receiver for the property. The stockholders opposed to the transfer have levied an assessment of 1c. per share in order to raise a sum to carry on litigation.——The Belmont vein has been opened on the 1100-ft. level of the Belmont. It is 8 ft. wide with streaks assaying $60 to $100 per ton. The entire body is good ore and that broken in the course of developments is shipped to the Mammoth smelter at Kennett, California. The mill remains idle.——The litigation affecting the Old Oriental mine, at Gold mountain, has been decided in favor of the original locator M. J. Drumm and associates. Arrangements are being made to commence work.——The Marvel mine, at Lida, is sending out small shipments of rich copper ore to Goldfield. The last shipment averaged 37% copper. The shaft is down 75 ft. D. P. Marvel is managing owner.——The Tonopah Mining Co. has completed the shaft-house at the Sand Grass claim and the work of sinking the new 3-compartment shaft is progressing steadily. A regular dividend of 25c. and an extra one of 10c. have been declared, making a total of $350,000, or $1,400,000 for 1909. Since its organization this company has disbursed over $5,300,000 to stockholders.——The directors of the Belmont have decided to move the mill from Millers to Tonopah.——A 3-ft. body of $20 ore has been opened for a distance of 102 ft. on the 50-ft. level of the Nevada Johnnie. The main shaft is down 122 ft. with another down 78 ft.——The Peterson mill is running steadily at Manhattan on Stray Dog ore. The last shipment of bullion amounted to $4000.

Rhyolite, December 30.

WHITE PINE COUNTY.

(Special Correspondence).—The Nevada Consolidated is taking out another slice at the glory hole which will widen the pit 42 ft. This is on the east side, where work is now centered. On the third terrace an unexpected body of good ore has been exposed.——The raise in the 5-compartment Giroux shaft is rapidly nearing the surface and prospecting with diamond-drills continues in the Alpha shaft. The spur from the mines to the tracks of the Nevada Northern is nearing completion.——It is reported that the McDonald Ely will resume operations within a few weeks.——The west cross-cut on the 400-ft. level of the Zack shaft has cut 25 ft. of low-grade oxidized ore in the leached porphyry formation. The Zack shaft will be sunk deeper to cut the sulphide zone. S. M. Levy is manager.——The Buckhorn Fraction has been taken over by the Cole-Ryan interests. ——Developments at Boston-Ely continue on a vigorous scale.

Ely, December 30.

OREGON.

BAKER COUNTY.

(Special Correspondence).—The Lewisohns, of New York, have a force of between 50 and 60 men on the Snake river, in this county, developing the Iron Dyke mine and the McDougall group of copper claims. The Iron Dyke has 200,000 tons of ore blocked out. They also have a 20-year contract on the total output of the Arkansas mine across the river, and are opening the Iron Mountain group where there is more than 100,000 tons of iron exposed, which will be used for fluxing purposes. The proposed operations include the erection of a 300-ton smelter, between the Iron Dyke and Ballard's landing, in the very near future. W. B. Fisher is manager.——While driving east in the Rainbow mine on the 240-ft. level an orebody 13 ft. in width was opened which milled $39.50 per ton. Previous to this engineers have estimated the ore in sight to be worth about $1,500,000 gross, the average value for the whole mine being about $24 per ton, of which 80% is free gold.——At the Humboldt mine, adjoining the Rainbow, 35 men are employed developing the property and milling 40 tons of ore per day. The mine is equipped with ten 875-lb. stamps and six Johnson concentrators. The ore averages about $10 per ton, 70% of which is free milling. The total saving is 93%. The mine produces some high-grade shipping ore.——The Poorman group of eight copper claims, situated 22 miles northeast of Baker City, and owned by the Oregon-Idaho Investment Co., has been surveyed for patent. The outcrop on this property is 200 ft. wide and over 2000 ft. long. A crew of seven men is employed and at 150 ft. the orebody is opened for a distance of 500 ft. in length and 70 ft. in width, leaving 130 ft. more cross-cutting before reaching the hanging wall. The last sampling in cross-cut No. 3 across the face gave 2.2% copper, 0.3 oz. silver, and $4.30 gold per ton.——The Highland mine, on Rock creek, is ship-

ping crude ore regularly to the Baker City sampling works. The last shipment of 40 tons netted the company $2740.85, after deducting smelting and railroad charges.——The Cornucopia Mines Co. is now shipping its concentrate to the Baker City sampling works. The Cornucopia concentrate ranges in value from $100 to $250 per ton.

Baker City, December 30.

WALLOWA COUNTY.

D. G. Davies has completed the installation of a 400-hp. hydro-electric plant and 4800 ft. of 3-ft. continuous stave pipe at Joseph.

SOUTH DAKOTA.

LAWRENCE COUNTY.

Sinking has been resumed at the 200-ft. level of the Golden Crest shaft and a new level will be opened at the 300-ft. point. The attempt to resume work on the 200-ft. level has been abandoned temporarily and the ore will be worked through one of the other levels.

TEXAS.

JEFF DAVIS COUNTY.

James Ingie is doing extensive development work upon his zinc property, situated in the Capote mountains, near Valentine. It is stated that he has opened a body of rich ore and that regular shipments to the smelter will soon be started.

LLANO COUNTY.

(Special Correspondence).—Renewed activity in the Llano mining district, 100 miles northwest of Austin, is being shown, due largely to the prospects of the early building of a railroad into that district from the north, which will place it in close touch with the coal fields of Stephens and other counties. McCarty Moore, of Dallas, and associates, who own the Heath gold mine, situated five miles east of the town of Llano, will erect a 50-ton mill upon their property, and install a complete equipment of machinery in the mine. This mine is partly developed and has produced some rich ore.

Llano, December 30.

UTAH.

JUAB COUNTY.

A rich body of ore has been opened on the 300-ft. level of the Provo mine by the lessees. As the ore was found north of the shaft in the quartz it is thought that it will contain considerable gold. This shoot has been worked on the 160-ft. level and a winze will be sunk to connect the two.——A 30-ton shipment of lead ore netted the East Tintic De-

Tintic Smelter, Utah.

velopment Co. $1380. The company is now shipping two or three cars per week and will increase this output in the spring. A car of ore averaging 70% lead is to be sent out shortly.——The mineral right of the property owners of Eureka was sold to the Eureka City Mining Co. for $10,000. ——A stope has been opened from the drift on the 1600-ft. level of the Chief Consolidated and the ore is being forwarded to the smelter.——A churn-drill has been hauled to the Copper Jack mine in West Tintic and the property will be thoroughly prospected before any lateral work is undertaken. J. H. Webber is in charge of the development.

SUMMIT COUNTY.

The Daly West shaft has been completed to the 2100-ft. level and work through the No. 3 shaft of the Ontario Mining Co. stopped. A quarterly dividend of 30c. per share has been declared for January 15, totaling $54,000.——A new adit has been started on the McGregor group on Scott mountain, and considerable work is planned for the spring. ——Some excellent ore is being opened at the Iowa Copper mine in Thaynes canyon and a winze will be started in the Spooner drift.——A 12-ton motor and a new compressor is being installed at the Daly Judge power plant which will double the supply of compressed air for power in the mine. ——At the New York Bonanza the drift is in over 100 ft. and is expected to cut the ore shortly.——An assessment of 10c. per share has been levied on the capital stock of the Silver King Consolidated Mining Co., payable before January 17.

CANADA.

BRITISH COLUMBIA.

(Special Correspondence).—The ore shipment for the district of southeastern British Columbia will go over the 2,000,000-ton mark for the past year, showing an increase over 1908 of about 100,000 tons. The year closes with all of the big properties in operation and the outlook for 1910 far better than it was a year ago. Among the large mines that will produce in 1910 and which were closed down in 1909 will be the Sullivan group in East Kootenay, the Big Ledge zinc property on Arrow lake, and the No. 7 and New Dominion mines in the Boundary, as well as the B. C. Copper mines in Wellington.——The Vermillion Forks Mining & Development Co., Ltd., are now installing a hoisting plant and expect within a month to be producing 400 tons of coal per day. This property producing and the Nickel Plate operations being doubled will make a big gain in the Similkameen district in 1910.——Work is now going on steadily at the Slocan Star mine, which has been shut down several years owing to litigation. There is a good ore reserve in the property and it is expected that regular shipments will be begun at an early date.——The new general manager of the Crowsnest Pass Coal Co., Mr. Ashworth, states that the shipments from the Michel and Coal Creek mines are averaging about 4000 tons per day. The Fernie and Michel coke ovens are turning out about 800 tons per day at each place.——The Morrissey mines are shut down at present, and will not be given attention until the plan of development being carried out on the other two properties is nearly completed.——The Hedley Gold Mining Co., operating the Nickel Plate gold property at Hedley, has declared a dividend of 30c. per share, amounting in all to about $36,000. ——The Consolidated Mining & Smelting Co., of Canada, is going to build a two-mile tramway from the recently acquired No. 7 mine to the concentrator site at Boundary Falls, where a mill will be erected to treat the gold-quartz ore from this property.——The convention of those interested in the zinc mining industry of this locality was held December 15, and it is hoped that the movement will culminate in the building of a commercial zinc smelter near Rossland.——It is officially stated that work at the Kamloops mine will be resumed with a large working force in about six weeks. The Duluth men behind the deal, as soon as sufficient ore is taken out, intend to erect a smelter and tramway. E. C. Wallander is manager.——Colonel Eagleson, of Washington, D. C., has bonded 80 claims on Cadwalader creek, and if the experts report favorably on the ground, the syndicate he represents will spend $350,000 on a hydraulic plant in the spring.

Rossland, December 30.

MEXICO.

MEXICO.

A new company has been organized in Mexico City to extend the railroad system from Tezintian to Nautla. The company is capitalized for $5,000,000 all of which has been subscribed, and construction work will be started in a short time. The road will open a large tract of country rich in mineral and agricultural resources.

Personal.

Professional men are invited to send news of their engagements and travels. Such news is interesting to friends.

J. A. TAFF has gone to Utah.

FRANK H. PROBERT has gone to Boston.

WILLIAM BOARDMAN is in New York for a month.

F. L. BOSQUI is experimenting with vacuum filtration on the Rand.

H. R. NORSWORTHY is with the Ione Copper Co., Ione, California.

THEODORE GROSS sailed from New York on December 27 for London.

HORACE F. EVANS has removed from Grant's Pass to Portland, Oregon.

WHITMAN SYMMES has returned to Virginia City, Nevada, from San Francisco.

F. LYNWOOD GARRISON has returned to Philadelphia and will shortly visit Mexico.

ULYSES S. GRANT lectured at Evanston, Illinois, January 10, on 'Some Alaskan Glaciers'.

W. K. BETTY is visiting plants in the United States, studying American filtration methods.

JOHN S. OGLESBY, of Dallas, Texas, has been in San Francisco, Cal., and Yerington, Nevada.

LAFAYETTE HANCHETT will sail from San Francisco in February for a journey around the world.

FORBES RICKARD has returned from Mexico, and is now examining mines at Central City, Colorado.

ARTHUR H. LAWRY has returned from Nicaragua, and is at the Black Oak mine, Soulsbyville, California.

VICTOR TOMILIN is returning to Russia, and will go to the mines of the Syr-Darja Copper Co. in Turkestan.

JOHN B. FARISH, in company with his son, GEORGE E. FARISH, has opened offices at 25 Broad street, New York.

VICTOR E. TULL, the general manager of the Tubal Cain Copper & Manganese Mining Co., Olympic Mountains, Washington, is at the Palace Hotel for a stay of several months.

WALTER HARVEY WEED has returned to New York from the Southwest, having just completed his report upon the Tajo de Dolores mine at Guanajuato, which he examined for the Proprietary Mines Co. of America.

G. H. DOWELL, formerly with the American Smelting & Refining Co., and more lately metallurgist and ore-buyer for the Copper Queen Co., has been appointed superintendent of the Old Dominion Copper Mining & Smelting Co. in place of R. B. Hegardt, resigned.

Obituary.

CHARLES B. DUDLEY, the well known chemist and engineer, died at Altoona, Pennsylvania, December 21, after a brief illness only. A more extended notice of Mr. Dudley's life and work will be given later.

J. V. BOHN, superintendent of the Tennessee Copper Co.'s mines, died of typhoid fever at Copper Hill, Tennessee, Wednesday, December 22, 1909. Mr. Bohn was the second son of A. V. Bohn, of Leadville, Colorado. He was born in Dayton, Ohio, April 17, 1868, and entered Washington University, St. Louis, changed to Cornell, and completed his education at the Colorado School of Mines, Golden, Colorado. He then went to Butte, and thence to British Columbia, where he was connected with the smelter at Trail and the British American Investment Co., Ltd., at Rossland. He had charge of the Green Mountain mine for the American Smelters Securities Co., and then went to Chile as superintendent for the Braden Copper Co. He accepted a position with the Tennessee Copper Co. six months ago. In this short time he brought the company's mines and mine organization to a better condition, and materially facilitated the resumption of dividend payment in November by the betterments he introduced. Mr. Bohn leaves a widow, the eldest daughter of Admiral John A. Howell.

Supreme Court Decision on California Eight-Hour Law.

The following is the full text of the decision of the Supreme Court of California in the test cases brought to determine the constitutionality of the law restricting labor in mines and reduction works to eight hours per diem.

IN THE MATTER OF THE APPLICATION OF FRED J. MARTIN FOR A WRIT OF *Habeas Corpus* (Crim. No. 1539.)

Upon the application of Fred J. Martin a writ of *habeas corpus* was issued by this court. Martin had been arrested upon a charge of violating the terms of a statute entitled 'An act regulating the hours of employment in underground mines and in smelting and reduction works' (Stats. 1909, c. 181, p. 279), approved March 10, 1909. The provisions of the act are as follows:

"Section 1. That the period of employment for all persons who are employed or engaged in work in underground mines in search of minerals, whether base or precious, or who are engaged in such underground mines for other purposes, or who are employed or engaged in other underground workings, whether for the purpose of tunneling, making excavations, or to accomplish any other purpose or design, or who are employed in smelters and other institutions for the reduction or refining of ores or metals, shall not exceed eight hours within any twenty-four hours, and the hours of employment in such employment or work day shall be consecutive, excluding, however, any intermission of time for lunch or meals; *provided* that, in case of emergency where life or property is in imminent danger, the period may be a longer time during the continuance of the exigency or emergency.

"Sec. 2. Any person who shall violate any provision of this act, and any person who as foreman, manager, director, or officer of a corporation, or as the employer or superior officer of any person, shall command, persuade or allow any person to violate any provision of this act, shall be guilty of a misdemeanor and upon conviction shall be punished by a fine of not less than fifty dollars ($50) nor more than three hundred dollars ($300), or by imprisonment of not more than three months. And the court shall have discretion to impose both fine and imprisonment as herein provided.

"Sec. 3. All acts and parts of acts inconsistent with this act are hereby repealed."

It is not questioned by the petitioner that the complaint which furnished the basis for his arrest stated a violation of the terms of the act. His position is, however, that the act is void as being in contravention of constitutional provisions. The ground of attack usually advanced in cases of this character, namely, that the statute is in conflict with the guaranties of the XIVth amendment to the Constitution of the United States, is not here urged. Indeed, such contention is hardly open to the petitioner in view of the decision in Holden *v.* Hardy, 169 U. S. 366, where the Supreme Court of the United States decided that a statute of Utah, substantially identical in its main features with the one before us did not deprive persons affected by it of any right conferred by the Federal constitution. Conceding the binding force of that decision as an adjudication of all Federal questions involved, the petitioner here bases his claim to immunity from prosecution upon certain provisions of the constitution of this State. Before proceeding to a consideration of the particular points made in this connection, it may be well to briefly state the basis of the decision in Holden *v.* Hardy, since, in our opinion, the points there decided go far toward answering the main objections predicated upon the State constitution. The right on the part of the State to restrict the freedom of citizens to make contracts concerning their callings or occupations was there upheld with respect to the particular callings covered by the Utah statute, i. e., mining and working in smelting and reduction works, upon the ground that the restriction in question was a proper exercise of the police power for the preservation of the public health. "The right of contract," says the court, "is itself subject to certain limitations which the State may lawfully impose in the exercise of its public powers. While this power is inherent in all governments, it has doubtless been greatly expanded in its application during the past century, owing to an enormous increase in the number of occupations which are dangerous, or so far detrimental to the health of employees as to demand special precautions for their well being and protection, or the safety of adjacent property. While this court has held * * * * * that the police power cannot be put forward as an excuse for oppressive and unjust legislation, it may be lawfully resorted to for the purpose of preserving the public health, safety, or morals, or the abatement of public nuisances, and a large discretion is necessarily vested in the legislature to determine, not only what the interests of the public require, but what measures are necessary for the protection of such interests." Again, in the same opinion, it is said that "while the general experience of mankind may justify us in believing that men may engage in ordinary employments more than eight hours per day without injury to their health, it does not follow that labor for the same length of time is innocuous when carried on beneath the surface of the earth, where the operator is deprived of fresh air and sunlight, and is frequently subjected to foul atmosphere and a very high temperature, or to the influence of noxious gases, generated by the processes of refining or smelting." The right to limit the hours of labor generally was not involved in Holden *v.* Hardy. No such right was asserted. It was, however, decided that the particular occupations affected by the act possessed such elements of danger and risk to the employee that the legislature might reasonably conclude that in such occupations a restriction of the time of labor was necessary for the protection of those engaged in such labor.

The limitations of the doctrine are well illustrated by the subsequent decisions in Lochner *v.* New York, 198 U. S. 45, in which the court, reversing the decision of the Court of Appeals of New York in People *v.* Lochner, 177 N. Y. 145, declared invalid a law limiting the hours of labor of bakers. The real ground of that decision is, we think, to be found in the following extract from the opinion of Mr. Justice Peckham: "We think that there can be no fair doubt that the trade of a baker, in and of itself, is not an unhealthy one to that degree which would authorize the legislature to interfere with the right of labor, and with the right of free contract on the part of the individual, either as employer or employee." The decision of the Lochner case was by a bare majority of the court, but the majority itself recognized the correctness of the decision in Holden *v.* Hardy and distinguished that case upon the ground that the callings involved in the two statutes were essentially different.

It follows, from a comparison of these two decisions, that in determining whether an act limiting the hours of labor in any occupation is in violation of the provisions of the Federal Constitution, the primary consideration is whether or not the occupation possesses such characteristics of danger to the health of those engaged in it as to justify the legislature in concluding that the welfare of the community demands a restriction. And this brings us to the petitioner's contention that the act is violative of the provisions of the State Constitution respecting special legislation. It is contended that the act violates subdivision 2 of section 25 of article IV, in that it is a special law for the punishment of a crime or misdemeanor created by said act; that it violates subdivision 35 of said section, in that it is a special law passed in a case where a general law can be made applicable; that it violates section 21 of article I in that it grants to citizens or classes of citizens privileges or immunities which are not, upon the same terms, granted to all citizens; that it violates section 11 of article I as not being of uniform operation. These various specifications are in effect direct to the same point, namely, that the law arbitrarily selects for its operation a special class of persons. It is, of course, unnecessary at this date to cite any authorities in support of the proposition that a law is not special or lacking in uniformity merely because it does not apply to every person or subject within the State. "An act to be general in its scope need not include all classes of individuals in the State; it answers the constitutional requirements if it relates to and operates uniformly upon the whole

of any single class." (Abeel *v.* Clark, 84 Cal. 226.) The classification created for the purposes of legislation must, of course, be a reasonable one. The test of its propriety is well stated in City of Pasadena *v.* Stimson, 91 Cal. 238, where the court declared "that although a law is general and constitutional when it applies equally to all persons embraced in a class founded upon some natural or intrinsic or constitutional distinction, it is not general or constitutional if it confers particular privileges or imposes peculiar disabilities or burdensome conditions in the exercise of a common right upon a class of persons arbitrarily selected from the general body of those who stand in precisely the same relation to the subject of the law." But in view of the decision in Holden *v.* Hardy, based as it was upon the fact that the occupations covered by this act were so peculiarly dangerous as to justify special regulation, how can it be said that the legislature in selecting these occupations and applying to them provisions designed to protect the health of those engaged in them was making "a class of persons arbitrarily selected from the general body of those who stand in precisely the same relation to the subject of the law?" The very grounds which led the Supreme Court of the United States to hold that the Utah statute did not deprive any person of life, liberty, or property without due process of law, nor deny to any person the equal protection of the laws, requires the conclusion that the legislation was not special within the meaning of our State Constitution. (See Julien *v.* Model B. L. & I. Co., 116 Wis. 79.) For if it could be said that the limitation of the hours of labor of miners and those engaged in smelting and reduction works could not be supported by any natural or intrinsic distinction between these occupations and others the legislation would, for the reasons declared in Lochner *v.* New York, necessarily fall before the provisions of the Federal Constitution.

The appellant relies with great confidence upon the decision of the Supreme Court of Colorado, *in re* Morgan, 58 Pac. 1071. In that case it was held that an act similar to the one under consideration was unconstitutional, this conclusion being based upon the ground, among others, that the law was "class legislation." We have not had access to the constitution of Colorado, and are not informed of its precise terms regarding general and special legislation. It may be observed, however, that some of the grounds relied on by the Colorado court for its decision are clearly in conflict with the views of the Supreme Court of the United States in the Holden case. In other States, having constitutional provisions directed against the passing of special laws, legislation of this character has been upheld. (*Ex parte* Boyce, 27 Nev. 299; *ex parte* Kair, (Nev.) 80 Pac. 463; State *v.* Cantwell, 179 No. 245.)

It is argued by the appellant that the act is special because it does not include in its scope many occupations other than mining which are equally dangerous to the health of the persons engaged in them. Reference is made, for example, to marble cutters and marble drillers; diamond cutters; workers in furnaces and laundries; men employed in wine cellars, breweries, and ice houses; men in boiler works, match makers, cleaners of clothes, makers of white lead, of china and earthenware, and many others. The argument is, apparently, that any law is special which does not include all of these occupations. This view is obviously unsound. Whether these other occupations present the same dangers to health as those involved in mining, etc., and whether, if they do, these dangers can best be met by restricting the hours of labor, are primarily questions for the legislature. The legislature has determined one or both of them in the negative by enacting this law. The selection of the businesses requiring regulation is confided to the legislative discretion, and this discretion is not subject to judicial review unless it clearly appears to have been exercised arbitrarily and without any show of good reason. It certainly cannot be justly said to be apparent that each or any of the trades instanced by counsel is, in its effect upon the health of workers, identical with the occupations covered by the act under discussion, nor that the most appropriate method of counteracting any injurious effects pertaining to any of them is necessarily the same as that found to be suitable for miners and men working in smelting and reduction works. In other words, the law is not rendered special by the mere fact that it does not cover every subject which the legislature might conceivably have included in it. It is enough that the subjects covered possess such intrinsic peculiarities as to justify the legislative determination that those subjects require special enactment.

It may be questioned whether, in view of the title of the act, the limitation of hours applies to all underground work or only to that performed in mines. But if we assume, with petitioner, that only work in mines is covered, the act is not thereby rendered obnoxious to the constitutional provision against special legislation. This point was made in State *v.* Cantwell *supra*, and was met by the answer that the discrimination between work in mines and that in other underground diggings was justified by the fact that mining is a permanent business in which men are engaged steadily for long periods of time, whereas other underground diggings are ordinarily temporary and irregular in duration and for that reason do not require the same measure of regulation.

The act and the title thereof do not embrace more than one subject (Const., art. IV, sec. 24; *ex parte* Boyce *supra*). It is designed, as we have said, for the protection of the health of persons engaged in occupations regarded by the legislature as dangerous. Such occupations as in the legislative view were subject to the same kind of danger and which required the same kind of regulation could properly be joined together in one act. We may remark the inconsistency between the argument that the act is void because it covers different kinds of employment and petitioner's other contention that the act is void because it does not cover a greater number of employments.

Petitioner attacks the provisions of the act that the hours of employment shall be consecutive (excluding, however, any intermission of time for lunch or meals). We are not prepared to say that this limitation bears no reasonable relation to the protection of the health of the workmen. The legislature may have considered that persons working in underground mines, in smelters, or in reduction works required for their protection, not only that the total number of hours of employment in a day should be limited, but that the hours of labor should be so adjusted as to allow the employee a long consecutive period for rest and recreation. This is a question of legislative policy with which the courts have no concern. Upon the whole case, we are satisfied that the act is a valid exercise of the legislative power and that the petitioner is properly held. It is ordered that the writ be dismissed and the petitioner remanded to the custody of the constable.

Sloss, J. (concurring: Shaw, J., Angellotti, J., Lorigan, J., Melvin, J., Henshaw, J.)

IN THE MATTER OF THE APPLICATION OF FRED J. MARTIN FOR A WRIT OF *Habeas Corpus* (Crim. No. 1540).

The petitioner in this case was also petitioner in Criminal No. 1539, just decided, and is held under a complaint purporting to charge him with a violation of the terms of the act regulating the hours of employment in underground mines and in smelting and reduction works, approved March 10, 1909. The validity of the act as a whole was considered and upheld in the foregoing case. The present proceeding presents solely a question of construction. The petitioner is charged in the complaint with having required a miner to work eight full and consecutive hours at the face of a drift in a mine in addition to the time necessarily occupied in traversing the shaft, underground drifts, and tunnels, between the surface of the mine and the face of said drift. The time so occupied in going to and from the place of work was in excess of thirty minutes. We think the petitioner's contention that no violation of the act is here charged is correct and should be sustained. The act provides that the period of employment of persons employed or engaged in work in underground mines, etc., shall not exceed eight hours in any twenty-four hours. The purpose of the act is, as has been pointed out in the opinion in Crim. No. 1539, the protection of the health of men working in underground mines. The injury to health which

seems to have been apprehended is that which would be encountered by one subjected to the strain of performing manual labor under detrimental conditions. Giving to the words of the act their ordinary and reasonable meaning, the limitation of time is to be construed as referring to the time when men are actually engaged in work, not when they are going to or from their work. There is nothing in the language of the act which would justify a more ristricted interpretation.

A somewhat similar question has arisen under the Federal statnte (5 Fed. St. Ann. 819) providing that "if any letter carrier is employed a greater number of hours per day than eight he shall be paid extra for the same in proportion to the salary now fixed by law." The 'employment' which entitled a carrier to extra pay under this law is held to be an employment "in work that is not inconsistent with his general business under his employment as a letter carrier" (United States *v.* Post, 148 U. S. 124). It does not include short intervals, or 'swings', between trips, when the carrier is not actnally employed in work, and not required to remain in or abont the post office (United States *v.* Langston, 85 Fed. 613; United States *v.* McCrory, 119 Fed. 861).

The petitioner is discharged.

Sloss J. (concurring: Shaw, J., Angellotti, J., Lorigan, J., Melvin, J., Henshaw, J.)

IN THE MATTER OF THE APPLICATION OF FRED J. MARTIN FOR A WRIT OF *Habeas Corpus* (Crim. No. 1541).

This case was submitted upon the same briefs and at the same time as the two cases with the same title, numbered, respectively, 1539 and 1540. The only point wherein it differs from the other two cases is that in this case the petitioner was charged with having commanded a workman to work more than eight hours in one day, upon a mill in control of the petitioner and then in operation crushing and pulverizing quartz for the purpose of extracting precious metals therefrom, in other words, in an ordinary stamp-mill. The only arguments in favor of the writ, not answered in the opinions in the other two cases, are, first, that the mill in question is working free-milling ore and the metal is extracted solely by the process of pulverizing and washing, which, it is claimed, is not embraced within the phrase "smelters and other institutions for the reduction or refining of ores or metals," contained in the act, and, second, that the occupation of laboring in a quartz mill of this kind is hot sufficiently injurious to health to bring it within the scope of the police power. As applied to mining, the word 'reduce' means to bring to a specified form or condition, as, to reduce a rock to powder, or, to deprive an ore of non-metallic constituents, and the word 'reduction' means the separation of metals from their ores (Standard Dic.). The application of heat to flux the ore is not necessary in order to make the establishment an "institution for the reduction of ore." A quartz mill comes as clearly within the meaning of that phrase as a smelter. We cannot agree to the proposition that the insertion of the word 'smelters', at the beginning of the phrase used in the statute, brings it within the rule *noscitur a sociis*, so as to confine the application of the statute to institutions wherein ores are reduced by smelting.

The legislature has by this act declared that in its judgment the occupation of laboring in reduction works of this character is so dangerous to the health of those engaged in it as to make it a proper subject of regulation. As was remarked in the opinion in case No. 1539, *supra*, the legislative judgment upon a matter of fact such as this "is not subject to judicial review unless it clearly appears to have been exercised arbitrarily and without any show of good reason." In a quartz mill the ore is first crushed and then washed in order to separate the metal from the rock. In this process it is obvious that frequently the air in the vicinity of the crusher will become filled with fine particles of the rock in the form of dust, which the workmen in breathing must draw into their lungs. We cannot say that this will not be detrimental to their health to such an extent as to make it advisable to shorten the hours of labor therein. It has been so held in cases in other States, with respect to similar statutes. (*Ex parte* Boyce, 27 Nev. 33; 75 Pac. 3; *ex parte* Kair, 28 Nev. 141; 80 Pac. 465; State *v.* Holden, 14 Utah 98; Holden *v.* Hardy, 169 U. S. 396.). For these reasons we are of the opinion that the facts charged in the complaint against the petitioner state an offense defined in the statute, and that the statute is, in this particular, a constitutional enactment. The process upon which he is in custody is therefore valid. It is ordered that the petition be dismissed and that the petitioner be remanded to the custody of the officer.

Joplin District in 1909.

Figures compiled by Otto Ruhl show that the output from the mines surrounding Joplin in 1909 was the greatest in the history of the district, reaching a total of 301,205 tons of zinc ore valued at $12,192,770, and 44,186 tons of lead ore valued at $2,420,878. The total value was a trifle less than in 1907, the previous record year, owing to the low

price of the metals during the early part of 1909. For the first time the outputs of the calamine and blende ores are shown separately. The calamine approximates 10% of the blende in amount and averages $20.05 per ton, while the 'jack' brought an average of $42.21. The calamine sold on a basis of 40% zinc and the blende 60%. At the time of the panic a large amount of development had been completed, and a number of old mines reopened. In the latter part of 1909 the higher prices made possible the resumption of mining at these properties. The greatest increase over 1908 has been from the mines operating in the sheet-ground at Webb City, Duenweg, and Prosperity, while the zinc output from Carthage, Sarcoxie, and Miami was practically doubled, and the lead output of Miami trebled. Consistent drilling has extended the known fields both in Missouri and Kansas and opened payable ore in a number of properties at greater depth. One of the most significant features of recent development has been the discovery of payable ore below the Grand Falls chert at Cave Springs, Empire, and elsewhere. During the earlier part of the year the price of blende varied between $35 and $42 per ton, but in the latter half rose to as high as $52 for standard 60% grades, the price for lead ore ranging between $50 and $60 per ton. The following table shows the output in pounds and amount paid for lead and zinc ore by camps.

Camp.	Blende		Calamine		Lead		Total value.

Commercial Paragraphs.

The Broderick & Bascom Rope Co., St. Louis, Missouri, has received an award of a gold medal for its Yellow Strand wire rope from the directors of the Alaska-Yukon-Pacific Exposition.

The Wood Drill Works, Paterson, New Jersey, is distributing Circular No. 60, giving a description of the test applied to Wood rock-drills, and the opinions of A. C. Dart, of the University of Wyoming, and J. M. Carson, Jr., of the West Point Military Academy, as to work accomplished with the Wood rock-drills.

John Wellington Nesmith, president of the Colorado Iron Works Co., died December 17, 1909. Mr. Nesmith had been identified with the progress of the West from the early days, coming to Colorado in 1860, engaging in mining and milling in Gilpin county. He subsequently became interested in Langford & Co.'s foundry, the nucleus of the Colorado Iron Works, of which he became manager in 1879 and president in 1886. In the advancement in ore-treatment methods he took an active interest, and specialized in the blast-furnace smelting of lead and copper ores.

Catalogues Received.

The San Francisco office of the Allis-Chalmers Co. has been moved to the Jackson Bdg., 160 Second street. It is in charge of R. B. Elder.

The Dings Electro Magnetic Separator Co., Milwaukee, Wisconsin. Bulletin No. 21. 'Magnetic Separators'. 20 pages. Illustrated. 6 by 9 inches.

Guy M. Vail, formerly with the A. S. & R. Co., Denver, and Braden Copper Co., in Chile, has become the partner of W. C. Stewart in assaying and ore-testing, at Portland, Oregon.

The American Well Works, Aurora, Ill. 'Report on the Results of Certain Efficiency Tests of American Centrifugal Pumps.' By Arthur L. Adams. 16 pages. Illustrated. 6 by 9 inches.

The Fred M. Prescott Steam Pump Co., Milwaukee, Wisconsin, has recently opened a district sales office at 617 Newhouse Bdg., Salt Lake City, Utah. It will be in charge of R. E. Burke.

The firm of Trippe, Thompson & Co., expired by limitation, December 31, being succeeded by Thompson, Towle & Co. and Trippe & Co. The address of both firms is 25 Broad street, New York City.

The A. Lietz Co. San Francisco Solar Ephemeris for 1910. A convenient pocket manual for those having solar observations to make. It also contains a table of the azimuths of Polaris. Sent free on request. 10 pages. 3¼ by 5½ inches.

The Risdon Iron Works, 272 Steuart street, San Francisco, California. Catalogue No. 17. Seventh Edition. 'Gold Dredging Machinery.' The latest description of this well known type of dredge. 53 pages. Illustrated. 6½ by 10 in. It may be mentioned that the Risdon Iron Works now has five dredges under construction in its works.

The F. Mayer Boot & Shoe Co., of Milwaukee, Wisconsin, reports that the past year has been a prosperous one for it and that its sales of the Mayer line of miners' and prospectors' boots have increased steadily. The Washington Shoe Mfg. Co., Seattle, Washington, is acting as the Western branch of this company.

EDITORIAL.

QUICKSILVER, in 1909, faced a somewhat unexpected increased demand. California producers in general were not in position to profit from the increased price reached in the latter part of the year, but at least one considerable sale at $51 per flask was recorded, and the prospect for still better prices is strong. In Texas the industry thrived, and in Nevada, as recorded in our issue of November 13, production has begun.

OIL PRICES are on the ascendant. Contracts have been entered into by the Producers' Agency at $1.62½ per barrel. It is the opinion of those well informed in the business that the demand for California oil in 1910 could only be met by a production of 65 million barrels. Evidently the rosiest days for the oil producers are still ahead of them, and the search for petroleum will offer constantly increasing opportunities for the use of large amounts of capital.

TELEGRAPHIC code-messages are permissible under the modified ruling of the telegraph companies when the code-words are words found in the dictionaries of the English and the Germanic and Romance groups of languages. The permitted list of code-words also embraces the official vocabulary adopted at a convention of the telegraph and cable companies of the world, held a few years ago at Berne, Switzerland. This list embraces the words found in practically all the old standard telegraphic codes, such as the Bedford McNeill, Lieber, and others. Artificial code-words not found in the vocabulary or regular dictionaries are charged for at the rate of five letters to a word.

PRACTICAL rough and ready methods are always worthy of description. American progress has been in no small measure a result of that so-called Yankee ingenuity which is readiness of wit to play Crusoe and find a way to do things well with the facilities at hand. In our last issue we printed an account of a home-made grinding pan devised by Mr. William H. Washburn. It is in reality a modified Berdan pan, though Mr. Washburn has clearly not derived his idea from this Australian prototype. We note his suggestion that trituration by ball-grinding is less likely to produce flouring of mercury than the attrition of a muller, which is worthy of consideration.

LOCAL OFFICES of the United States Geological Survey are maintained in Denver, Salt Lake, and a number of other Western cities. In California the Topographic branch has headquarters at Sacramento, the Water Resources branch at Pasadena,

and the Mineral Resources branch at San Francisco. Mr. Charles G. Yale is the local representative, and has an office in the Appraisers' Building. On January 1, Mr. Yale was given substantial promotion, and it is proposed to make his office in name, as it has long been in fact, a general bureau of information regarding Geological Survey work in the Western States. This is a good move. The Survey will gain greatly by maintaining in the leading centres of mining activity, offices where accurate information regarding its work is at hand, and where visiting engineers and others can come into direct contact with responsible Survey officers. Mr. Yale is peculiarly qualified by training, experience, and wide acquaintance to fill such a position, and our congratulations go quite as much to the Survey as to him.

CONFIRMATION of the purchase of the Santa Gertrúdis mines at Pachuca, Mexico, by The Camp Bird, Ltd., has been received. The transaction would have been completed many weeks sooner but for the opposition by minority stockholders of the Mexican company who were averse to selling. Thus it comes as a cheering new year's promise of the continued influx of foreign capital into Mexico during 1910. The Camp Bird company has increased its capital stock to £1,350,000 by the creation of 250,000 additional shares of £1 each in order to provide funds for the exercise of option to acquire the Mexican mine. Accordingly, this move represents a policy of expansion, instead of an investment of a reserve fund. The treasury reserve stock of the Camp Bird is 280,000 shares. The new stock brings this up to 530,000, which it is said will be offered to present stockholders at five shillings above par. A large extra dividend is expected out of accumulated surplus before the subsidiary company to control the Santa Gertrúdis mine is launched.

Mining Engineers in 1909 and 1910.

For mining engineers the year just past has not been bad, but 1910 will be better. The chastening influence of the financial crisis has given a healthier tone to the mining world. It has shown the value of wise prevision and capable management. It has dignified more than ever the services of the trained technologist. Despite the cautious spirit of the business world, groping its way back out of the mazes of tangled commercial relations, the year now ended stands conspicuous for the greatest production of metals ever known in the history of the world. Moreover, this enormous contribution of iron, copper, lead, and zinc has been absorbed almost completely by the demands of trade. No one troubles himself longer about a copper or spelter surplus. Known metal stocks amount to no more than a convenient reserve supply. Preparation for increasing production of the metals has been made throughout the year upon a scale of unprecedented magnitude. Mines of copper, gold, lead, and zinc have been opened and developed, proving tonnages which, in many cases, insure successful operations for decades. Noteworthy and cheering to professional pride is the fact that this progress has taken place under the trained guidance of engineers to an extent previously unknown. The public lends a willing ear to the underwriter only on certificates of assets known and demonstrated by mining engineers and economic geologists of established reputation. The growing demand for the latter class of technologist is a splendid tribute, first of all to the confidence in the practical utility of geology as proved by the contributions of the United States Geological Survey, and by the able guidance which geologists have given to the leading mining enterprises of the country in preventing wasteful search for ores. It is significant that the staff of but few of the large mining corporations is now deemed complete unless it include one or more such men. The future of the professional man in mining is growing brighter.

Mr. Pinchot's Dismissal.

The President has taken a bold step, and one which we believe to be unfortunate. He has separated from the public service one of whom he earlier said, "his loss would be almost irreparable to the Government," and the public is unable to understand what justifies the action. The charge of insubordination is not taken seriously. It is true that Mr. Pinchot, in communicating directly with Mr. Dolliver, violated a rule laid down by Mr. Taft, but the rule itself is widely held to be illegal and, in practice, Senators and Representatives have always been free to obtain information from the Department without resorting to the highly technical method of formal application to the Secretary in charge. However, granted that a rule was broken, and even that the rule was a proper and legal one, Mr. Pinchot's real offense lies in his refusal to accept as final the President's 'vindication', of Mr. R. A. Ballinger. In this he seems to be no more guilty than the great majority of the American people, and we would point out that a good many years ago it was determined to be impossible to indict a whole nation. It is just this fact, that the public will evidently not accept at its face value a maturely expressed judgment of the President, which is the most striking feature of the case. It is true, despite a widespread and unshaken belief in his integrity and good purposes. For this Mr. Taft has only himself to thank. After having repeatedly and emphatically promised a 'revision downward' he not only signed the Payne-Aldrich tariff bill, but has gone out on the stump to defend it. There is a widespread and deep-seated conviction that the bill was not an honest one, that it did not revise downward, that it was formulated in the interests of the few rather than the many. All this is supported by the further fact that the cost of living has gone up rather than down. So the President, who went into the office with almost universal good will, has lost so much of public confidence as is involved in the general demand for evidence rather than decrees.

The so-called Pinchot-Ballinger controversy has been frequently noted in these columns. We have no desire at this time to enter into the merits of the case. Our concern is with the result in its bearing on the public land laws, particularly the mineral land laws. Our conviction that the latter are archaic and in need of complete revision has been frequently stated.

We furthermore believe that in this revision not only must changed business methods be taken into account, but adequate provision should be made for the conservation of those resources which are vital to our future, those which are akin to public utilities. For this doctrine Mr. Gifford Pinchot has been the foremost champion. Young, rich, and able, he has devoted his services with rare zeal and fidelity, to public service of the highest type. In his administration of the Forest Service he has at times and in places aroused a storm of protest. The MINING AND SCIENTIFIC PRESS has not hesitated to criticise him, as have others, but he has a strong and deserved hold upon the people of the West as well as the East, and his essential disinterestedness is not seriously questioned. Mr. Ballinger is not so fortunate. Justly or unjustly, he is widely distrusted, though opinion in the matter is by no means unanimous. His recommendations for new legislation in the interest of conservation are excellent, and there is good cause for congratulation in the fact that one result of the focusing of public attention on the matter is quite certain to be the enactment of some of this legislation. The unfortunate aspect of the case is that the present situation throws Mr. Taft into alliance with Mr. Cannon and Mr. Aldrich, and he is dependent upon them for whatever may be achieved. Remembering the tariff and a long series of previous bills, the people are undeniably distrustful, and whether he be concealed in the woodpile or stalking in the jungle, the shadow of the African broods over the scene.

The defeat of the House organization in its attempt to give to Mr. Cannon the naming of members of the committee to investigate the Department of the Interior and the Forest Service, is an extremely significant sign of this popular distrust. The standpat element of the Republicans must walk circumspectly beyond compare or they will surely lose control, and it seems here as ever, that whom the Gods would destroy they first make mad.

Goldfield Consolidated.

America can now boast of possessing the premier gold mine of the world, thus wresting first place from the Transvaal. The Robinson mine had for some years distanced all others, reaching an annual output of approximately $4,500,000. The Goldfield Consolidated Mines Company reports a production from its properties in Goldfield, Nevada, of $6,832,652 in its last fiscal year. This splendid showing was the result of milling 194,479 tons of ore. The net profits were $5,026,619, out of which dividends amounting to $5,000,000 were paid, being at the rate of $1.40 per share. The management has been beyond criticism, both in its technical and business aspects. This has been due to the high attainments of Mr. J. H. Mackenzie. Beginning with the pioneer work of Mr. J. W. Finch during the period while the properties were being selected and brought together, progress has been steady until now, when these mines have been finally placed on a solid basis for future success, working out many difficult problems in economical mining and milling. The construction of the new Consolidated mill was an achievement of which engineers might be proud, and Mr. Mackenzie, Mr. A. H. Howe, and the others concerned may take honor in the record it is making. It is the most notable structure for gold milling in America, and represents a plant of the highest type of efficiency in accord with modern practice, complete in its details from the very beginning. Perhaps no other great plant in America dealing with the precious metals is freer from the disadvantages of partial reconstruction, a point of importance in economical operation. System and close attention to detail have been responsible for reducing the total cost to $6.77 per ton. In view of the high costs of supplies and labor, the irregularity of the deposits, and of the further fact that this figure includes fixed charges, such a result is remarkable. The items of labor and supplies made up $940,836 out of a total of $1,200,071. The milling costs were $1.951 per ton, and the extraction reached 94.49%. This again is a remarkable achievement, when it is remembered that the average assay value of the ore sent to mill was $33.45. A full analysis of the year's work will appear in our issue for next week. We may remark here that Mr. Mackenzie announces the perfection of an economical method of refining on the spot which will enable the company in future to ship bullion 990 fine. The activity in development is worthy of commendation, nearly twenty-five per cent of the entire operating cost being on that account. The result is that the year closes with over 800,000 tons of ore reserves developed, representing about four years' supply, which gives a safe margin. We have frequently urged that a well conducted mine should at least keep its development three years ahead of mill-needs. This allows a safe margin in case of unforeseen contingencies.

The production has been increased since the annual report was issued, the amount of ore milled in November having been 19,285 tons, averaging $37.57 per ton. Additional equipment for increasing the capacity of the mill has arrived, so that the current year will witness a still larger output of bullion. For several years to come the Goldfield Consolidated will manifestly hold its place securely as the greatest gold mine in the world. The speculating public will accordingly watch the fruits of development with keen interest. In the price of the stock the future possibilities have been discounted heavily. This is a matter which admits of mention, not of criticism. The market value of anything is what people are willing to pay for it. Intrinsic value is different. In the case of the Goldfield Consolidated the policy of publicity has been frankly adopted. Anyone who buys on the strength of supposedly 'inside information' is proceeding from premises which are evidently not justifiable. We believe the public is informed of the situation fully by the monthly statements, and such new development as can take place within any single month is insufficient to warrant an appreciable change in the price-level of shares. We have already extended our congratulations to Mr. J. R. Finlay upon his accession to the management. His capability, resourcefulness, and high character are a guarantee of faithful and efficient discharge of the large responsibilities which he has assumed.

NEW CONCENTRATOR OF THE BUNKER HILL & SULLIVAN.

Written for the MINING AND SCIENTIFIC PRESS
By GELASIO CAETANI.

The new concentrator of the Bunker Hill & Sullivan Mining & Concentrating Co. was completed and put in operation on December 8 last. The design of this plant has been the result of a thorough metallurgical investigation carried on during the past three years, and though it does not differ essentially from the other lead-silver mills of the Coeur d'Alene, it contains many features which are novel. The plant is divided into three main departments which are mechanically independent of each other. They are (1) the crushing plant, (2) the coarse concentrating department, and (3) the slime plant.

The ore consists of silver-bearing galena, siderite, and quartzite. The siderite is the predominating mineral, and represents from 40 to 45% of the ore. The galena is a metasomatic replacement of the siderite, and as this replacement has seldom been complete, the galena and siderite are intimately intermingled, the galena being often minutely disseminated through the iron carbonate. The ore assays from 12 to 13% lead, and contains about 0.42 oz. silver per unit of lead.

Electric motors haul the ore from the mine in trains of 15 cars, each of 3½ tons capacity, and dump it into the 'rock-house' bins, which hold about 1400 tons. From these bins it is fed by chutes to a slow-traveling 42-in. belt-conveyor that dumps it on an inclined grizzly with 1¼-in. clearance intervals. The oversize goes to a No. 5 Kennedy gyratory crusher, set to about 1½-in. maximum aperture, while the undersize is fed to a 24-in. Jeffrey belt-conveyor, and acts as a bed on which is discharged the ore from the crusher. This conveyor elevates the ore at an angle of 20° to three 30-mm. trommels, 4 ft. diam. and 7½ ft. long. The screening is discharged to another 24-in. conveyor, while the oversize goes to a set of 14 by 36-in. rolls. A bucket elevator raises the re-crushed product to a 30-mm. trommel, the oversize of which is returned to the rolls with the ore from the gyratory crusher. All the ore which has been screened through 30 mm. passes through the sampler before being elevated to the mill storage-bins, where it is distributed by a Jeffrey self-moving tripper.

Coarse-Concentrating Plant.—The mill storage-bins rest directly on the ground, and the ore is fed by five Challenge feeders to a 24-in. belt-conveyor which elevates it to the mill. This arrangement was copied from the old Dominion mill at Globe, Arizona, the only difference being that the feeders are operated by an 8-speed induction motor, controlled from the jig-floor. The feeders revolve about twice per minute, and the amount of feed is regulated by varying their speed. With the baffle-plate half open, two feeders are sufficient to deliver 550 tons, which is the rated capacity of the mill. This feeding arrangement is the most perfect I have seen for comparatively dry ores. The belt conveyor elevates the ore at an angle of 20°, and at a speed of 275 ft. per minute to the top of the mill, about 80 ft. from the ground. As the ore is dumped it passes in a thin stream under a 12-in. Browning magnet, which catches the spikes, nails, and other pieces of iron that would be the cause of trouble in the mill. Two 10-mm. trommels then divide the feed into two products, (1) that between 30 and 10 mm., which goes to the bull-jigs, and (2) the 10 mm. and finer which goes directly to the classifying jigs.

The jigs are of the Harz type, but are of a special design evolved in the Bunker Hill plant, the result of an extensive series of experiments. The bull-jigs have four, and the classifying jigs five compartments. Such a number of compartments is called for by the necessity of making five different products on the coarse jigs and nine on the classifying jigs.

The bull-jigs separate the following products: (1) first-cup concentrate, assaying from 50 to 55% Pb,

Map of Idaho

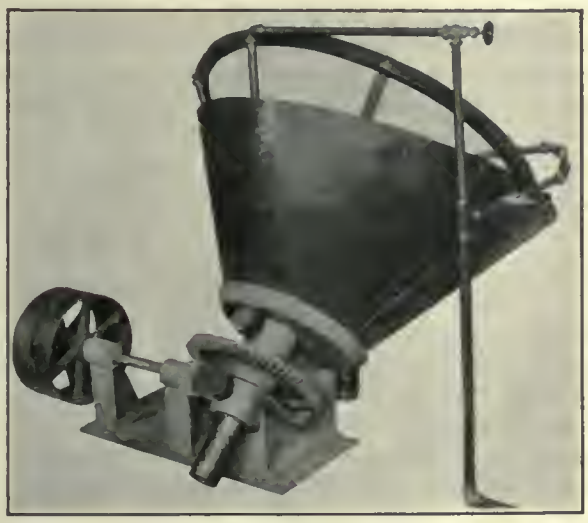
shipped directly to the smelter; (2) second-cup concentrate, assaying from 35 to 40% Pb. This could be shipped direct, but owing to the high freight and treatment charges it is more profitable to grind this concentrate in Huntington mills, and to raise its grade by eliminating a large part of the iron carbonate gangue on Card tables. The tailing from the 'grading' tables assays from 5 to 8% Pb. The galena is so finely disseminated in this tailing that further grinding and concentration is not profitable. The elimination of this high-grade tailing involves a considerable loss, but the high-grade concentrate obtained increases the market-value to such a degree as to more than compensate for the tailing losses. (3) The third and fourth-cup discharges are middling, which is crushed by rolls to 10-mm. size, and is rejigged on two classifying jigs that work exclusively on middling. This arrangement eliminates all the disadvantages caused by returning the crushed middling to the original feed. The character, tonnage,

and assays of the coarse-jig middling can be observed at any moment on the middling jigs. The tailing from these jigs is higher in grade than that from the other jigs, as it represents that part of the middling in which the galena is so finely disseminated through the siderite that further handling is not profitable. (4) Hutch product, returned to the middling jigs. (5) Tailing, assaying from 1 to 1.6 Pb.*

The classifying jigs separate the feed into nine

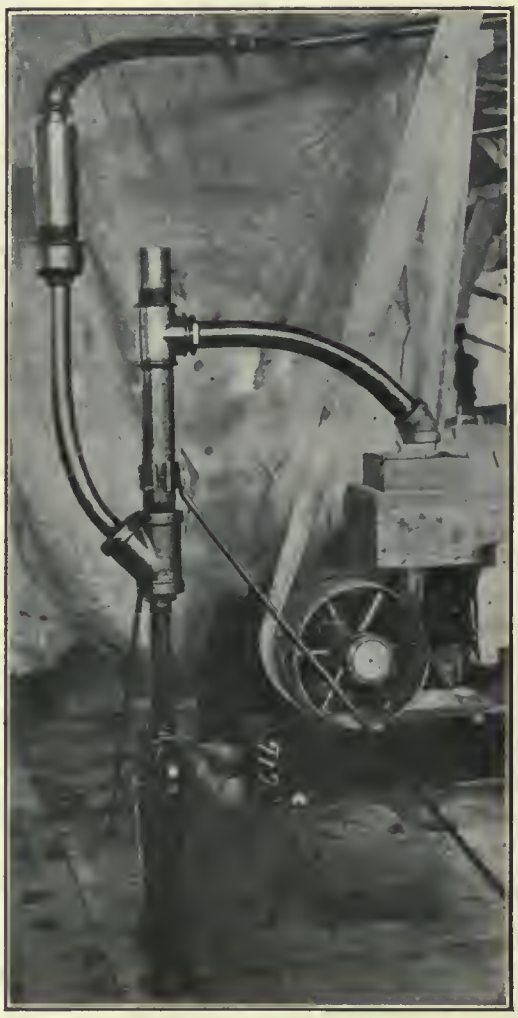
Bunker Hill & Sullivan New Mill.

products. (1) Slime. The first compartment of the jig is provided with two transverse dams dipping into the ore-bed. The current of water pulsating through the jig-bed throws the slime to the surface, and effectively discharges the whole of it through two lateral openings. The slime then passes through a curved stationary screen (which separates all wood-pulp) to a spitzkasten, the sand discharge from which is piped to the No. 2 elevator. The overflow carries no particles coarser than 200-mesh, and is led



Bunker Hill Screen.

to settling tanks, whence it is fed to 28 Frue vanners. (2) First-cup concentrate, assaying from 60 to 65% Pb, shipped to the smelter. (3) Second-cup concentrate, assaying 40%, sent to the grading department, as explained for the similar product from the bull-jigs. (4) Third and fourth cups discharge a middling assaying about 10% lead and 30% iron. This is either shipped as lead-iron ore, or is treated together with the fifth product. (5) The fifth cup discharges middling assaying from 3 to 5% Pb, which is crushed by rolls and goes to the No. 2 elevator. (6) The hutches of the third, fourth, and fifth compartments that have passed through the 3-mm. jig-sieves go to the sand-rolls, and then to the same elevator as the fifth product. (7) The hutch of the first compartment, assaying about 50% Pb (and which has passed through a 2-mm. sieve) flows to the sand-plant, where it is passed through a hydraulic (pipe) classifier, which divides it into two products, (1) a coarse spigot-discharge, assaying from 76 to 77% Pb, and (2) an overflow which is fed directly to a Card concentrator. This concentrator eliminates as middling that fine sand contained in the hutch which is bound to occur, as the



Pipe Classifier.

jig-feed is unsized. These classifiers are built out of pipe-fittings, there being one classifier for each table. The high efficiency of these simple contrivances is due to the fact that the coarse particles of the hutch are high-grade cubes of galena, while the finer particles are low grade. (8) The hutch of the second compartment assays from 25 to 30% lead, and is treated in the same way as the first hutch-discharge. The spigot-discharge of the pipe-classifiers assays from 55 to 60% Pb. (9) Tailing, assaying about 1.3% Pb. Summing up, it is seen that all the mill-feed passes over the two sets of jigs described above, and, from these, four kinds of products flow to the sand-plant. These products are: (1) low-grade concentrate to the grading department; (2) crushed middling, hutch-products, and sand, to the No. 2 elevator; (3) first and second

*All assays of lead are wet assays.

hutches to the pipe-classifiers; (4) slime to settling tanks.

Sand-Plant.—The second of these products is raised by the No. 2 elevator to a 2-mm. trommel, the oversize of which is ground through 20-mesh screens by 6-ft. Huntington mills. The sand from the Huntington mills joins the undersize from the trommel, and is elevated to the No. 3 elevator to four 22-mesh Bunker Hill revolving screens. These screens, invented by L. Warner, the foreman of the new mill, have successfully taken the place of other fine-screening machines previously used. They are conical trommels, with their axes set at 45°. The angle at the vertex is about 80°, and they revolve at a speed of 20 rev. per min. The pulp is fed across the descending surface of the screen, and the oversize clings by centrifugal force to the ascending portion of the screen until it is raised to a certain height, when, partly by gravity, and partly by the action of a spray, it falls directly into the vertex of the cone, and is discharged through the hollow shaft of the machine. As the screens undergo no bending, and have no tendency to crack, they are made of steel-wire cloth, and last about six weeks. One machine will handle from 50 to 80 tons of feed that has passed through a 2-mm. screen. The illustration shows one of these Bunker Hill screens as built by Hendrie & Bolthoff.

The oversize from the screen is sent to a Huntington mill to be ground to a size slightly smaller than the mesh-opening of the Bunker Hill screen. In short, all the material elevated by the No. 2 elevator is passed through 22-mesh, 0.6-mm. opening, and is then fed to three 'duplex' classifiers. These classifiers, evolved in the Bunker Hill mills, are of the spitzlutten type, and have the advantage of being compact, economical in water, and perfectly foolproof. They yield three products, and an overflow, which latter is separated by conical slime-classifiers into fine sand and slime. These slime-classifiers consist of two cones. The first one is similar to a small Callow tank, and the second is suspended within the first. The angle of the inner cone is such that the area of the annular space between the two cones is about constant from bottom to top. Spitzlutten action, or the principle of classifying through channels of constant area, is consistently observed at each stage of classification.

The slime from the cone-classifiers is thickened in settling tanks together with the slime from the jigs and the slimy head-waters of the Card concentrators. The four products of the classifying system are sent to four sets of Card concentrators. They are distributed to these tables by pocket launders which effect a marked classification on the already classified products. The result of this two-stage classification is that each table has a differently classified feed. The Card concentrators have proved to be the most efficient machines for this kind of ore. They yield five products, as follows: (1) First-class concentrate assaying 76% Pb. (2) Second-class concentrate, assaying about 45% Pb, which is re-concentrated on a grading table with a view to making more 75% product, and to separate any sand which may accidentally have been thrown into the second-class. (3) Middling which is re-concentrated on special middling tables, or is returned to a 40-mesh Huntington mill. (4) Tailing, assaying about 2.5% lead. This comparatively high assay of tailing is due to the fact that the feed consists exclusively of crushed middling, and that owing to the character of this middling it would be necessary to grind it to less than 100-mesh if it were aimed to reduce the assay to 1% lead. This is not economically possible. (5) Slime to settling tanks and vanners.

Summing up, the general arrangement of the mill is mechanically simple and metallurgically complex. The ore moves rapidly through the mill, and none of the products is returned to the machines that produced it. The mill is very sensitive, in that any variation in tonnage or grade, or any faulty operation of any machine, is immediately shown on the next following machine. Another important feature of the design is that all the products of a machine are re-handled on other machines, thereby correcting any faulty operation of the first. The main object of the mill is to produce lead with the highest possible economical, not metallurgical, efficiency. Where the lead cannot be saved with profit it is allowed to run to waste; and where the market value of a concentrate can be raised, it is re-treated until there is nothing left to improve.

This mill represents the results of three years experimental work, and though it has not been in operation over a month it has been working smoothly and has answered perfectly in every detail.

Dimension-books which give the size of the largest object that will pass through the smallest tunnel, bridge, or opening on the road, are issued by many railroads. The data are important to firms that manufacture large objects. Where the weight does not prohibit, parts of structures are put together in the shops in as large portions as possible, the limiting feature being the possibility of shipping. In many cases it has been necessary to ship large pieces by round-about routes on account of the old-time small tunnels or light bridges on the direct route. These dimension-books give, first, the dimensions governing the size of the object that can be shipped over the entire system of the railroad, and second, those of each division. As soon as the smallest of these openings is re-built and enlarged a new dimension-book is issued. These data are tabulated in three columns. In the first is given 'height above top of rail'; in the second, the corresponding 'width of lading on open cars must not exceed'; and in the third, the location of this point on the railroad.

Cadmium yellow, a brilliant yellow pigment, is cadmium sulphide. It forms one of the most permanent colors obtainable for artists. This pigment is used also by some railways and street-car companies as a protective covering for other less permanent yellows that are employed in painting their cars and coaches. Yellow paints that are darkened by the sulphide gases in coal smoke or that fade under the action of sunlight are in this way kept brilliant by a semi-transparent coat of cadmium yellow.

COARSE CRUSHING AT THE BOSTON CON. MILL AT GARFIELD, UTAH.

Written for the MINING AND SCIENTIFIC PRESS
By L. S. AUSTIN.

The mill of the Boston Consolidated Mining Co., is situated at Garfield, Utah, 27 miles from the Bingham mines of the company. An extended description of the mill is given in *Mines & Minerals* for May, 1908, but the coarse-crushing plant merits special attention as indicating how cheaply the ore can be handled and crushed. Fig. 1 is a view of the mill. The present article is confined to a description of the building attached in the rear for the storage and crushing of the run-of-mine ore. This building is approached by a double track on a trestle, and this trestle is extended beyond the building to enable the handling of the ore-trains. There are two parts, the ore-storage or crude-ore bin, 300 ft. long, and the coarse-crushing mill at the right. From the latter building a conveying-belt carries the coarsely crushed material to the ore-bins above the stamps in the large main building. Fig. 2 is a plan of the ore-storage bin and coarse-crushing plant; Fig. 3, a transverse section of the ore-storage bin; and Fig. 4, a section of the coarse-crushing mill.

Fig. 1. Boston Consolidated Mill.

The receiving ore-bin is 300 ft. long, 32 ft. wide, and 22 ft. high to the tracks, and is set 12 ft. 6 in. above the ground. It has a capacity of some 10,000 tons. The ore is brought from the bins at Bingham in 50-ton drop-bottom cars, in trains usually of 30 cars each. The two tracks are set at 17-ft. centres and the contents of the cars are dropped into the bin below. The flat bottom and the sides of the bin are of two thicknesses of 2-in. plank. There are 40 discharge-openings in two rows, set at 15-ft. centres, 24 in. square at the narrowest point. The ore drops upon an endless-chain conveying apron 3 ft. wide and 4 ft. 6 in. centres. Opposite each gate in the side of the bin is an opening 4 ft. wide by 4 ft. 6 in. high, having 12-in. channel-beams set as slats to close it, so that the ore can be poked down when it lodges in the discharge-opening. To get convenient access to the openings a gallery or walk is built at the proper height on each side of the bin. The apron delivers to two 30-in. 'Scandinavian canvas' conveying belts running longitudinally beneath the bins to the crushers. The steel apron-belts are driven by three rope-drives from the main driving-shaft in the crusher building. Each rope drives a shaft which communicates its motion by worm-gear to two of the six short shafts operating, as shown in the plan, by pawl and ratchet wheel, the apron-belts moving them about 4 in. at each revolution of the short shaft. The other four shafts are driven by belts from the centre shaft. Several of the aprons are feeding to the conveying belt at once, their united feed not only being enough for the crusher, but furnishing an average mixture of the ore. The ore as it drops from the steel apron is deflected by a steel chute (not shown in Fig. 3), sloping at an angle of 30° and pointing in the direction of travel of the conveyor. Any feed-apron can be stopped independently by throwing its pawl back and out of action. At the end of the bin the 30-in. conveying-belts rise 14 ft., at an angle of 19°, discharging over grizzlies, sloping at an angle of 35° to a No. 6 Gates crusher.

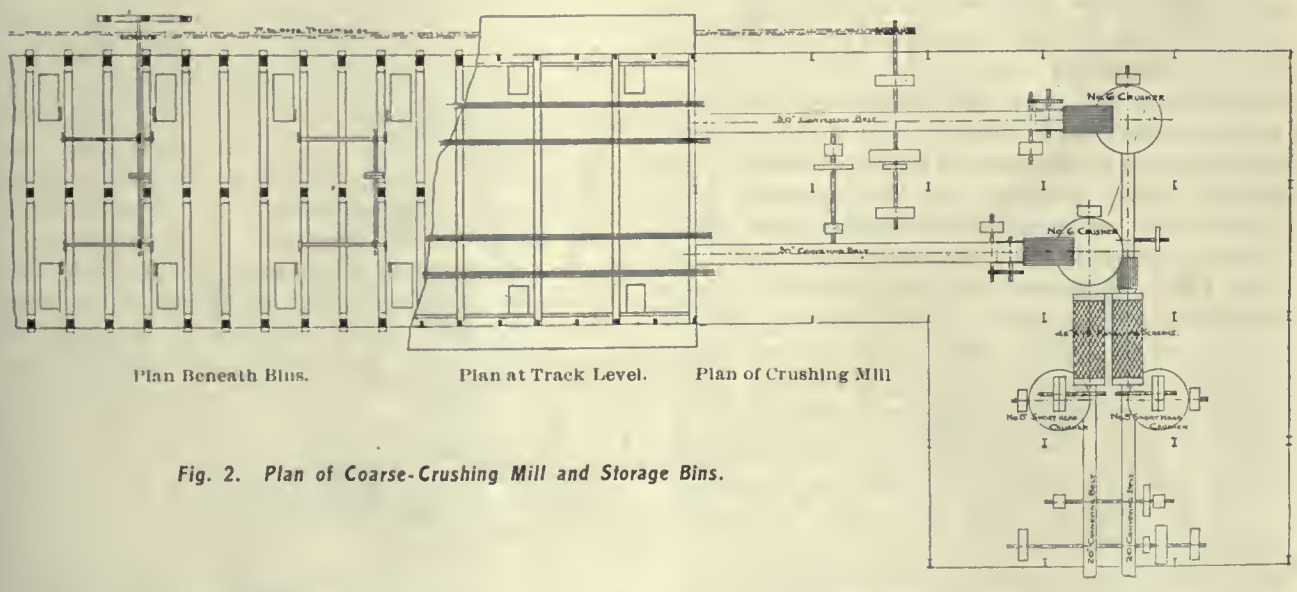


Fig. 2. Plan of Coarse-Crushing Mill and Storage Bins.

The coarse-crushing mill is divided into two in-

dependently operated units, each of 1500 tons daily capacity. As seen in plan in Fig. 2, and in elevation in Fig. 4, the undersize from each grizzly joins the

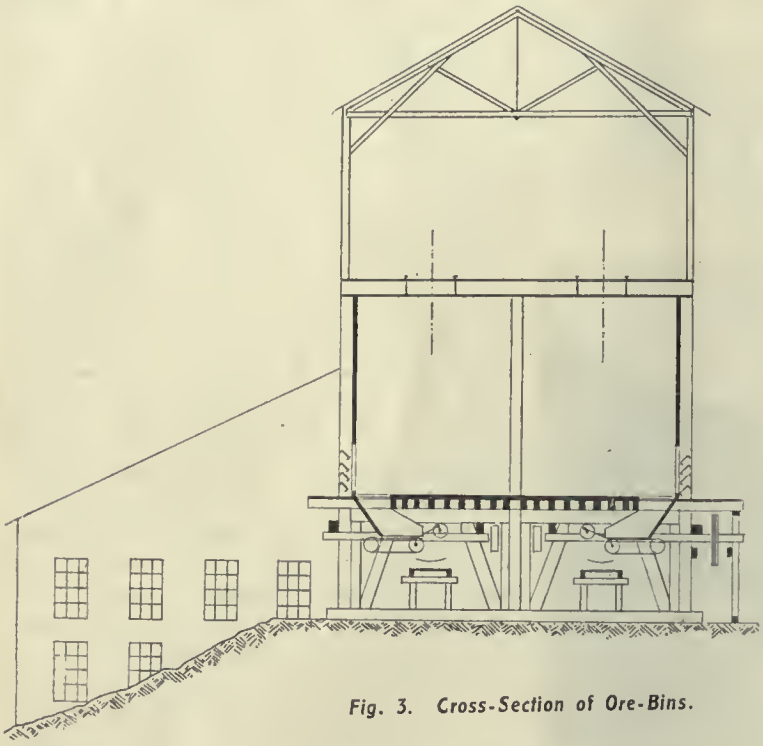

Fig. 3. Cross-Section of Ore-Bins.

crushed product of the crusher as a feed to a trommel 4 ft. diam. by 10 ft. long, having a screen of 1.25 in. round holes. The oversize of the trommel drops to a No. 5 short-head Gates crusher, and later joins the undersize upon a 20-in. belt-conveyor, rising at an angle of 23° to deliver to the 18-in. troughed conveyors, which run the length of the feed-bins of the stamps in the main mill. These 18-in. conveying-belts are provided with automatic trippers for filling the feed-bins at any point.

Referring again to the coarse-crushing mill, it is seen that in order to raise the product from the more distant of the No. 6 Gates crushers to its trommel, a 20-in. troughed belt-conveyor is employed, but its discharge goes over a grizzly before entering the trommel. It will be noticed that the ends of the ore-chutes, which guide the ore to the conveying-belt and bins, is made rectangular, so that these may fill with ore, thus protecting those places against the impact of the falling ore. The hoppers of the crushers are kept full of ore, so that no hand-feeding is needed. A 150-hp. electric motor drives the feed-aprons, the conveying-belts beneath the bin, and both No. 6 gyratory crushers, while one 75-hp. motor runs the trommels and the No. 5 short-head crushers. These motors are three-phase alternating, operating at 440 volts.

Summarizing the good points of this plant, I find (1) The ore is mixed when fed to the crushers. (2) Attendance is needed only to regulate the feed and to adjust and oil the machinery. (3) The ore itself is used to form its own slope, and protects the bottom of the bin from wear. The ore can be conveniently reached to poke it down. (4) The conveying-belts used are certain in action, durable, and simple. (5) The grizzlies relieve the crushers from the fine ore; the trommels insure a uniform coarse-crushed product.

The waning natural gas supply in some fields brings up the question as to the future of the business. The outlook is in some ways discouraging. Nevertheless, according to F. G. Clapp, the indications are that new wells and new fields will continue to be found and to be productive for many years. During the past year there has been improvement and increase in the business and in the area of the productive fields in Pennsylvania and West Virginia. That the companies are not discouraged is evinced by the fact that during 1909 the mains of the principal producers have been greatly extended. Cincinnati is now supplied, with every prospect that in another year Baltimore, Altoona, and possibly Washington, will have natural gas mains. Most of the shallow sand-fields exhausted years ago have been recently replaced by adjacent new fields in deeper sands. In all cases yet examined by Mr. Clapp, these fields bear a constant relation geologically to each other and to the structure. The subject was discussed by the Geological Society of America.

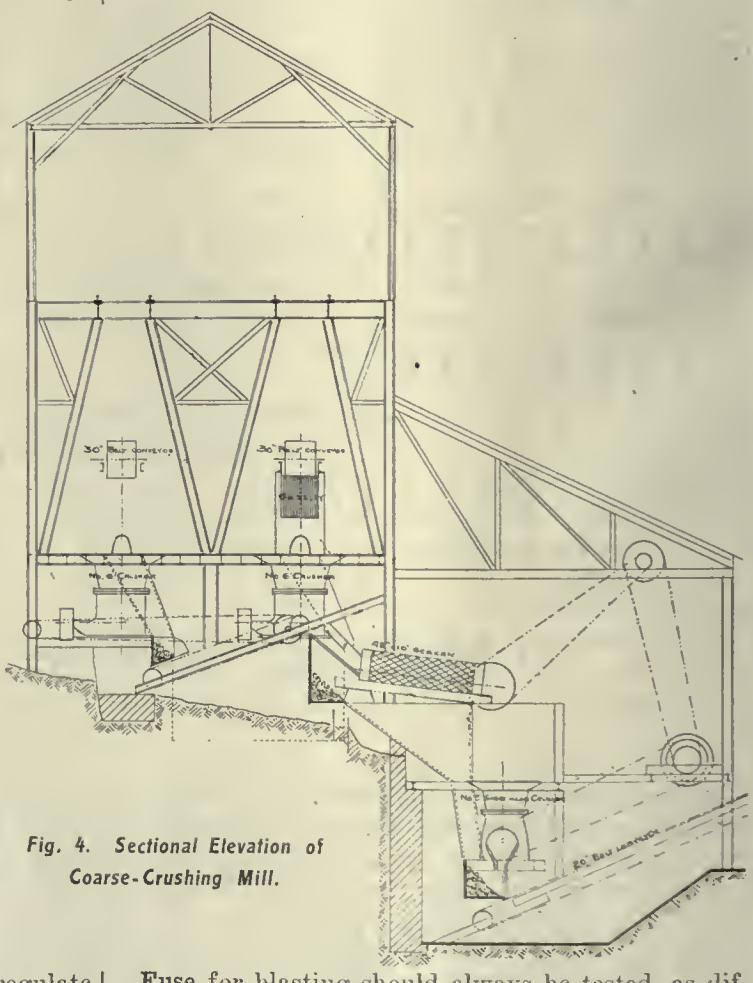

Fig. 4. Sectional Elevation of Coarse-Crushing Mill.

Fuse for blasting should always be tested, as different lots may possess irregular rates of burning. It should also be carefully handled so as not to disturb the powder-core.

NITRATE OF SODA INDUSTRY OF CHILE.—I.

Written for the Mining and Scientific Press
By S. H. Loram.

A full description of the nitrate industry with its diverse conditions and enormous area, would fill a fair sized volume, in fact has done so in the excellent report of Doctors Semper and Michels, made for the German Government in 1903, and translated into Spanish with considerable addition by Gandarillos and Ghigliotti in 1907. Also data are available in Dr. Darapsky's 'Das Department Taltal', and in other smaller works in English, German, and Spanish, too numerous to mention.

The western slope of the Cordillera of the Andes in Chile is desert country from Lat. 18° to 28° S., and within narrow limits, namely from Lat. 19° 30' to 26° S., comprising the drier portion of this region, are found the deposits containing nitrate of soda. The cross-section is indicated by the topography. There are some irregularities, notably in part of the Taltal district. Moreover the coast range is repeatedly cut by narrow valleys running down to the Pacific; while the main valley is often partly or totally broken by ranges of hills having a general westerly trend. The coast range for the greater part of its length is made up of diorite and aphanitic volcanics, while the western range of the Cordillera, is principally composed of curite. Between the two are some patches of limestone, probably Jurassic; but the bulk of its main branches is covered with a marine deposit of alternating beds of sand, gravel, and clay, formed during the uplift of the southern portion of this continent. Fossils are absent, but from its similarity to deposits farther south, it is deemed to be of late Miocene age. This is covered by a deposit of partly stratified mud and angular fragments from the later sub-aerial denudation of the surrounding hills. Workable nitrate is found exclusively within what corresponds to this north and south valley, and, with few exceptions, in the above-mentioned surface deposit. There seems to be little connection between its composition, or that of the surrounding rocks, and the nitrate of soda; the nitrate may exist mixed with the decomposition products of dioritic or curitic rocks. When in the neighborhood of limestone, there seems to be a decided increase in the proportion of calcium nitrate.

As the deposits are found at altitudes varying from 500 to 2000 metres above sea-level, and over nearly seven degrees of latitude, the climate varies according to the location, but in general the region east of the coast range is one of extreme dryness. It is so dry that an ivory billiard-ball, kept with the usual care, will crack and become useless in three months. On the other hand, though said to be a place where it never rains, this is not correct. Through long periods there occurs a cycle of change, occupying perhaps 15 or 20 years. Rain sufficient to run off the surface in the nitrate region is an extremely rare occurrence, and is then generally caused by a short violent storm. The last one in Antofagasta was in 1882. The variation of temperature between day and night is extreme, often amounting to 20° C. On the nitrate grounds there is generally a strong wind blowing from the sea to the Cordillera during the day, and from the Cordillera to the west at night; with about two hours comparative calm at sunrise and sunset. The most peculiar climatic feature is the dense fog which forms along the western side of the precipitous coast-hills almost every afternoon, and especially in winter. It is probably caused by the cold wind from the Cordillera meeting the warm damp air from the sea. It is piled up against the coast by the eddy caused by the same east wind passing overhead. On the coast this fog-bank usually rises to about 1400 metres, and as the hills are for the most part higher than this, the bulk remains against them, and is sufficient to support scanty vegetation and to form numerous water-holes and springs. Wherever the coast hills are lower, or where a valley cuts through them, the fog rolls up and spreads on the comparatively level ground of the north-south valley beyond, where it remains until the next day's sun drives it off. This fog covers a larger region than the nitrate-bearing ground, but, on the other hand (with few exceptions which can be explained), there is no nitrate found where the fog does not reach, and there seems little doubt that a direct relation exists between the two. The only river in the entire region is the Loa, which, rising in the high Cordillera on the Bolivian frontier, passes Calama with a volume of from four to seven cubic metres per second, varying with the season. Springs and small streams from snow-water exist high up the flanks of the Cordillera, but run for a short distance only; many are caught and carried by pipe-line down to the nitrate grounds, but a larger quantity of the water finds its way down between the beds of marine deposit in the valleys, and wherever there is drainage-connection with the Cordillera. Sinking through these has given the supply upon which most of the nitrate works depend.

'Caliche' the local name given to the nitrate-bearing mixture, is of extremely varied composition and character, ranging from almost pure nitrate of soda, down to traces only; the balance is made up of earthy matter (stones, sand, and clay) salt, sulphates of soda, lime, and magnesia in different proportions, sometimes containing smaller amounts of nitrate of calcium and potassium, perchlorate of potash, and iodate of soda. The following analyses may be taken as typical:

	I.	II.	III.	IV.
Nitrate of soda.....	29.35	39.44	31.90	25.50
Chloride of soda.....	42.72	4.18	8.00	41.86
Sulphate of lime.....	3.61	3.25	7.00	1.97
Sulphate of magnesia.	0.61	3.97	6.90	5.99
Sulphate of soda....	4.72	....	8.60	13.75
Nitrate of potash....	....	....	....	0.545
Perchlorate of potash.	0.18	....	....	Trace
Iodate of soda.....	0.104	0.089	0.033	0.136
Chloride of magnesia.	....	3.87	....	....
Moisture	1.03	....	2.40	2.97
Insolubles	17.59	45.24	34.30	7.28
	99.914	100.039	99.133	100.001

The grade of caliche usually worked, depending on economic conditions, varies between 50 and 18% nitrate of soda, the average being about 25%. The richer portions are crystalline masses; white, when only mixed with salt; yellow, when rich in iodate

of soda; pink, from iron or manganese; violet, stated to be due to a hydrogen carbide; and of various other shades due to earthy impurities. The bulk of the material worked is a light reddish brown compact mass, which shows crystal faces when burned in the hand, but at first sight has somewhat the appearance of typical eurite. Its toughness depends largely on the composition. Generally a 2 ft. 6 in. cube would be broken with a sledge hammer, but if much sulphate is present a block of this size would be more economically cracked with a small charge of dynamite. The specific gravity of pure caliche is 2, but for calculating the weight of a given volume in bulk 1.5 is taken, which includes porosity. As before stated, sub-aerial denudation products cover the marine deposits in the valley bottoms, and the lower slopes of the surrounding hills of the whole region; the surface of this deposit is covered with wind-polished stones, the finer particles having been blown away until a protection is formed. Immediately underneath these is a loose powdery earth, generally from 20 to 40 centimetres thick, often containing quantities of calcium sulphate (thenardite) as white powdery crystals. Below comes the ordinary talus of stones and earth that rests on the marine deposit, or on the rock bottom if farther up the slope than the former reaches. Where caliche is found, it is generally on the slopes, and particularly around the base of the hills; toward the lower or central part, it thins out or disappears altogether; sometimes it shows up on the surface, but generally below the loose powdery earth is a layer of semi-compact sandy clay, containing small quantities of nitrate of soda, considerable salt, and sulphates of soda and magnesia. This covering varies up to 3 metres in thickness. On an average it is about 50 centimetres. Directly underneath comes the caliche, rarely occurring as a uniform bed, but usually in flattened masses of varying thickness and of irregular outline. Its economic value naturally depends upon the assay-value, the depth of overburden, and the situation with reference to the works, but commercial limits may be said to range from 30 cm. upward. Its extreme thickness rarely exceeds 4 m., while the average is about 60 cm. Between the caliche and the talus there is frequently, but not always, a bed of fine earth containing more than half its weight of a mixture of salt and sulphates of soda, magnesia, and lime, grading on the under side into the ordinary deposit of angular fragments, sand and debris. In Tarapacá above the caliche is found a porous friable crystalline deposit known as 'costra.' Its composition is approximately as follows:

	Per cent.
Nitrate of soda	13.6
Nitrate of potash	1.7
Chloride of soda	27.2
Sulphate of soda	....
Sulphate of lime	3.8
Sulphate of magnesia	7.5
Chloride of magnesia	0.4
Iodate of soda	0.1
Moisture	2.6
Insolubles	42.2
	99.1

For quarrying the caliche, low-grade powder is employed, which is made at the works, from nitrate of soda, sulphur, and coal-dust. The loose surface earth is cleared away, and holes about 7 in. diam. are drilled vertically through the caliche by 'jumping' with a sharp pointed steel bar, or blasted out in small portions with dynamite if too tough for the bar, and then chambered in the soft ground below to hold the necessary charge. Work is started by opening a trench at right angles to the direction in which the excavation is to proceed, and deep enough to reach below the bottom of the caliche; this is then carried broadside across the ground to be worked, as regularly as the payable caliche permits, like a single bench in a stone quarry. After each blast the earth and waste are stacked at the back of the trench, the caliche sorted out, spalled clean, and piled on top in pieces as big as can be comfortably lifted, ready for transport to the works, either by mule-cart, broad-gauge, or portable railroad. For isolated or thick beds of caliche, holes 30 to 40 cm. diam. are put down and chambered by small boys. The charge of powder in such cases is often as much as 200 lb. Both methods are incomplete and wasteful, fully 25% of the caliche being lost. As the workmen are paid by the cart-load extracted, there is a further tendency to leave behind the thinner portions, which are afterward covered with waste, and lost. Against machine-drilled holes, steam-shovels for stripping the over-burden, and other mechanical appliances, it has been argued that the irregularity of the deposits would be an insurmountable difficulty. Little, however, has been done in this direction by competent persons.

Apart from the main deposits of caliche already described, it is found in Tarapacá filling cavities in limestone, when, according to Darapsky, a considerable quantity of calcium nitrate is present. Deposits of this type have been worked underground as mines to a depth of 30 to 40 ft., and are known to continue deeper, but not under paying conditions. Farther up the slopes of the hills, above the sub-aerial deposits, the rock in place is often broken and is decomposing to a depth of 50 to 60 cm.; this is occasionally cemented with, and covered by, caliche, which is generally free from earthy matter and of high nitrate assay. The whole has a covering of wind-blown sand, but the total depth is small, shading into solid rock below. It is also found on the surface of some salt-pans, formed by underground water that has passed through the nitrate region and come to rest in a land-locked depression where it evaporates. In the Salar del Carmen in Antofagasta, which is of this origin, nitrate crystallizes upon the surface and is worth removing about every four or five years. It has been cited as a case where nitrate 'grows,' and has led to a confusion as to its origin.

Although the above deposits have been, and still are, worked, the product is a quite insignificant proportion of the total. Nitrate of soda has also been found to the east of the main north-south valley, between the western and central Cordillera, as at Maricunga in the Department of Chañaral, but these deposits are quite small, and of scientific interest only.

Attempts have been made to explain the origin

Saltpetre District of Antofogasta, Chile.

Translation of legend: Distrito Salitrero, Saltpetre district; caminos, roads; aguadas, swampy ground and watering places; mineral, mining camp; salar, saline deposit; pertenencias salitreras, saltpetre claims; ferrocarril en esplotación, railroad in construction; ferrocarril en proyecto, projected railroad; caminos de herradura, bridle paths; cañerias de agua, ditch or pipe-lines; limites de Departamento, State boundaries; quebradas, narrow valleys or gorges.

of the nitrate deposits by several theories, the chief of which are here given.

Noellner's sea-weed theory predicates that during the elevation of the continent, large, almost land-locked, seas containing enormous growths of sea-weed were drained, and the decomposing sea-weed producing ammonia in the presence of salt and carbonate of lime, formed nitrate of soda. Against this lie several important objections, such as the absence of bromine and phosphorus in caliche, although both are found in sea-weed, and more particularly the fact that the caliche is not found in the marine beds, but is inter-stratified in the upper portion of the talus deposits often 50 ft. thick, lying on the top of them, where the marine deposits do not exist.

Muntz and Plagemann's microbe theory is based on the known formation in several parts of the world of calcium nitrate from decomposing organic remains, under suitable climatic conditions in the presence of calcium carbonate. The theory has been extended to the Chilean deposits by supposing this to have taken place in the presence of salt water containing iodine, the nitrate of lime being afterward decomposed by sodium chloride with the formation of sodium nitrate. The present deposits are supposed to be concentrations brought to their present position by water, and freed from phosphates by their greater solubility. In opposition to this it is objected that there is no satisfactory explanation as to the origin of organic remains in anything like the required quantity, and still less to account for the complete disappearance of all traces of such, while the position of the nitrate deposites on the slopes, as distinct from the salt-pans in the hollows, is entirely against their having been deposited from evaporating solutions, particularly in quantity sufficient to reach their present level.

In the guano theory of Ochsenius, it is assumed that carbonate of soda was formed by passage of CO_2 through salt-lakes in the central Cordillera, and that waters charged with sodium carbonate burst or filtered through the intervening mountain chain, and were detained against the coast range, where wind-blown nitrogenous matter from the guano deposits on the islands off the coast had been added, the decomposition of which produced nitrate. Apart from extreme improbability in general, in which an inadequate supply of guano is conspicuous, it is open to the last objection made against the previous theory, particularly as many of the nitrate deposits rest on slopes that have uninterrupted drainage to the Pacific. Pissis in his 'Desert of Ataeama' (Annals of the University of Santiago, 1877) stated his belief that nitrate was formed by the property of alkaline carbonates, in the presence of oxidizable matter, of converting atmospheric air into nitric acid; and that the feldspars decomposing to kaolin and alkaline carbonates in the presence of the oxidizing silicates of iron (mica, hornblende, etc.) provided the necessary conditions; while the occasional rains dissolving out the nitrate so formed on the hillsides, would precipitate it again around their bases.

An electrical theory is also advanced. The formation of ammonia from air and water—vapor under electrical tension, the conversion of this by ozone into ammonium nitrate, and this again by salt into nitrate of soda, has been put forward, and quite generally accepted; in fact Ochsenius at a later date admitted its probability as the chief agent, placing his guano-formed nitrate in the rôle of a 'nitrifying exciter.'

It is difficult to appreciate the electrical conditions of the desert without having visited it; but to those who have patiently waited for a frosty night in Europe to make experiments with Leyden jars and the like, it would be a 'happy hunting ground.' It is generally impossible or useless to comb one's hair without dampening it, the ends fly out as fast as brushed down. Often turning over in bed and bringing the hand near the iron bed-stead is sufficient to produce a 1½-in. spark, sometimes of intensity enough to be disagreeable. I have many times drawn a 10-in. continuous brush discharge from every finger-end to a copper-sewn leather engine belt, running over iron pulleys at about 1100 ft. per minute. Passing a cotton handkerchief once over the glass of a miner's dial, is enough to make one end of the heavy 6-in. needle stick to the under side. Under these conditions, it is reasonable to suppose that the wind-friction against the ground (particularly the hills) must cause almost constant minute discharges from every little projecting point.* This would lead to the production of oxides of nitrogen from the atmosphere, and where the wind meets with the fog rolling up from the coast, there would be moisture for the formation of nitric acid, which, either in the presence of carbonate of soda from decomposing feldspar, or of slate of marine origin, would form nitrate of soda. In fact here exists in nature the method employed for the manufacture of nitric acid by Bradley and Lovejoy applied by the Atmospheric Products Co. of Niagara, where a column armed with spikes is made to revolve inside a cylinder also lined with projections, sparking from a high-tension current taking place between the points on passing. The nitrate so formed would be concentrated around the base of the hills by the occasional showers (as explained by Pissis) which, without being sufficient to take the nitrate into solution in bulk, would be enough to cause it to creep down little by little, much in the way that a stalagmite grows, thus accounting for one of the frequent modes of occurrence noted by Semper and Michels. There would also be a tendency owing to the hygroscopic property of nitrate for the dew-bearing nitric acid to find its way down where nitrate already existed. It is well known on the nitrate grounds that early in the morning, after the fog, and before the sun has power to drive off the moisture, the nitrate-bearing area may be readily distinguished from the barren ground by its darkened color owing to the moisture on the surface, a phenomenon utilized in prospecting.

Toward the Cordillera, and at a considerable alti-

*I have noticed on several occasions that bringing a compass-needle within 6 ft. of a landmark, built to the same height as the instrument out of loose stones, was sufficient to cause a 2° deflection, when the composition of the rock certainly did not indicate the presence of sufficient iron to account for the movement on magnetic grounds, although it did not occur at the time to have watered the pile to prove the point.

tude there may be some deposits presenting exceptions to the general statement that the fog covers the nitrate-bearing area. At all events it may be a rare occurrence. But when the rapid elevation of the land is taken into account, Miocene marine deposits being found at 1400 m. above present sea-level, and even higher, it is possible that the nitrate may have been formed while the ground was at a lower elevation. Moreover, being small and poor as compared with those nearer the coast, they may be due to having been partly removed since their formation; or, being built up under adverse conditions, they may have never attained greater extent. With regard to the deposit of Maricunga at 3690 m. altitude, where certainly the coast fog never reaches, it is possible that the neeessary moisture may have been supplied by the lake, the nitrate being found from 50 to 100 m. above it. I do not know of similar deposits in connection with other lakes, but even if such existed, being of no value, their presence may easily have been unnoticed, or unreported, in the little known interior. One other general condition seems to be noticeable, namely, that where a north-south valley exists, the nitrate is found on the western side, that is, on the slope on which the east wind would impinge. This is shown particularly by the Toeopilla and Iquique deposits.* To estimate the nitrate content of a given area, lines of holes are bored similar to the smaller ones used for blasting, generally at intervals of 100 m. In each one the thickness of the caliche is measured, its character noted, and a sample taken by chipping a channel down one side of the hole. Under normal conditions anything less than 30 cm. thick, or under 18% nitrate of soda, is considered valueless and is left out of the calculation. The thickness of overburden is also noted. A plan is constructed showing the position of all the holes, and on this is platted the area of caliche proved. It is assumed that between two holes, one showing commercial caliche and the next one not, the payable deposit extends half way across. The total area of caliche-bearing ground is now calculated from the plan, and the commercially valuable contents arrived at in the following way: for each hole, the thickness of the caliche, in metres, is multiplied by the assay percentage of nitrate of soda, and from this result, if the assay gave under 30% $NaNO_3$, 35% is subtracted. If the assay gave over 30% $NaNO_3$, 30% is subtracted; if the caliche was porous, and a heavier loss to be expected in blasting, 40% is subtracted. This is supposed to cover loss by what is left behind or scattered by blasting, plus extraction losses, amounting to about 8% on the caliche that arrives at the works.

Taking the specific gravity (1.5) it is easy to estimate the weight of nitrate in metric tons that a given area is supposed to be capable of producing; but in several cases under exceptionally favorable conditions of even thickness of deposit, and where careful check had been kept, actual working results showed still about 10% below the calculated content.

Quarrying Caliche, Nitrate Fields, Chile.

In Tarapacá, where the 'costra' commonly carries 12 to 18% of nitrate, a separate calculation is often made of it, in addition to the caliche; and many of the older works with nearly exhausted grounds, depend largely upon it for their running. In the southern grounds it is limited, and often entirely absent. Ordinary working is effected by 'costra' in another way, the barren material that gets mixed with the caliche and leached, leaves the works with 7 to 8% of nitrate, a loss that is offset and sometimes more than made up for, in working grounds where 'costra' is abundant, as it replaces, at all events in part, the otherwise sterile mixture.

Alkali works are situated at Saltville, Smythe county, Virginia, where extensive beds of salt and limestone occur together, with abundance of coking coal cheaply available.

*In Antofagasta also the greater amount is on the west, although there is caliche on the lower part of the eastern slope.

COAL MINING IN THE MIDDLE WEST.

Written for the MINING AND SCIENTIFIC PRESS
By GEORGE H. CUSHING.

For the first six months of 1909 mining and allied interests in the Middle West were approaching the climax of the period of depression. For the last six months they have traveled almost as precipitately toward the crest of another boom. Early in the year coal companies engaged in an orgy of price-cutting in order to corral the contracts which are placed around the first of April. It was not unusual to hear about that time that contracts had been accepted at, or a few cents below, the actual cost of production of mine-run coal, and it was quite common for railroads to be able to place orders for steam lump on the basis of 95 and 96c. per ton at the mines. This is from 10 to 12c. below the lowest price made in the preceding ten years. Upon such a basis of price the amount realized for screenings could not bring the average for the mine-run coal up to the cost of production. Price-cutting went so far that a dispute arose over the contract figures at which the Dering Coal Co. should sell its tonnage to the United States Steel Corporation for the South Chicago mills. Because the Dering company would not accept prices which were common on the first of March, the long-time contract between those two organizations was terminated rather dramatically, resulting in the receivership for the Dering Coal Co. Dering coal going to the South Chicago plants amounted to about 2000 tons per day, and the diversion of this tonnage to other companies caused a rather rapid re-alignment of market connections, not altogether advantageous to the trade. The Dering company, closely affiliated with the Rock Island railroad, might have been able to command sufficient funds to save itself from insolvency, but certain other problems were involved, including the relation between the parent organization and a number of subsidiary companies for which it was selling-agent. It began to be realized that the Dering company had been financed on the basis of extreme prosperity and was dependent upon its jobbing trade for sufficient revenue to pay fixed charges, which could not be met by selling coal from the company mines only, especially at the prices then prevailing. It was believed that no more opportune time could be found for the re-adjustment than in the middle of a period of business depression. Subsequently certain adjustments were undertaken, among them the sale of the Kelly mines to the Brunson Coal Co., which is closely affiliated with the United States Steel Corporation. The separation of the Oak Hill properties from the Dering, and their management by Jackson K. Dering, followed. The remaining mines were leased to the Brazil Block Coal Co., for which the Dering Coal Co. had acted previously as selling-agent. It is too soon to tell what will be the ultimate outcome, but it seems likely that if the reorganization is undertaken some time during 1910 the equity of the stock will be wiped out, and the property will be reorganized by the bondholders.

Several other and smaller companies went into the receivers' hands within the year, all as the direct outcome of the extremely low prices, the poor buying movement, and unfavorable general conditions. While not actually toppling over into insolvency, it is a known fact that some of the larger (and supposedly invincible coal companies) were seriously embarrassed within the year. All of these facts have led to a demand for remedial measures. It is freely declared by economists and government authorities, as well as by the operators themselves, that the basic wrong in the coal trade is the lack of balance between domestic and steam-coal prices. It is not implied that the former are too high or are in any way unjust, but it is declared unequivocally that the steam-coal prices are entirely too low. The sale of screenings, for instance, on an average basis of 40 or 45c. per ton at the mines, and the sale of railroad steam-coal at less than $1 are declared to be out of line with the cost of production, even without consideration of overhead charges and profits. To remedy this situation a selling syndicate for all the mines in what is known as the Carterville or southern Illinois field, was discussed. It was subsequently planned to cover the whole southern and central Illinois territory. This proved to be in opposition to the Sherman anti-trust law, and was abandoned. A little farther to the east the same condition and the same distress resulted in the same proposal, and a selling syndicate or centralized organization was proposed in the smokeless territory of West Virginia. It was intended to divide the smokeless field into the New River and the Pocahontas districts, each of which should have a centralized organization, with possibly a dove-tailing of interests, the object being to prevent the extremes of competition. Because this, too, would be in violation of the Sherman anti-trust law, it also was abandoned, and a form of centralized organization in the New River field providing uniformity of preparation through the appointment of inspectors was substituted. All such efforts were ultimately given up. The individual companies, which had been doing business through the Pocahontas company, of which Castner, Curran & Bullitt were the selling-agents, dissolved relationship with the central organization and established individually their own selling organizations. The last end of the effort to control the smokeless condition is worse than the first because competition is now admittedly unrestrained.

Since all efforts toward fusion of the various coal interests have been violently broken because of the interference of the Sherman anti-trust law, the operators of the Pittsburg field, toward the end of the year, undertook to accomplish the most logical thing, namely, the revision of the law. The Pittsburg Coal Operators' Association appointed a comittee, headed by S. A. Taylor, of the Crescent Coal Co., which sought and obtained an interview with Mr. Taft. The President declared that he was wholly opposed to any plan which would remove all forms of competition, but suggested that some mild restraint should be decided upon by the operators themselves. He proposed that, having selected a plan, they submit it to him in tangible form, and he in turn would present it to Congress.

Quite another phase of the fuel problem is pre-

sented in the somewhat rapid development of natural gas in the Middle West, beginning with West Virginia and ending with Oklahoma. Production and sale of gas in northwestern Ohio and northeastern Indiana have gone on logically, but naturally, to a point where there is practically no consumption of coal for domestic purposes in the immediate territory of the gas wells. The influence of the West Virginia field has been extending directly to the north and directly to the west, and then over a wide quadrant between. Gas has already been piped from the West Virgina field as far north as Cleveland, and facilities for handling it have been increased materially during the summer. Natural gas is quite a factor in the Cleveland coal trade. Within the last year, a company headed by Charles Davis, president of the First National Bank of Cincinnati, has succeeded in putting through a $6,000,000 deal for piping West Virginia gas to Cincinnati. On the extreme western end of the territory under discussion the gas companies are unable to supply the demand, and consumers are reverting to the use of coal. The Southern Pacific railway has gone into the market for a good deal of coal because insufficiency of the oil supply made it necessary to use coal on a certain number of engines in Texas. A good deal was purchased in southern Illinois. The influence of the Texas oil on the fuel business seems to be receding. While production of fuel oil in southern Illinois has not as yet reached formidable proportions, a great deal is being produced.

Toward the end of 1908 coal men were disturbed by the Mariana mine disaster, and coal men are firmly convinced that the explosion was occasioned by leakage of natural gas through some of the fissures in the coal into one of the working places. This brought out considerable talk about the loose method of casing natural-gas wells and the insufficient provision made for preventing its escape into adjacent coal mines. West Virginia was much disturbed recently over that same subject, and I. C. White, the State Geologist, urged that this matter be handled vigorously by the mining interests. About the same time there was a small explosion in the Leiter mine, in Franklin county, Illinois, which resulted subsequently in a disastrous fire in the coal, and caused the temporary abandonment of the pit. At the same time, there was a small explosion in one of the mines of the Rend Collieries Co., in Franklin county, Illinois. This, together with the previous explosions in one of the mines of the Dering Coal Co., aroused grave fears for the whole of the Franklin county field. It is now beginning to be appreciated that gas in the mines of southern Illinois, western Pennsylvania, and West Virginia is a factor with which operators will have to reckon seriously.

Another mine disaster of an entirely different character was that of the Cherry, Illinois, mine of the St. Paul Coal Co., on November 13, 1909. The start seems to have been solely the result of carelessness on the part of the mine workers, and would be devoid of engineering significance except for the possible consequences in the way of legislation. Following the disaster, the Governor, C. S. Deneen, issued a call for a special meeting of the legislature, one subject to be discussed being outlined as follows: "To enact laws providing for suitable fire-fighting equipment to be installed at or in all coal mines; to provide that all stables in and about coal mines shall be established above ground, or made fire-proof with cement or other material if placed below; to enact laws requiring that a designated area about the bottom of all coal-mine shafts shall be made fire-proof and safe for operation, for the miners who may be entrapped; and that stopes and drifts shall be properly protected." The issue is uncertain.

These developments have been dwelt upon to the exclusion of the improved condition which has crept over the trade, beginning with the first of September. This improvement is really without significance, being incidental to the return of prosperity generally. Operators and consumers have believed that the period of depression was going to hold for almost an indefinite period, and made no provision for any such reversal of industrial conditions as actually has taken place. The operators sacrificed their product for what it would bring, and took long-time contracts at extremely low figures. Consumers, including the industrial plants and the retail dealers, failed to supply themselves with coal ahead of time, and as a consequence winter has approached with practically no provision made, and with a car shortage through the entire territory. Prices have risen in the last three months, in some instances 100%, and even at that there seems not to be enough coal to go around. Add to this the strike of the switchmen in the northwestern States, and the fear that we are in for a prolonged labor struggle on the railroads, and the situation is really serious. Not the least of the troubles is that of the operator who finds himself confronting high prices with low-price contracts to fill.

One of the most famous gold mines of the State of Sinaloa, Mexico, is known as the Minas del Tajo, at Rosario, a short distance north of Mazatlán. This mine made the fortune of the Bradbury family in Los Angeles, and it seems destined to a long life. During the past year the ore has averaged, gold 0.27 and silver 6.5 oz. per ton, and a total extraction of 90% has been obtained. The ore treated within the year amounted to 70,000 tons. The cost of operation was $3.45, of which $1.88 was for mining and development, and $1.57 for milling and cyaniding. The slime in the cyanide plant is treated with the Oliver rotary filter. The mine workings are very extensive, there being 80 miles of workings above the 500-ft. level. The San Antonio shaft has been sunk to a depth of 600 ft. within the year, this being the lowest limit of development yet carried out.

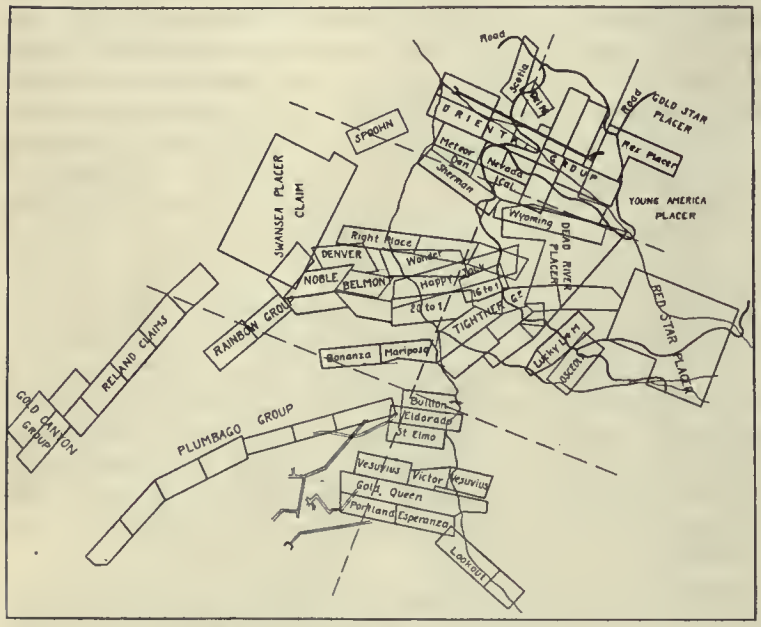
Basalt is by some prospectors regarded as evidence of a poorly mineralized country. There is no warrant for such an opinion, except as regards special conditions. Basalt is associated with ore deposits in many parts of the world. To cite no further examples, a prospector would have made a great mistake to have gone away from the Rico district, Colorado, or the Clifton district, Arizona, because he saw some basaltic dikes.

MINING AT ALLEGHANY, CALIFORNIA.

Written for the MINING AND SCIENTIFIC PRESS
By F. L. LOWELL.

The Alleghany mining camp is situated in Sierra county, California, at an altitude of 4500 ft. It did not claim much attention from mining men until an exceptionally rich find of bonanza ore was made in the Sixteen-to-One mine on April 1, 1909. The wide publicity given to this event attracted investors, and during the past summer, men from all parts of the country have paid the camp a visit and there has followed an expenditure of considerable money in new development. The unfortunate litigation involving the Sixteen-to-One mine has temporarily deprived the camp of a valuable producer, but this is not a 'one mine camp', as the amount of bullion produced by the different properties testifies.

The most thoroughly exploited vein is the Tightner contact upon which are situated the Tightner group, Rainbow group, Red Star placer, the Rainbow Extension, and the Twenty-One claims. These properties are all working. The big discovery in the Tightner was made in 1904, and a large amount of rich ore was extracted from the upper workings. Some of the milling ore is on the dump awaiting the erection of a mill. H. L. Johnson, the owner of this mine, is driving a lower adit to cut the pay-shoot at greater depth. This contact has a hanging wall of serpentine and a porphyry foot-wall, and the vein dips 45° to the east. The vein may be cut at any moment, as the talc lying between the serpentine and the vein has been reached. The adit has been driven by hand, no power being available for machine-drills.



Map of Claims, Allegheny District.

On the south side of Kanaka creek, on the same vein, is the Rainbow group, upon which considerable development has been done by the former owners, and from which considerable gold was taken. This group of claims is under bond to Coloradans, and is being operated by L. P. Woodbury, president and general manager for the company. The Rainbow is developing and stoping in the lower adit on Kanaka creek, and is also repairing and opening the old workings of the upper adit. The company has a water-right on Kanaka creek, also one on the north fork of the same creek, and with the new flume put in this summer the 10-stamp mill is able to run the year round. This mine has taken out some 'specimen ore' under the present ownership, and is crushing ore from stopes in the lower workings. The company is contemplating putting in a new compressor, in which event considerable new ground will be opened.

On the north end of this same vein is situated the Red Star placer mine which is patented ground. It is also under bond to Coloradans, and L. P. Woodbury is president and general manager. On this property, an adit is being driven to cut the Tightner vein, and the present company has expended considerable money. There is a 1-stamp Nissen mill on this property crushing ore from the Osceola vein, and a Wilfley concentrating table, both driven by a Fairbanks-Morse gasoline engine. During the summer months, when water is insufficient, the long adit is ventilated by a fan, driven by a Fairbanks-Morse gasoline engine, which also furnishes power for the electric light plant.

Both the Twenty-One and the Rainbow Extension claims came to notice last summer, good discoveries of rich ore having been made. This contains both free-gold and arsenical sulphides. The Twenty-One is controlled by California people, and is under the management of F. N. Phelps. The Rainbow Extension is controlled by San Jose people, and is managed by O. A. Harlan. The Eldorado claim, owned by Fessler brothers, and under bond to H. L. Johnson, has been working all summer, and the 10 stamps kept going until water became short. The mill has been closed for the present. The vein on this claim is well defined, and shows a strong outcrop where it joins the Hope Extension, the northern claim of the Plumbago group. This group is owned by New York people, and has been under the management of Mr. Mather for a number of years. He was succeeded by C. W. McMeekin who is pushing the work of development vigorously. This property consists of 7 claims, and has produced handsome returns on the money invested. The company owns a water-right on the middle Yuba river, and develops power for the working of the mine, and also furnishes power for the Gold Canyon mine which is farther down the river. The Plumbago has a modern plant including a 10-stamp mill, machine shop, compressors, and electric plant, its power-house being one of the best equipped in the county.

The Gold Canyon, which is not far from the Plumbago power-house, has been bonded by Eastern people, who have been putting the mine in shape this summer so that it is now equipped with compressor and hoist, and has run its 5-stamp mill for a part of the season. Unlike most of the properties in this district, the Gold Canyon is a deep-level mine. The greater part of its production in former years has

been taken out of a shaft sunk below the bed of the Middle Yuba river. There has been trouble with water until the installation of sufficient power to cope with it. It has been a good producer and has a good future. Charles Smith is superintendent. The Oriental group of claims is one concerning the output of which there is little known. It certainly has been a good mine, and the rumor is current that Mr.

Alleghany, California.

Mather, who controls the stock, will endeavor to reopen the mine next spring. Perhaps the most remarkable discovery in this distrist lately has been the uncovering of a large rich orebody in the Sixteen-to-One claim, which is close to the town of Alleghany. This claim was under bond to Wilson and Van der Bugle, and large quantities of ore, contain-

Tightner Adit.

ing both free gold and arsenical pyrite, were taken out. The quantity mined up to the time the mine became involved in litigation has been estimated at approximately $400,000, but the actual amount returned from the mill-run will not be known until the case is settled in the courts. From indications the vein appears to be a branch of the Tightner, and dips to the east also. There are several individual claims being worked in this camp that I have not mentioned, and I might say that any of them has a good chance of becoming a mine if the work is carried on with diligence, since the producing mines here had little to recommend them when taken up. With the advent of electric power next spring from the Pacific Gas & Electric Co., there should be a prosperous season, and more development will be undertaken than at any time in the past.

PHELPS, DODGE & CO. IN 1909.

Stockholders of Phelps, Dodge & Co. have received during 1909, $12 on each share of their holdings, the entire distribution for the year totaling $6,000,000. The output of the company's mines for the current year will approximate 134,000,000 lb., and, assuming that the disbursements represent the entire earnings for the year, the company is making a profit of 4½c. per pound. As a matter of fact, the company is probably turning out the metal at a cost of nearer 8c. per pound than 9, since the above calculation on costs makes no account of surplus requirements. In the following table comparisons of production and rate of distribution in former years on the basis of the new company's capitalization are given:

Year.	Production Pounds.	Dividends Paid.	Rate Per Cent.
1909	134,000,000	$6,000,000	12.00
1908	115,871,304	3,480,000	6.90
1907	90,955,963	4,010,000	8.02
1906	112,281,878	8,224,000	18.40
1905	89,418,083	3,184,000	6.30
1904	77,637,595	2,000,000	4.00

During 1908, the Phelps-Dodge properties earned about $5,500,000 available for dividends. During the present year production has increased steadily from month to month, enabling the company to show lower costs and lager earnings. The company sells its own metal to a clientele of many years standing. Its stock is closely held and transactions are rare. The last sale recorded was at 197½.—*Boston News Bureau.*

New light on the geology of the Wasatch mountains was shed by Eliot Blackwelder at the recent meeting of the Geological Society of America. The past season's work of the United States Geological Survey in the Wasatch and Bear River ranges of Utah, has added several facts of importance to the current interpretation of the structure and stratigraphy of the region. The Weber quartzite thins rapidly north and northwest of the type locality and there is evidence indicating that this thinning has been caused by erosion during the Pennsylvanian period. The Ogden quartzite appears to be neither Devonian, as first reported, nor Ordovician, as stated in more recent years, but merely a repetition of the lower Cambrian quartzite upon a large overthrust. The great body of 'Wasatch quartzite' of the King Survey was found to be separated from the known Cambrian quartzite by a distinct although readily overlooked unconformity.

Sulphide determinations in alkaline cyanide are discussed by Ewan as follows: (1) The rapid 'works' method consists in dissolving 10 gm. of the sample in 15 c.c. of water, and titrating with a standard solution of $Pb(NO_3)_2$ until a spot-test of the liquid shows no brown on a paper moistened with a Pb solution. Some oxidation of the sulphide always occurs. The results should be multiplied by 1.25. (2) Colorimetric methods are only accurate when the conditions of concentration, presence of certain salts, are identical in the standard solution and the one tested. (3) Feld's method—distilling with $MgCl_2$ in a current of CO_2 and passing the H_2S into I solution—is accurate but troublesome.

Discussion.

Readers of the MINING AND SCIENTIFIC PRESS are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy. The Editor welcomes the expression of views contrary to his own, believing that careful criticism is more valuable than casual compliment. Insertion of any contribution is determined by its probable interest to the readers of this journal.

Bullion-Tax Law in Nevada.

The Editor:

Sir—Referring to your recent editorial on the above subject, I wish to say that in looking over the authorities on accountancy, I find them practically agreed that depreciation on mines, and their dependent plants, is in direct proportion to the amount of mineral extracted, but that the law does not require that a mining company shall write off a commensurate depreciation before declaring a dividend. This seeming inconsistency in the law may have its cause in the general beliefs that in accountancy mines are regarded as non-permanent undertakings, and that, viewed in this light, no system of accounts can be adopted that will insure that the capital in such an undertaking will always be maintained intact. The stockholders in the average mining undertaking object strenuously to a depreciation charge, on the ground that it leads to the accumulation of large sums of money in the hands of directors, earning a low rate of interest at the best, which might be distributed as a dividend, although in point of fact such sums constitute a return of capital, which might, through re-investment, be the means of perpetuating the undertaking. Therefore, while the law does not require a depreciation charge, it is still optional to embody such an element in the accountancy of mine and reduction plants. Such a charge would then be such proportion of the total cost, less residual value of plant, as the year's output bears to the estimated total producing power of the mine. The erection of a customs reduction plant in an isolated district is only justified when the profits accruing through the treatment of its tributary ores will repay the capital invested, and pay in addition a return on the same, commensurate with the venture. In other words, the cost of the site, the plant, and the maintenance, are directly chargeable to the estimated tonnage of ore that can be treated. This can either be expressed in a depreciation charge, based on the relation borne by the annual capacity to the total estimated tonnage of the contributing sources, or as a charge per ton, to which, in the treatment charge exacted from shippers, is added a sum that will be a return on the total capital invested.

The same kind of procedure is adopted by a contractor who has installed a material-handling plant, say a steam-shovel, with which he contracts the handling of a stated amount of material. His estimate as to the cost of doing this work always includes the price of the plant, plus the labor required, and a reasonable return on the capital so invested, expressed in cost per cubic yard of material. Having completed this contract, his plant is worth simply its salvage value, which, in isolated districts, amounts to practically nil. In the event the competition is strong, his charge for return on capital invested is proportionately less than in cases where he practically commands the situation. The same line of argument applies to reduction plants competing for the treatment of ore, such as are situated in districts they can command by virtue of contracts, the existence of prohibitory freight rates to other plants, or through special forms of treatment controlled by them under patent. Concerning the depreciation of the machinery constituting ore-handling or treatment-plants, the depreciation is governed by wear and tear through becoming obsolete as a cheap means of handling, or through becoming unfitted as an element in a plant requiring to be re-adjusted in order to meet changed ore conditions.

Summing up the above, I consider that in mine and reduction undertakings, depreciation constitutes an equitable charge against revenue. Reserve capital so created through the return of capital giving greater elasticity in that it can, through re-investment, be made the means of perpetuating an undertaking. While this course is not followed by many operating companies in the United States, still a number are accomplishing the same result through re-investment of their surplus earnings, for instance, the Calumet & Hecla, which is purchasing additional territory so as to prolong its career.

BULLION-TAX PAYER.

Reno, Nevada, December 20.

Modern Quicksilver Reduction.

The Editor:

Sir—In your issue of November 20, 1909, there appeared a note by myself drawing attention to the fact that, on the whole, much more than 20% of the mercury in modern quicksilver furnaces is obtained direct as free metal from the condensors, in contradistinction to that obtained by working over or retorting the soot. This note was reviewed in your issue of December 4 by Clifford G. Dennis, and in that of December 11 by Arthur Feust, of New Almaden. As Mr. Feust states, the amount of soot is dependent: (1) on the character of the ore; (2) on the grade of the ore; (3) on the kind of fuel.

It was my fortune to visit all of the producing quicksilver mines of California in 1883-1885. At that time most of the mines were operating on a fair grade of ore, and certainly the larger part of the quicksilver produced came out as free metal. It would appear from a paper by S. B. Christy on New Almaden that in 1882, about 96% of the mercury produced came out as free metal, and 4% was obtained from the soot. In conversation Clifford G. Dennis stated that during the time of his residence at New Almaden about 87% of the mercury came out of the condensors as free metal. As there are presumably complete records on this point at New Almaden, it would be interesting if Mr. Feust could give us the benefit of them. The veteran quicksilver miner of California, J. W. C. Maxwell, who was superintendent of the New Idria mine for many years, states that from 1872 to 1884 at least 70% of the mercury produced came out as free metal, the ore at that time being of a good grade. Mr. Maxwell also states that at Sulphur Bank, in Lake county, where there was an excess of sulphur in the ore, probably only 10% of free metal was produced. In this case the character of the ore was the domi-

nating feature. I am indebted to B. M. Newcomb, manager of the New Idria and Oathill mines, for the following facts: At the Oathill mine in 1908, 72% of the product was free metal; and in 1909, 62%. At the New Idria in recent years only 42 to 50% of free metal has been obtained, the remainder, or more than half, coming from the soot. Mr. Newcomb states that he had less soot when using oil fuel than when using wood fuel. John Andrews, superintendent of the Great Western mine, in Lake county, using a Litchfield furnace, informs me that while no exact record was kept, not more than 20% of the mercury was obtained as free metal in recent years, and that at the small furnace of the nearby Helen mine practically all the product is soot.

It is thus evident that with certain ores, as those rich in sulphur or in hydro-carbon, the amount of free metal in quicksilver furnaces is often much under 50%, and also when wood fuel rich in pitch is used, much soot may be expected, while the coke, as in the Neate furnaces of the St. Johns mine at Vallejo, little or no soot should be formed. This would likewise be true in furnaces using producer gas.

Leaving out of consideration any particular mines or ores, it would be more happily put to say that the bulk of the mercury of the world comes out of the condensers as free metal, but on this point the records at the Almadén mine of Spain would need to be examined. The larger part of the California production has come from the New Almaden and the New Indria mines, and it would appear that my original statement of a production of over 70% of free metal was true of these mines for a long series of years, and at the time of their heaviest production. It is also true of the most prolific of the Texas mines, the Marfa and Mariposa, during 1904-05. According to Spirek, it was also true of the Monte Amiata mines in Italy for a period of 15 years preceding 1900.

Researches Upon Cripple Creek Telluride Ores.

The Editor:

Sir—In the letters which were published in your issue of November 20 last and of December 25, referring to the article, 'Researches Upon Cripple Creek Telluride Ores', which appeared in your issue of September 25, 1909, your correspondents appear to be unaware of the fact that the discovery of the solvent action on gold in ores of a solution of cyanogen iodide and potassium cyanide is nearly as old as the cyanide process itself. W. H. Gaze proposed the use of this solvent about the year 1888, and in 1889 the first cyanide work which I did was some tests comparing the action of a plain solution of cyanide and the iodide solution on a gold ore. If the improvement in the solvent action of the solution is due to the presence of cyanogen iodide, it is difficult to see why such an expensive method of forming it should be proposed as the use of a persulphate and an alkaline iodide. There are much cheaper methods of making cyanide iodide. The use of cyanogen bromide ('bromocyanide') was strongly advocated at one time, but with the exception of a single mill in Western Australian one does not hear of its being in use. Not only the cost of the extra chemicals is against their usefulness, but to get any benefit from them great care has to be taken that the solution is neutral or slightly acid. By 'acid' is not meant acid to litmus, but that the solution contains a trace of free hydrocyanic acid. In the laboratory high extractions can be obtained by the use of extra chemicals, but it is often overlooked that the cost of these chemicals may be considerably more than the value of the larger amount of gold extracted above that extractable by plain cyanide.

Estimation of Cyanide in Mill Solutions.

The Editor:

Sir—The standard silver nitrate solution used for estimation of cyanide in solution is made by dissolving a quantity of $AgNO_3$ in one litre of water. The authorities quoted recommend quantities as shown. Is it not time that this confusing variation be recognized and the discrepancy adjusted? The quantities recommended by different authorities are: Eissler, 13.05 gm. $AgNO_3$ to 1 litre water; Lodge, 13.056; Wilson, 13.07; Furman, 13.07; Berringer, 13.076; Clennell, 13.038; W. H. Leamon, 13.038; C. H. Jay, 13.04; Mining and Scientific Press, 13.07.

The values given to the atomic weights of the elements entering into the composition of silver nitrate and cyanide of potassium are responsible for the difference in the above figures. The equation

$$AgNO_3 + 2KCN = AgK(CN)_2 + KNO_3$$

represents the chemical reaction.

If the values given by the Committee on Atomic Weights (*Jour.* Am. Chem. Soc., XXI, No. 2) are used the following result is obtained:

$$\begin{array}{cccccccc} Ag & N & O_3 & + & 2K & C & N & \\ 107.11 & + 13.93 & + 47.64 & & 38,82 & + 11.91 & + 13.93 & \\ & 168.68 & & & & 2(64.66) & = 129.32 \end{array}$$

This gives 13.043 gm. $AgNO_3$ diluted to one litre, as the correct standard solution. If the figure given in The *Journal* of the Chemical Society (London), January 1904 be accepted as the International atomic weights, another figure is obtained, as follows:

$$\begin{array}{cccccccc} Ag & N & O_3 & + & 2K & C & N & \\ 107.12 & + 13.93 & + 47.64 & & 38.86 & + 11.91 & + 13.93 & \\ & 168.69 & & & & 2(64.70) & = 129.40 \end{array}$$

This gives 13.036 as the standard weight of silver nitrate. Which is the correct quantity to use in practical cyanide work?

Algernon Del Mar.

Sumpter, Oregon, November 24.

Cadmium comes mainly from zinc ore, though small quantities of this comparatively rare metal are contained in some lead ores. The world's cadmium output is derived largely from Silesia, but within the last two years the metal has been produced in the United States, and the value of the annual imports of cadmium has dropped during that time from $10,500 to $2300. The zinc ore of the Joplin district contains as high a percentage of the metal as the cadmium-bearing zinc ores of Silesia.

JOHANNESBURG, TRANSVAAL.

French Rand Closing Down.—'Modified' Blasting Gelatine. — Rapid Driving.—Neumann Mines.—Chamber of Mines and Superfluous Statistics.

The French Rand G. M. Co. is to be immediately closed down. Not even development will proceed. Although the difficulties of the mine have been well recognized by all acquainted with conditions underground since the exhaustion of the big runs of rich ore, and although little hope of profit has been held out in view of backward development and short labor-force, there has been considerable disappointment at the final decision of the Board. It was generally hoped that the money would have been found, somehow and somewhere (it is usually brought forward boldly enough by the Eckstein firm), to enable development to proceed. The closing of the mill alone, which has been losing heavily of late, would have caused no sorrow. The October returns showed a loss of £7300, the tonnage having been low. Apart from decreasing grade and a multiplication of faults, there have been factors contributing to the company's failure which can only be classified as ill-luck. For instance, in February, development and rock-hoisting operations were disorganized by floods, following the unexampled rains. As a dry mine, the French Rand was quite unprepared. Then later on, labor got scarcer, the supply falling 30% in six months. Some may be surprised to hear this outcry about the closing of a mine which will affect the Rand output to the extent of but 0.5%. But it is the 'principle of the thing'. The Rand has established such a remarkable standard of industrial stability that a complete failure of a Main Reef proposition is held to be a sorrowful disaster.

Some time ago I referred to the 'modified' blasting gelatine introduced by W. Cullen, of the B. S. A. Explosives Co., which was claimed to materially reduce the amount of carbon monoxide given off in blasting, without reducing its energy. There is now reason to question the assumption of undiminished strength. If it is less economical, it will be necessary to assure the mines that the CO is so much reduced as to appreciably influence after-blasting conditions, that the wrapper, for instance, is not still too important a factor to enable injurious effects to be removed. The opinions of practical men as to the efficiency of the modified explosive are widely divergent.

The East Rand Extension, a developing mine, lately reopened, under the control of the Consolidated Gold Fields, claims to have made a new record in driving footages. This rapid succession of development records in the East Rand is becoming monotonous, and makes one suspect that it must have been a district for the loafer in former days. However, all these recent records are dependent upon the 'point of view', for the recognition of highest achievement. There have now been declared, the following: New Modderfontein, 826 ft. in 156 consecutive shifts (two machines) in three months; New Modderfontein, 349 ft. in 62 shifts in two faces; Modderfontein B., 334 ft. in 62 shifts in a single face. The East Rand Extension now claims to set up a new record with 361 ft. in one month. But it appears that three 8-hr. shifts per 24 hours were worked, so that the footage per round must have been far less than the Modderfontein performances. The difficulties of shoveling, and the inconvenience of the gas, must be considered in the working of three shifts per day, but the advance per round is the crucial test of effective and economical progress, assuming normal conditions.

After Eckstein's, the Neumann group is probably the most efficiently controlled upon the Rand. The businesslike administration of the Anglo-French-Farrar combination leaves little to be desired, but a good deal of sound criticism could be launched at the methods of the other firms, in one department or another. Neumann's is undoubtedly one of the most progressive groups from the financial point of view, and has some important work on hand. The quarterly reports (to September 30, 1909) show that development results in the Main Reef West continue to be favorable, 1655 ft. on Main Reef Leader, averaging 7.8 dwt. over 48 in. South Reef, hitherto found comparatively unimportant in this mine, though the mainstay of properties to the west, averaged 5.5 dwt. over 36 in. The group's new producer, the Knight Central, whose equipment was only completed this year, crushed 62,490 tons for a yield of £76,681 (24s. 6d. per ton), and a profit of £18,727 (or 6s. per ton). The company of the group which merits principal notice from the general industrial standpoint (the Cloverfield Mines) is unfortunately able to give only a poor account of itself. The Cloverfield, near the Geduld, struck the reef only this year. During the quarter, 403 ft. were driven on the reef, disclosing 6.3 dwt. over 10.6 in., but hopelessly unpayable. The footage was small on account of water-troubles, but it is the poverty of the grade which occasions disappointment. There is 'room for improvement' in more senses than one; the property is large and the grade, so far, much below normal expectations, and bore-hole results were promising.

At the last meeting of the Chamber of Mines, L. Reyersbach, who is leaving Johannesburg to join Wernher-Beit's London office, made a plea for the abolition of detailed statistics, which are prepared each month by the Chamber. It may be noted that the monthly analysis of the Chamber of Mines is exceptionally full, and gives the following data for each company: (1) tons hoisted and taken from dump; (2) waste sorted out; (3) tons milled; (4) stamps erected; (5) stamps at work; (6) days milling, 24 hours; (7) duty per stamp per 24 hours, duties being always worked out over a full day of 24 hours to give a true reflex of work done; (8) number of tube-mills at work; (9) yield from milling in pounds sterling; (10) from cyanide; (11) total; (12) total fine ounces; (13) total per ton milled, in shillings and pence; (14) total per ton milled (dwt.); (15) working costs per ton milled exclusive of development; (16) amount spent per ton milled on development or development redemption; (17) total working cost per ton milled; (18) total working costs; (19) working profit; (20) working profit per ton milled; (21) sundry revenue; (22) capital of company; (23) dividends declared during month, (a) rate per cent, (b) amount; (24) dividends for year to date; (25) dividends for corresponding period of previous year; (26) remarks, with special reference to gold recovered from accumulations. Now, Mr. Reyersbach seeks to have this monument of labor abolished, and in its place, to initiate an annual analysis. He declares that this close comparison of monthly results drives managers to exert energies uneconomically in maintaining a steady grade—by distributing their workings over a wide area instead of centralizing. It is easy to understand Mr. Reyersbach's objection to useless labor, but the question arises whether the information compiled is not of sufficient practical value to outweigh the indirect influences and to justify the work involved in their compilation. The data provided would, to a large extent, have to be obtained each month for the guidance of the control, and in this case, the desire for an equalization of grade should still be manifest. The Chamber of Mines analysis, however, forms a convenient record and really saves an immense amount of compilation by others. Mr. Reyersbach is certainly right in claiming that such an analysis has some bad results, none more evident than the close comparison of costs between differently conditioned mines. On the other hand, it is probable that they are easily balanced by the good and by the spirit of confidence the publication of official details inspires in interested shareholders. Mr. Reyersbach must recollect that all mines on the Rand are not run as openly as those under his firm's control, and that the withholding of data might lead to manifold abuses, besides being a cause for endless rumors. Comparison was made with the more restricted information provided by the iron and coal industries of the States. It must be allowed, however, that the non-competitive mines of the Rand are on a different basis and there is nothing to gain by secrecy in any department. It would appear from reports of the West Australian Chamber of Mines sometimes seen over here, that

the Kalgoorlie output is analyzed each month with corresponding thoroughness. It would be satisfactory if Mr. Reyersbach would indicate in detail the influences of the non-publication of monthly records upon the working policies of the mines. If really beneficial results could be shown, the investing world would be more readily agreeable to the scheme. It must be recollected, however, that the aim of the majority of managements during the last year or two has been a reduction of costs, and, with the assistance of a gold-reserve, the control has made the maintenance of a standard output subordinate to economy of operation.

SALT LAKE, UTAH.

Utah-Boston Merger.—Nevada Con.—W. A. Clark Opposes Copper Merger.—Ohio Copper Mill.—Daly Judge Drain Tunnel.

Upon the return of Daniel C. Jackling, general manager for the Utah Copper Co., from the conference between the officials of his company and those of the Boston Consolidated, he stated that by the end of January they would have the transfer of Boston properties to the Utah Copper household. Mr. Jackling is now in Arizona inspecting the Ray and Gila mining properties. He will return by the middle of the month to arrange his staff for the handling of both mines at Bingham, and the three mills now being operated by these companies. The principal change in the staff of the two companies has already taken place. Lafayette Hanchett, general manager of the Boston Consolidated since its inception, has resigned, and in February he will sail from San Francisco for a year's cruise around the world. Mr. Hanchett tendered his resignation some time ago, but the Boston directorate prevailed upon him to remain until the transfer of the properties to Utah Copper interests could be made. As a reward for his faithfulness to the Boston Consolidated, the directors have voted him a salary of $25,000 for the next twelve months. Overtures have been made to Louis S. Cates, mine manager, and A. J. Bettles, metallurgical engineer, of the Boston Consolidated, to remain in the employ of the Utah Copper Co., but it is understood that each of them may decide to retire. Aside from the changes in the staff of the two companies, Mr. Jackling says that the capacity of the Boston mill is to be increased from 3000 to 5000 tons. The original plans for the present Boston mill called for a capacity of 2500 tons per day, and after completion it was learned that 3000 tons of ore could be reduced in the plant. The Utah Copper mill is also to have its capacity raised from 6000 to 10,000 tons. These two plants, with the one at Copperton, will give the company a milling capacity of 17,000 tons of ore per day, while in case of a large advance in the market price of copper, the management could increase the capacity 50%, by cutting down the extraction.

On or before February 15 it is generally conceded that a majority of the shareholders of the Nevada Consolidated will surrender their stock in exchange for shares of Utah Copper at the rate of 2¼ shares of Nevada for 1 of Utah. While a number of the shareholders of the Nevada Consolidated are opposed to this merger, one who is in a position to know says that the Guggenheims are the best posted on the intrinsic value of the two properties, and since the Boston Consolidated has been acquired by the Utah Copper, the latter company has one of the most valuable copper-bearing estates that has ever been developed in the low-grade porphyry deposits of the West. Utah Copper and Boston Consolidated have their work several years in advance of the Nevada Consolidated, and it appears to be the impression among local mining engineers that the Nevada Consolidated has reached a point in its development which will result in its pit-work being more expensive than during the earlier stages of development. As the steam-shovels in the pit extend the opening into the mountain the overburden is becoming thicker, and the copper content at the greatest depth in the first pit is not as high as nearer the surface. Still another consideration in favor of forming the merger is said to be the fact that the Guggenheims realized that the capable management of D. C. Jackling and his efficient corps of engineers is perhaps without equal in the country. Mr. Jackling is credited with having added many new methods to metallurgy as a result of his experience in the mining and treatment of low-grade ores. He constructed some of the largest gold cyaniding mills in the West, operated smelting plants in Colorado, and is a practical and theoretical man in mining in all its departments.

During a recent visit of W. A. Clark to Salt Lake City, he stated that there would be no gigantic merger of all the copper producing properties in this country. He took the position that the interests were so diversified that it would be impossible to get them to enter into an agreement for the control of the copper output, and the price of the metal in the open market. He said that the copper producers were getting along fairly well, and that he personally would oppose any movement which has a tendency to put the red metal on a speculative basis.

The Ohio Copper company has started the second section of its mill at Lark. This places the first half of the mill in operation, but owing to delays in the delivery of tables and equipment for the remaining portion of the plant, it will be several months before the management will be able to have the entire mill running. The Ohio has always been in need of money with which to complete its development and mill construction, but since the recent visit of F. Augustus Heinze, it is believed that arrangements will be made to complete the financing of the company at an early date. Incidental to starting this mill there has been a number of vexatious delays. The manager, Colin McIntosh, thinks that he will experience less trouble in future, yet the profits must come from handling more than 1000 tons of ore per day. George W. Lambourne, manager for the Daly Judge Mining Co., announces that he has closed bids for driving the long tunnel from the Snake creek side of the Park City district, to tap the Daly Judge and drain it at great depth. Repeated efforts have been made to get the Ontario drainage tunnel extended from the Daly West ground, but the Daly West owners will not consent. Thus the Daly Judge has decided to drive its own tunnel, and will get the assistance of mining property owners in that vicinity. The tunnel will be driven several thousand feet, and will drain a large area in the Bonanza Flat section of Park City district. It will take at least a year to complete this work as planned.

KALGOORLIE, WESTERN AUSTRALIA.

Strikes and Coal Output.—October Gold Production. — Perseverance Fire.—Municipal Electric Plant.

We have had another strike of firewood employees, but it has been settled to the evident satisfaction of all concerned. This time none of the mines closed, but their fuel reserves were almost depleted. A serious strike of coal miners is now in progress in all the collieries in New South Wales, the real grievances being rather obscure. The strike will not affect western Australia, excepting that it increases the production of our Collie coal mines in the southwest. These produce 175,248 tons, valued at $2 per ton in 1908, and the output is steadily increasing. The western Australian railroads use a mixture of Newcastle (N. S. W.), and Collie coals. The local coal will not stand much handling and exposure to the weather, but it appears to be improving of late. The percentage of fixed carbon runs from 45 to 50%. Our mines use very little, but steamers calling in at Fremantle take in increasing quantities; and now that the strike is on, the production is bound to rise.

The Golden Link ore reserves now stand at 71,000 tons worth $8.50 per ton. In announcing the reserves of the Kalgurli as 430,000 tons, worth $13.70 per ton, the manager states that development is somewhat behind extraction. Work at 1450 and 1550 ft. has not opened up as much as was expected, while little has been done at 1650 ft. Ordinarly, two new levels per annum are sufficient to keep well ahead of the mill, which treats 10,700 tons monthly. The orebodies in this mine are wide with little length. A new engine is being erected, capable of hoisting from about 300 ft. The Oroya-Brownhill is to further reduce its yield,

which at present is $80,000 from the mines, and $20,000 from residue treatment monthly. It is fairly certain that this mine will not operate much longer. Some years ago the monthly returns were valued at $270,000. The principal October returns were as follows:

Name.	Tonnage.	Value.	Profit.	Dividend.
Associated	11,505	$105,000	$ 30,000	.....
Associated Northern Blks	3,734	25,000	6,500	.....
Chaffers	3,310	32,000	8,500	.....
Golden Horseshoe	25,006	244,000	100,000	.....
Golden Ridge	2,235	28,000	14,000	.....
Gt. Boulder Proprietary	18,792	250,000	135,000	.....
Gt. Boulder Perseverance	19,016	135,000	21,000	.....
Great Fingall	10,863	74,000	9,000	.....
Hainault	5,600	39,000	7,500	.....
Ivanhoe	19,677	204,000	100,000	$250,000
Kalgurli	9,650*	125,000	65,000	185,000
Lake View Consols	11,328	65,000	12,500	.....
Oroya-Brownhill	11,666	104,000	40,000	110,000
Oroya-Black Range	4,591	56,000	22,000	.....
Sons of Gwalia	13,610	113,000	44,000	.....
Sons of Gwalia South	2,134	21,000	2,500‡	.....
South Kalgurli	9,040	62,000	7,500†	.....

*About 1000 tons short through accident to mill engine. Balance of the plant is motor driven. †About $5000 of usual profit spent on plant for sluicing away residue, instead of conveyor belts. ‡Shut down indefinitely. Development behind the mill.

There will be no output from the Perseverance mine for the next six months at least. On the tenth of the month, a perfectly calm day with the mercury just over 90°F., fire was discovered about 2 p. m. in the engine-room. Streams of water were playing on the fire in a couple of minutes but the flooring and woodwork being saturated with ten years' of oil, the fire got such hold that in ten minutes the whole place was a furnace. It seemed as if the entire mill were doomed to destruction and it would have gone if any wind had sprung up as it did five hours later when the temperature dropped to 57°F. Tremendous efforts were made with lines of hoses from neighboring mines, the Kalgoorlie and Boulder City, and by the fire brigades' steamer engines. There was great risk of an explosion from the 10 Heine water-tube boilers, but the fires were drawn and the steam main was broken soon after by falling timbers. By 4 p. m. the fire was under control, as when it got to the roaster shed there was not much to burn, and the part destroyed had seven streams of water playing on it. The machinery wrecked included a horizontal compound-condensing Corliss engine of 450 hp., built by the E. P. Allis Co., with cylinders 20 and 36 in. by 48 in. stroke running at 77 rev. per minute. This was used for driving 18 Griffin mills, screw-conveyors, main belt-conveyor for broken ore, and a 150 kw. continuous current generator. The engine drove a main shafting by a 3-ply leather belt 115 ft. by 42 in., weighing 1500 lb., and costing $1000, and purchased from Ludovici & Co., of Sydney. This caught fire and helped to spread the flames. A Brush compound-condensing vertical engine driving direct at 240 rev. per minute, a 200 kw. continuous current generator was also lost, as were two Wheeler condensers handling 13,500 lb. of steam per hour, a Holden & Brooks oil separator and two compound-condensing Ingersoll-Rand air-compressors, with Corliss gear, delivering air at 90 lb. pressure to the mine and mill. One engine had a load of 350 hp. and the other 200 hp. Each compressor had an inter-cooler which were also destroyed, as were three lines of shafting, belting, ore-bins, and 16 Griffin mills with their attachments. The total damage was over $250,000. This mill was erected in 1899 by Messrs. Nichols and Blakesley, of the United States, and its cost to date has been about $850,000. It embodied the dry-crushing and roasting process; the ore being milled in 16 Griffin mills, roasted in 6 Perseverance furnaces—a combination of the Holtoff-Wethey and Edwards makes—ground to slime in fourteen 8-ft. pans, agitated with KCN in 24 agitators of the ordinary type, and finally treated in 11 presses of 5-ton capacity each. In 1908, 204,406 tons were treated for $1,520,000. Dividends totaled $340,000. Costs were: mining, $1.54; treatment, $2.82; general, $0.31 per ton. Dividends to date amount to $7,000,000. The mine is opened to 1900 ft. on three lodes. Development in 1908 totaled 7699 ft. Broken ore in stopes was 85,187 tons, while the ore reserves were 391,947 tons, worth $6.60 per ton, down to 1100 ft. Employment was given to 660 men. This is the most disastrous fire that has taken place in this district. Some 12 years ago a 40-head mill, some 12 miles from here was burnt down, and three years ago the Golden link of 20 stamps was struck by lightning and totally destroyed. The insurance on the Perseverance mill was $460,000.

During the financial year of the Kalgoorlie Municipal Electric Lighting plant, 1,122,083 units were generated and 865,043 sold to private consumers for $92,500, the profit being $44,300. The average receipts per unit were 10.8c., and costs, 5.8c. The plant consists of two Parsons turbo-generators and three high-speed engines driving dynamos direct; also four Babcock boilers generating steam at 180-lb. pressure. The municipality here runs the lighting, markets, baths, theatre, recreation reserves, and the like, with good results. The Boulder City lighting plant generates some 600,000 units annually and the Power Conporation over 11,000,000 units. Adding these quantitles to that generated on the mines we get a total hard to equal in any mining centre of this size.

LONDON.

Definition of Mineral.—Stream Tin. — Dolcoath Shaft. — Climate of Cornwall.—West Kitty and the National Minerals Corporation.

I have referred in this column several times during the last year or so to the numerous law suits hingeing on the meaning of the word 'mineral'. Nearly all these cases have been carried through all the courts up to the House of Lords. In the old days a 'mineral' was a substance that was 'mined', and it was, therefore, assumed that the operation of winning would not interfere with anything built or worked on the surface. Recently clay and sandstone, worked by pits or quarries, have been the subjects of contention, and various contradictory judgments have been given. A month ago the House of Lords delivered an important judgment in which they laid down the law that common surface rock and clay could not be classed as minerals. This week another judgment has been given which helps to further elucidate the views and attitude of the judiciary of the House of Lords. This was the celebrated Cornish china-clay case where the owner of the mineral rights, Lord Clifden, and the lessees, the Carpalla China Clay Co., resisted the contention of the Great Western Railway, the owner of the surface rights, that china-clay was not a mineral but only a decomposed part of the surface rock. The High Court and the Court of Appeals had held that under the Railway Act of 1845 china-clay was undoubtedly a mineral. The House of Lords unanimously supported the lower courts and added further comment. They agreed that the clay was a decomposed surface rock, but seeing that it was rare and of special value, it did not come within the scope of the decision regarding sandstone and ordinary clay. From the point of view of it not being 'mined' and therefore not a mineral, they found that it could not be advantageously worked and dressed in any way except by open-cut, so that the owners must be given the right to work it on the surface. When the Great Western Railway raised the point last year, most people hardly understood the logic of their contention, for since 1845 it has been the custom to consider china-clay a mineral in law, and custom and usage are not things to be lightly set aside.

Your readers are probably more or less familiar with the slime-tin problem in Cornwall, how so much of this tin is lost in the dressing works at the mines and discharged with the tailing into the Red river. The slime of this river is worked over and over again by various 'streamers' who, with their cheap automatic 'rag frames' or 'dead frames', all manage to pick up a decent sort of living. Dolcoath, South Crofty, Carn Brea, and others all discharge their tailing in this way, and probably from one-third to one-quarter of the contents of the ore is lost to the mines. None of the companies admit their losses and there is no

way of finding out which mine loses the most. The managers, with one exception, never make accurate assays of anything, but prefer the old vanning shovel. Recently J. J. Beringer, head of Camborne Mining School, and author of the text-book on assaying, has been making special efforts to introduce accurate methods of ascertaining the tin content of the ore, tailing, and concentrate, and H. W. Hutchin, the assayer at South Crofty, the exception mentioned above, has conducted much experimental work on Mr. Beringer's lines. It is, therefore, of particular interest to record that a tin streamer has made the novel move of treating the slime-tailing at South Crofty, before it is mixed with the Red river. His plant is now being erected and will be soon in operation. His work will be an excellent check on the South Crofty dressing plant and should spur Mr. Hutchin to still greater efforts. It is obvious that this new move will have an important influence on the question of tin dressing.

An important event in the history of the new main shaft that has been sunk at Dolcoath, is now to be chronicled, namely, the connection has been made at the 440-fathom level with the present workings. The atmosphere of the mine has been wonderfully improved by the ventilation afforded by the new shaft. The flowing current of air is pleasant to work in, compared with the warm, moist, stagnant atmosphere hitherto typical of the mine. By the way, the climate of Cornwall above ground is never, at the best of times, very invigorating, and in the winter time the damp and the mists are depressing and enervating. A Cornish miner is always more active abroad than at home. The indolence of the Cornishman is noticeable among the fishermen, for they prefer to let their women folk mend their nets and do the other work on shore. I have seen them at Newlyn on Sundays waiting for the public houses or saloons to open at 1 o'clock, leaning gracefully on posts or supporting the house walls. There was no dash when the clock struck one. Even the attractions of the saloon did not induce them to abandon their comfortable attitudes until another ten minutes or a quarter of an hour had elapsed. This is a reflection not on the people but on the climate. A deal is heard in the papers about the 'Cornish Riviera' as a winter resort. This is merely a dodge of the Great Western Railway to impose on the inexperienced Londoner and induce him to leave his comfortable home for the sunless, misty, muddy tracts of the west country. Of course it is rank heresy to say all this. After John Davidson's death, one of his letters was published in which he forcefully protested against the misrepresentations relating to Cornwall as a health resort; all the comment made by the local papers was that the utterance of such a sentiment was proof of the poor poet's madness.

The West Kitty mine, in the St. Agnes district of Cornwall, has gone through many vicissitudes lately, owing chiefly to disagreement among the various sets of shareholders. During the last few days it has been handed over to new control, and, as far as its prospects for actual mining work are concerned, I should fancy that the last state is worse than the first. The control is now held by a group of foreign promoters called the National Minerals Corporation. These were the first outsiders to take up Cornish mines a few years ago. Their first venture was at Clitters in East Cornwall, where modern plant and method of development were to show how things should be done. Unfortunately the plant was ahead of the development, and the mine is not a large producer. A still more unfortunate act was the declaring of an interim dividend that had not been earned, so at the end of the year additional capital had to be raised. This incident marked the end of the group's control of this mine. In the meantime they had acquired the old Wheal Jane mine, near Chacewater, and a company called the Falmouth Consolidated was formed to work it. An expensive plant was erected before any substantial development had been done. When the plant started, blame was thrown on the ball-mills, which, by the way, are working successfully enough on tin and wolfram ores elsewhere. The ball-mills were turned out and stamps are being erected instead, but so far, there has been no production of tin. The next move has been to acquire mines at St. Ives containing tin and uranium, and the chief event so far in connection with this venture has been the erection of a laboratory in London where Sir William Ramsay is to try to extract some radium. Now comes the news that they have acquired West Kitty, and that they are endeavoring to obtain other leases in St. Agnes. All these years, the amount of talking in London has been prodigious and the stock market has been industriously worked. The question is, what good is all this to Cornwall or to legitimate mining?

BUTTE, MONTANA.

December Output. — Clark's Attitude Toward a Copper Combine. — Butte-Ballaklava.—Butte & Superior.—Davis-Daly.

The December copper production by the Butte companies fell below preliminary estimates, the total being but 14,340,480 lb., against 27,889,140 in November. The heavy decrease was due to the strike of railroad switchmen, which continued through the month and prevented the transportation of ore from many mines and shut off the supply of coal. The total output of ore and production of copper, in pounds, was as follows:

Companies.	Ore, Tons.	Copper, Pounds.
Anaconda	98,000	5,978,000
Washoe	5,600	336,000
Parrot	3,360	194,880
Trenton	8,400	512,400
North Butte	33,600	2,049,600
Butte Coalition	39,200	2,548,000
Original	16,800	1,108,800
East Butte (Pittsmont)	8,400	520,800
Miscellaneous	16,800	1,092,000
Totals	230,160	14,340,480

The attitude of W. A. Clark toward the proposed copper merger appears to have undergone a change. It was surmised that his apparent opposition was induced by a controversy with the Amalgamated company. If that was true, then there must have been an adjustment of the controversy, for he is now impressed with the feasibility and necessity of a combination of producers. He says the proposed merger is not a merger in the popular sense of a trust, and does not contemplate discrimination; that it will not affect the mines of Arizona, where his famous United Verde is situated, nor the mines of northern Michigan. It simply means, he says, that three or four of the larger copper interests will get together on a basis where they can handle their product better. "There is a world-wide over-production of copper that will have to be worked off," says Mr. Clark, "but new uses to which the metal is being put are increasing. It is impossible to mine copper with a fair profit under 15c. The price should not, however, go above that." The statement of Mr. Clark that there is no reasonable profit in copper under 15c. is significant, as he is the largest individual producer of that metal in the world.

The shaft of the Butte-Ballaklava Copper Co. has been completed to the surface, and is now a standard 3-compartment shaft down to the 1400-ft. level. Down to 500 the shaft was only 2-compartment, but another compartment has been raised to the surface. The foundation for the new hoisting engine has been completed and new machinery will be installed. Meanwhile the company is mining and doing extensive development. Several hundred tons of ore are being shipped daily, and when the new hoist is installed the output will be increased to at least 500 tons per day. The Butte-Ballaklava has opened four large veins and has much high-grade ore blocked.

The Butte Superior Copper Co. has begun shipments of zinc ore to the concentrator of the Basin Reduction Co. A railroad spur is also being built to the mine, and when completed shipments will be increased. However, at present the mine is not in good shape for a large production. The ore yields only zinc and silver. So far as copper is concerned results have been disappointing. The

Butte & Superior has acquired control of the Butte-Milwaukee and Butte-New York companies, owners of the Colonel Sellers group of claims, and has excellent prospects of adding a copper producer to its list of properties. It is now officially announced that the deal has been completed and that A. B. Wolvin and Theodore Hollister, of Duluth, are Butte & Superior representatives on the Butte-Milwaukee board. The Butte & Superior has started the cross-cut from the 1600-ft. level of the Black Rock mine to connect with the Colonel Sellers shaft at a depth of 1700 ft. on the latter property. The Colonel Sellers shaft is 630 ft. deep, and connection by raises will be made from the Black Rock cross-cut.

The Davis-Daly Copper company is not shipping ore at present, confining its work to development in the Colorado mine. As soon as the company can get a franchise from the city of Butte to build an electric tramway from the mine to the Great Northern railway, preparations will be made to resume shipping to the Basin concentrator. The shaft of the Colorado is now down 1850 ft. No more sinking will be done at present.

NEW YORK.

Copper Merger. — Nevada Consolidated and Ely Central. — Granby Consolidated. — Metal Market. — Guanajuato Development. — Santa Gertrudis.

While the interest in copper, both in the metal and in the share market, absorbs by far the major part of the public attention, the talk of a gigantic combination has largely died away. One of the big copper producers said today, that from data which he had recently been gathering he believed there was a heavier demand for copper now than at any previous period in history. There is no doubt that domestic consumers are beginning to buy for some months ahead much more generally than they have done at any time during the past year. A 14c. market may be counted as fairly well established, and with the export demand continuing strong and active, 15c. may be safely prophesied for both Lake and electrolytic copper. The shutdown of the mines at Butte, coupled with the curtailment which was attempted generally by the larger copper mines, is of no little aid in firmly fixing higher price-levels for copper. It seems to be generally accepted that Nevada Consolidated is not to be taken into the Utah Copper merger, but I am advised by cable today that, at the meeting of the shareholders of the Boston Consolidated, held in London, the shareholders of the latter company voted to ratify the consolidation with Utah Copper on the basis of two and one-half shares of Boston to one of Utah.

Regarding the Cole-Ryan group, it is now stated that a new plan has been arranged, contemplating the formation of a company which will buy the Cole-Ryan properties and the mines of the Amalgamated Copper Co. outright. Nothing definite has been done, further than to consider the purchase of the larger properties of the Amalgamated, which, if the deal is consummated, will be paid for in stock so far as the Amalgamated interest is concerned, thus wiping out the old companies and giving Amalgamated a controlling interest in the new organization. As outlined, the terms of the transfer will include the alternative of stock or cash in payment for the properties of the operating companies, so as to obviate the objections of any minority shareholders.

The situation at Ely seems to be somewhat complicated, and a merger of some of the larger companies with minor developing concerns is mentioned. I was told today that James Phillips, Jr., of the Nevada Consolidated, has asked for a figure to be given him on 850,000 shares of Ely Central. The trade by which Ely Central is to be acquired is part of a larger deal, which contemplates a fusion of the friends of Mr. Phillips in the Nevada Consolidated with the Cole-Ryan interests and the purchase by the new allied forces of the Guggenheim holdings in Nevada Consolidated at a price said to be $40 per share. This move, if completed, will make Ely decidedly a Cole-Ryan camp, as the International Smelting & Refining Co. would undoubtedly take over the big reduction works at Steptoe. A diplomatic denial of any such contemplated deal was issued by Mr. Phillips' office, but it is quite apparent that some such shifting of interests is contemplated. Inasmuch as Mr. Phillips and his friends seem to have been able to dominate the Nevada Consolidated to the extent of blocking the absorption by Utah Copper, it is but natural that, for the sake of harmony, the Guggenheims should prefer to get out.

The Granby Consolidated Mining & Smelting Co., Ltd., is issuing 13,500 shares of capital stock heretofore held in the treasury. Stockholders are given the right to subscribe at $85 to the extent of 10% of their present holdings. The issue is made on account of heavy expenditures on the Granby property, and the company's Crowsnest Pass Coal property. In the share market the issues in which the General Development Co. and Adolf Lewisohn and his friends have a controlling interest, have been pre-eminently the leaders. Miami, Ray Central, Keystone, British Columbia, among the coppers, and Kerr Lake among the cobalts, have all been active and have scored marked advances. Braden Copper shares and bonds have been listed upon the London stock exchange and the securities are to be distributed upon the market there.

E. G. Hothorn, of the firm of L. Vogelstein & Co., American representatives of Aaron Hirsch & Sohn of Germany, leading metal dealers and brokers, in New York City, takes an optimistic view of the metal market for 1910. The heavy export demand for copper in December and a general return to activity among domestic consumers shows that consumption is creeping up on production and that a very encouraging showing may be expected when the figures of the Copper Producer's Association appear. Viewed as a whole, Mr. Hothorn says the market is in a clean and healthful condition, and a greatly increased demand with higher prices ruling may be expected in 1910. He also says that one effect of the enforcement of the new pure food law has been greatly to increase the consumption of pure white lead, and thereby has been created an enlarged demand for lead bullion, which enjoys just at present a strong market. The American consumption of tin is much greater just now than ever before in the history of the market, and prices are higher on a steadily increasing demand. Production of spelter continues to run about 10% ahead of consumption, but the outlook is good, and the accumulated stocks have been practically all absorbed.

It is stated that the Consolidated Arizona Smelting Co., which controls the old smelter at Humboldt, Arizona, has made a contract with the United Verde to handle some of the ores from W. A. Clark's mine. It is doubted whether the report is correct, but it carried sufficient weight to cause a considerable advance in the smelting company's shares.

The Proprietary Mines Co. of America has been advised by wire from Guanajuato that a rich strike has been made in the face of the Nopal vein of the Nueva Luz mine on the 300-ft. level, the ore running 60 kilograms of silver per ton. The Guanajuato Consolidated Mining & Milling Co. reports a gross production for the month of November of ₱115,500, less working expenses, ₱80,900; net ₱34,600, of which ₱10,100 was expended in development.

Among the metals lead and zinc ores have been ruling slightly lower, zinc sulphides averaging $47 to $49 per ton for 60% ores; zinc silicates averaging 40% zinc, bringing $26 to $28 per ton. Average price for lead last week was about $56 for 80% ores.

The shareholders of the Camp Bird, Ltd., have voted unanimously to accept the proposition to take over the Santa Gertrúdis y Guadalupe. The resolution adopted by the shareholders is, that the company authorize the formation of a separate company to acquire the option over the Santa Gertrúdis, and that the capital of the company be increased to £1,350,000 by the creation of 250,000 additional shares of £1 each. Camp Bird's present capital stock is 1,100,000 shares, of which 820,000 have been issued. This gives the company a present treasury reserve of 280,000 shares, which, with the authorized increase, will make available 530,000 shares of treasury stock, which will presumably be offered to the shareholders at something better than par, and a little under the present market.

General Mining News.

ARIZONA.

COCHISE COUNTY.

The hoist at the Peacock Copper Co.'s mine at Johnson has been installed. A carload of lumber for the mine buildings has been shipped to the company and two carloads of ore are on the dump for shipment to the smelter.——Operations are to be resumed at the old Peabody mine which has been idle for the past two years owing to litigation. The property is credited with a production of over $2,000,000 from the upper levels.——The Johnson Copper Development Co. is installing a 40-hp. Fairbanks-Morse gasoline engine and a 10 by 12-in. compressor.

GILA COUNTY.

(Special Correspondence).—As soon as a double-drum hoist can be installed at the No. 4 shaft of the Miami Copper Co.'s property, sinking will be resumed to increase the depth of the shaft from 450 to 700 ft. When production begins all the ore for the concentrator will be hoisted through the No. 4.——The Star churn-drills being used on the Inspiration Copper Co.'s property have put down 23 holes since last spring. This drilling has been done to prospect the ground between the Scorpion and Joe Bush shafts, a distance of 2400 ft.——Sinking will be resumed at once on the McGaw shaft of the Superior & Boston property. This shaft is now at the sixth level and will be the main working shaft of the mine. A 1000-gal. Prescott pump is being installed on the sixth level. The Superior & Boston mine is in a position to ship 100 tons of ore daily were it deemed advisable to begin production immediately.——The Star churn-drill to be used for prospecting the Cordova Copper property has arrived and will be set up for drilling the first hole at the Jennie shaft. The drill will continue the prospecting of this ground from the present depth of 125 ft. at which shaft-sinking has been discontinued. At this depth, the assays were 2% copper. Granite-porphyry is the formation thus far opened by this shaft.——The Duquesne Mining Co. has placed a block of its stock on the local exchange. John F. Shaw, the president, has selected the position for a double-compartment shaft and expects to begin this work as soon as the necessary arrangements can be made. Several shipments of gold ore have been made from this property since development work was started last August. The average gold content was $32 per ton. Indications are favorable for the development of a copper mine at depth.——The churn-drill prospecting on the Boston-Miami property of 42 claims is giving satisfactory results. F. W. Hoar, the superintendent, has 35 men employed.

Globe, January 7.

YAVAPAI COUNTY.

Operations are to be resumed at the old Comet mine in the Walker district, re-christened the Snow Flake. The mine has a good record for ore produced from the upper levels before the sulphide zone was reached. New equipment has been purchased and new buildings are being erected by the Snow Flake Mining Co.——A test shipment of 15 tons of ore and 2 tons of concentrate from the Black Diamond property, in the same district, netted the owner, David Booker, $57 for the ore and $60 for the concentrate. The shaft is down 90 ft. on the vein and the mine is to be equipped with a hoist in the near future.——John Duke purchased the Alta group in the Bradshaw mountains for $10,000.——The shaft at the Money Metals in the Black hills has been unwatered and a cross-cut started from the 200-ft. station.——The claims against the Standard Exploration Co., operating the Treadwell property in the Big Bug district, have been settled, and it is probable that the Treadwell smelter at Mayer will be re-built this spring. David Miller is president of the company.——An 18-in. vein has been opened on the Arizona Copper Belt property at Constellation, and the company is to resume work on the mill next month.

CALIFORNIA.

AMADOR COUNTY.

(Special Correspondence).—The South Eureka is disbursing monthly dividends at the rate of 2c. per share, making a total of $8000. Twenty stamps are in operation, including the ten leased from the Central Eureka. The vein on the 2700-ft. level is said to be 10 ft. wide and is good milling ore.——The hanging wall vein has been cut on the 3300-ft. level of the Kennedy. It is 5 to 6 ft. wide. The 150-ft. west drift is expected to intersect the foot-wall vein within 150 ft. In the mill 100 stamps are dropping steadily.——It is reported that the Bunker Hill expects to add ten stamps to its mill in the spring.——The Garibaldi placers are being operated during the winter.——George Hambric and associates have purchased the Ginocchio claim and have commenced shaft sinking. George Hambric is manager.——Operations have been resumed at the Mitchell. Several men are employed.——The Argonaut, Bunker Hill, Kennedy, and South Eureka are declaring regularly monthly dividends.

Jackson, January 10.

O'Donnel, Weiss & Kristovich who purchased the Dane & Mitchell mine at Pine Grove recently, have taken over the Blakely place of 160 acres. Ten stamps and a cyanide annex are to be added to the mill.

BUTTE COUNTY.

The Butte Magalia Consolidated Mining Co. has purchased the Cohn property near Magalia and is driving an adit to tap the channel. The company now has about 1000 acres along the trend of the channel which will be worked as a drift mine.——The Cohn & Gooday shaft has cut the gravel at a depth of 500 ft. on the incline and will now be sunk on the rim till the bottom of the channel has been reached.——The Mammoth Channel Mining Co. has installed new machinery and is sinking.——The adit at the Magalia Consolidated is now in about 200 ft. and is expected to open the channel within the next fifty.

CALAVERAS COUNTY.

The Boston mine, three miles from Mokelumne Hill has been bonded to Eastern capitalists and will probably be reopened.——Operations have been suspended at the Easy Bird mine.——The Washington mine, near Murphys, is being unwatered by John Campbell.

INYO COUNTY.

The main adit at the Casa Diablo mine cut the Granite Mountain vein recently when in 850 ft. opening a good body of ore which is now being put through the mill. On the level 100 ft. below the adit the drift has cut the shoot on the Dry Bone vein, two assays from samples taken across the face for a width of 10 ft. running $29 and $38 per ton. The drift 100 ft. below this is expected to intersect the ore shortly.——The New Coso Mining Co. has installed a 70-hp. gasoline hoist and is shipping 90 tons of ore per week to the smelters.——The drift on the lowest level of the Four Metals company, operating on Cerro Gordo hill, has opened a good body of galena ore.

KERN COUNTY.

Two new 7-ton engines and twenty-one 3-ton cars have been added to the equipment at the Yellow Aster mine at Randsburg. In the mill 130 stamps are kept dropping, the cost per ton for treatment averaging less than $1.50.

MARIPOSA COUNTY.

A 2-stamp mill is being erected by Joseph Kolbach at his property on Saxon creek.——Operations have been resumed at the Santa Rosa property.——A 100-ft. shaft is to be sunk on the Santa Clara group in the Mariposa district.——J. C. Horsley and James Leonard have secured a bond on the San Jose mine at McCabe's Flat. Considerable rich ore has been taken out of pockets on the property.——J. W. Graham is installing 350 ft. of pipe at the King Solomon mine, near Briceburg, to furnish water power for the 4-stamp mill erected several years ago. Mr. Graham and M. G. Wilson are contemplating the erection of a power-plant on Bear creek to furnish power for the Santa Rita mine and mill.

NEVADA COUNTY.

A drift has been started on the vein at the Sunshine property in the Washington district that, when completed, will give from 500 to 700 ft. of backs. The vein is on a contact between slate and serpentine; the ore averages $10 per ton. Frank Dillon is manager.——At the Red Point mine below Washington the old adit has been cleaned out and some high-grade quartz found.——A new shoot has been opened 300 ft. from the cross-cut adit in the Fairview mine assaying $30 per ton. The ore at this point is 10 ft. wide and cut at a vertical depth of about 500 feet.

PLACER COUNTY.

There are 40 men working at the Crater mine and the management expects to start the mill this month. Both mill and holst are to be operated by electricity.——At the Orpheum 15 men are working and five stamps kept in constant operation.

SHASTA COUNTY.

(Special Correspondence).—Approximately 7000 acres of dredging lands on Clear creek, six miles south of Redding, have been bonded by Lewis Aubury, State Mineralogist, W. P. Hammon, and associates. The bond runs for a year and operations will be commenced at once.——The Mammoth Copper Co. is producing at the rate of over 3,000,000 lb. of blister copper per month. All five furnaces are in operation at Kennett and 1000 men are employed at the mines and plant. The bag-house is expected to be ready for service early in the spring.

Redding, January 10.

The contract for 250 ft. of sinking at the Reid mine is to be finished in a short time and cross-cutting will be started on the new levels. The bottom of the shaft will be 375 ft. below the present workings. An aerial tram to carry the ore across the Sacramento river and an electric hoist is to be erected by James Salee, the owner of the property. ——Another payment amounting to $45,000 has been made on the purchase price of the Milkmaid mine at French Gulch by Erik O. Lindblom, and the French Gulch Mining Co., incorporated by Lindblom & Soderberg. A 12 by 12 Gardiner air-compressor and 10-stamp mill are to be installed at once. The vein in the present workings is 5 ft. wide, and the ore plated $62.50 per ton on the last 20 days' run. J. J. Sheey is now superintendent of the property. ——G. W. Garwood and T. B. Straven have secured a one-year bond on the Sybil mine at French Gulch for $100,000. The bond stipulates that 50% of the value of the ore extracted is to be applied on the purchase price of the mine. ——The Silver Falls Mining Co., operating near Igo, shipped 45 tons of silver ore to the Mammoth smelter at Kennett.

SIERRA COUNTY.

The Ireland group of three claims near the Plumbago mine have been bonded to Fred Clark and the first payment made on the property. The mine has been closed on account of litigation for several years but is credited with a production of $200,000 from the upper levels. There are several veins on the group, one of which has been cut by an 800-ft. adit.——A shipment of 2800 lb. of concentrate to the Selby smelter from the Standard mine netted the operators, Bevins, Frye & Winrod, $2000.——The raise at the White Bear mine opened the channel on the rim and a cross-cut will be driven to tap the bottom of the gravel. A good prospect was obtained from the ground. John Costa is manager.

TRINITY COUNTY.

Reed & Chapman have opened a 12-in. ore-shoot on the lower level of their Lily of the Valley claim on Coffee creek that contains $60 free-milling gold and $400 gold and silver per ton in concentrate.

COLORADO.

CLEAR CREEK COUNTY.

(Special Correspondence).—Enlarged work is to be put under way next week at the Capital mine. During the past month over 4000 tons of mill-ore have been broken. This was during the time the concentrating plant was undergoing repairs. During 1910 on an average of 250 tons of ore per day will be treated. Shipments of smelting ore are also to be started.——The Boston Mining, Milling & Tunnel Co. will put work under way within a couple of weeks at the Kelly adit. The bore is to be driven for 5000 additional feet, making a total of 7800. F. R. Bromley will serve as manager.——The Centennial mine, situated on Leavenworth mountain, is being unwatered. Shipments of smelting ore have been started, the product netting from 2 to 3 oz. gold and from 15 to 20 oz. silver per ton. Work on the new 50-ton mill is to start March 1. D. Kennedy is manager.

Georgetown, January 8.

(Special Correspondence).—The mine of the Tanquay Mining Co. has been taken under lease by H. M. McGrew and the mill is being remodeled.——The Big Horn vein has been intersected by the Cymric adit at a distance of 1300 ft. from the portal, a body of smelting ore having been found that is from 7 to 10 in. wide.——During 1909 there

Cripple Creek District.

was purchased at the Chamberlain-Dillingham sampler 25,080 tons of ore for which $752,400 was paid.

Idaho Springs, January 8.

GARFIELD COUNTY.

(Special Correspondence).—Late reports indicate that the new camp of Goldstone in this county is proving as rich as was indicated by the rich float that was first found. Considerable work has been done on the Gray Eagle property, operated by the Western Investment Co., showing the vein to be over 2 ft. wide and to average $30 gold per ton. All the work on this property has been in granite and schist which are the predominating rocks in the district.

Denver, January 10.

GILPIN COUNTY.

(Special Correspondence).—E. Visintine & Co., leasing on the 150-ft. level of the Puzzle mine, shipped a lot of ore last week that milled 6.34 oz. gold and 6.34 oz. silver per ton, with 6.75% in copper. Stoping is in progress on a 3-ft. orebody.——An important discovery was made at the Topeka mine, in Russell district, a body of high-grade ore being found 100 ft. above the seventh level that is from 6 to 10 in. wide. H. P. Lowe is manager.——The Pine Comb property, in the Wide Awake district, has been secured under bond and lease by Eugene Shoush, representing Missouri capitalists.

Central City, January 7.

JEFFERSON COUNTY.

The North American Smelter & Mines Co. has secured the services of George G. Vivian, formerly manager of the Knight smelters, to manage the plant at Golden. Additional machinery has been ordered and a furnace of Mr. Vivian's design will be installed.

TELLER COUNTY.

S. H. Guyot and associates, of Boston, have secured a lease on the property of the Chesapeake Mining Co., on Battle mountain, and will install new machinery at the mine. Two shafts have been sunk to a depth of 100 and 210 ft., respectively, on the property and it is the intention of the lessees to deepen these at once and commence shipping ore, a commercial grade having already been opened.——The December dividend of Stratton's Independence amounted to $62,000.——The Dante Gold Mining Co. has determined to work the upper levels of its property by the leasing system, and has granted leases on several blocks.——The Portland and Strong Gold Mining companies have come to an agreement over the apex rights on the Black Diamond claim, thereby avoiding costly litigation. By a previous agreement, formed in 1906, the Portland company was to receive the right to work all veins dipping north and the Strong company all veins dipping south of the compromise line, while the last agreement provides that the Portland operators take all veins dipping east and the Strong people all dipping west of the north and south line dividing the Strong property from the Black Diamond claim. It also established a division of the ore already taken out.——Three companies, operating in the Cripple Creek district, have declared dividends for January; Portland, $60,000, Victor Consolidated, $45,000, and Pharmacist, $7500.

IDAHO.

BLAINE COUNTY.

(Special Correspondence).—The Eureka Development Co., Ltd., operating at Bullion, seven miles west from Hailey, will install new boilers, air-compressor, and hoisting engine, retimber the shaft, and overhaul the concentrating mill, all of which will require the expenditure of $50,000. In 1909 about 300 tons of ore was shipped that sampled 45% lead and 55 oz. silver per ton. W. A. Wilson, of Salt Lake, is manager.——The Red Elephant, belonging to the Quincy Mining Co., underwent some development during the past year, with J. G. Sawyer in charge. It is equipped with an air-compressor and has attained considerable depth by adits.——The Croesus is under lease to Riggs & Scobel. ——The Nayaug, which is a zinc-lead property, has a shoot of pay-ore on its lower levels, and will be operated this year, with John Thomas in charge.——The Idaho Consolidated at Bellevue operated the old Minnie Moore and adjoining properties part of last year, treating the ore by both the wet and dry concentrating processes in the two mills. The lower workings in these mines have been unwatered and production on a larger scale will be accomplished in 1910. Under the management of I. E. Rockwell this property has been well equipped, the latest addition consisting of a hydro-electric power-plant on Wood river, from which power is derived for operating hoists, air-compressors, pumps, and the two mills.

Hailey, January 10.

LEMHI COUNTY.

(Special Correspondence).—The Kittie Burton mine at Ulysses, managed by R. L. Edwards, produced between $90,000 and $100,000 in 1909 in gold bullion besides considerable concentrate which will not be shipped until the Salmon River railroad is finished to that district. The 15-stamp mill is equipped with plates and tables.——The Musgrove mine, on Musgrove creek, 30 miles from Salmon, will be equipped with a mill and cyanide plant this year. The fissure vein in a slate formation is opened by adit-levels on the vein, the ore being a gold-bearing quartz. The driving of a 900-ft. cross-cut that will give 1000-ft. depth on the vein is planned for 1910. Brown & Edwards, of Salt Lake, are directing operations.

Ulysses, January 8.

KANSAS.

CHEROKEE COUNTY.

(Special Corresponoence).—A large underground channel about 25 ft. high and 300 ft. long has been penetrated again on the Hubbard land at Badger. In it is found a floor of soft limestone and dolomite sand, where large chunks of zinc ore, weighing several hundred pounds, have been discovered. Drifts are being driven in different directions from this open channel. The mill-shaft has been supplying ore from the more shallow levels, but the lower runs are being opened in other shafts. The mill has recently been improved with new machinery.——Ore has been found on the Foster land at Galena at the depth of 60 ft. Drill prospecting will be continued though development will also he pushed.——The old Cyclone tract, once a famous galena producer, is again the scene of a discovery at 75 ft. The find in every respect resembles the old workings, the ore consisting of very large chunks of free high-grade zinc blende. The find was made in an old shaft which was retimbered and sunk deeper.——A discovery has been made on the Smith land at Cave Springs by Bob Sloan and associates at a depth of 75 ft. Both lead and zinc are found. Hand-jigs have been installed and the ore will be treated on these until it is learned whether the extent of ore will warrant the building of a mill.——The Nymo company, formerly the Waterhouse, is now operating the new mill, supplying it with ore from three shafts. The shafts are 60, 70, and 80 ft. deep respectively, but the shallower two will be sunk deeper. Underlying the pocket-ore there has been found a run of disseminated mineral similar to other properties in the camp.

Galena, January 8.

MISSOURI.

JASPER COUNTY.

(Special Correspondence).—Among the recent good discoveries, one in the Billy Sunday mine, northeast of Joplin, may be mentioned where a good body of zinc blende was found in several holes from 69 to 83 ft.——A large face of ore is being developed on the Gregg land in Tanyard Hollow where ore was found in three holes at 65 ft.——A Joplin company is developing the Rob Roy land where ore was cut at intervals from 50 to 110 ft., the ore in places running as high as 17%. Zinc blende predominates.——A new discovery on the Gussie K. lease, at Duenweg, has opened both galena and blende at 144 ft.——The owners of the Yellow Dog mine have started operations in half of the 1000-ton mill after a shut-down lasting since the beginning of the panic. W. O. Coats, former superintendent, is manager. The Little Pearl company has started its mill on the Continental ground west of Joplin, the ore being furnished from three shafts.——The Second National mine, at Alba, is ready for work again after being drained. This mine has a 150-ton mill which has recently been overhauled.——Among the important deals closed the past fortnight, the largest, perhaps, is the sale of a lease on the Taylor & Glover land, west of Joplin, to Nixon & Burlingame, of Ohio, the land bringing $50,000. A shaft is in ore and a general deposit found in 15 drill-holes. Work will begin immediately on a 300-ton mill, to be fitted throughout with electrical equipment. During its erection the ground will be thoroughly opened.

NEWTON COUNTY.

(Special Correspondence).—In the Granby camp the Lady Bird Co. has taken over leases on the Bill Miller and Old Timer leases and will develop them at once. A shaft is being sunk on the Miller ground and a mill will be started shortly.——In the vicinity south of Scotland in the northern part of the county, two tracts of land which have hitherto been unprospected, are being found to be well mineralized. The Shifferdecker 400-acre farm is being developed and a shaft is going down upon a drill-hole which drilled into ore at 100 ft. continuing more than 20 ft. A number of holes cut similar runs.——On the Granby land, near by, Crossman & Bucher have found ore in a drill-hole from 88 to 99 ft. Other holes will be sunk before a shaft is started.——In the Spring City camp Frank Malang and others are developing a tract of the Allen land in the north-

ern part of the camp and are now sinking the fifth shaft, having four in ore at 100 ft. The ore is mainly zinc blende though good lead is being penetrated at shallower levels in the fifth shaft. There are several large dump-piles awaiting treatment but no ore has been cleaned as the company is to erect a large mill. The best part of the ore shows a 14-ft. face.

Granby, January 8.

NEVADA.

CLARK COUNTY.

The quarterly report of the Quartette Mining Co., at Searchlight, shows that the company has been producing at the approximate rate of $1000 per day.——A lot of 46 tons of ore from the Chief of the Hills lease at Searchlight was put through the Cyrus Noble mill resulting in a $2500 gold bar. The lessees have about 75 tons now ready for the mill and will start an adit farther down the hill to open the ore at greater depth.——The east drift on the 50-ft. level of the Sunday group opened a shoot of $50 ore. The vein is about 4 ft. wide, but the ore is only 1 ft. in width. ——A whim has been set up at the Duplex Extension shaft and sinking resumed at the depth of 90 ft.——The drift on the third level of the New Year's Gift lease opened 30 in. of ore that assays $40 gold, with a small amount of copper. A stope will be started and the ore shipped to the smelter.

ESMERALDA COUNTY.

The new Chilean mills and concentrators recently installed in the Consolidated mill are in operation, and the management hopes to break all records with this month's production. The Clermont vein is supplying a large amount of ore for the mill, and it is expected that this source will be increased shortly when the west cross-cut on the 1000-ft. level opens this vein.——The shaft of the Goldfield Annex on the Polverde claim cut a body of low-grade quartz at a depth of 750 ft. The management hopes to open the Clermont vein at about the 900-ft. level.——Lessees on the Gold Bar have cleaned out the old workings and succeeded in opening a new shoot, the ore from which is being shipped to the Nevada Goldfield Reduction Works.——The Grizzly Bear shaft is down 800 ft., the Big Florence lease, on Atlanta 730, the shaft of the Merger Mines Co., is being unwatered to continue sinking to the 600-ft. level, and the tendancy of the whole district is to explore the ground at greater depth.

LANDER COUNTY.

(Special Correspondence).—The Austin Manhattan Co. is arranging to install a 60-hp. gasoline hoist at the Ophir shaft and will sink to greater depth.——Driving on the Panamint vein from the 800-ft. level of the Lander Hill shaft is opening good ore and the drifts on the 200-ft. level of Jackpot have cut a shoot assaying $60 per ton gold, with a high silver content. On the Patriot good ore is being stoped in the recently unwatered levels. The Maricopa Leasing Co. is developing the Patriot under lease from the Austin Manhattan. New machinery will be installed shortly. ——The cross-cut adit at the Austin Nevada has been reopened for 550 ft. and exposes five distinct veins.——The Peerless lessees report the uncovering of a 12-in. shoot of $500 ore on the foot-wall of the main 4-ft. vein.——The Shoshone Quicksilver Co. is opening several veins of high-grade cinnabar. A furnace will be installed this spring.—— C. J. Kinchel and associates of Oakland, California, have bonded a group of claims adjoining the King Midas. Drifts will be driven to cut the main vein.——The Murray lease on the Valley View claim of the Nevada-Omaha estate, has opened 18 in. of ore assaying $70 gold per ton.——The Hanks lease on the Buzzard reports 12 in. of ore assaying $250 gold per ton.——The Bannock Mining & Leasing Co. has opened a new vein from 4 to 6 ft. wide. The small vein of high-grade ore in the shaft is holding out with increasing depth.

Austin, January 6.

LYON COUNTY.

The first train over the Mason Valley railroad reached Yerington January 14, and is expected to be in Mason City before the end of the month.

NYE COUNTY.

The east drift on the 1100-ft. level of the Tonopah Belmont has been extended for 60 ft. along the shoot proving it to be 8 ft. wide and have an average assay of $60 per ton.——The record for development work at the Tonopah Mining Co. was broken the first week of the year with a total of 618 ft.——The cross-cut in the hanging wall on the 390-ft. level of the Montana Tonopah mine opened 3 ft. of good milling quartz.——The December production of the Round Mountain Mining Co. amounted to $35,000. The threatened litigation between the Round Mountain company and the Round Mountain Red Top has been avoided by the former company taking over the latter's property and issuing the stockholders 60,000 shares of Round Mountain stock.

General View of Goldfield.

WHITE PINE COUNTY.

The Steptoe Valley Smelting & Mining Co. is installing a new Nordberg blower in the new unit of the plant as a reserve in case of damage to the present air supply. The new machinery will be erected at a cost of approximately $75,000.——At the Ely Central the Clipper shaft is in ore and the Eureka shaft is expected to enter the copper-bearing porphyry within the next 40 or 50 ft.——The Emma shaft of the Boston Ely is now down 1110 ft., and has been in ore assaying from 1 to 3% copper with 60c. to $2 gold per ton for the last 45 ft. A drift will be run on the 1150-ft. level to the jasperoid at which point the management expects to open good commercial ore.——The raise at the Giroux broke through to the surface January 6, after six months' continuous work. The shaft is the largest in the district, being of five compartments, and sinking will be started at once to reach the 1200-ft. level.

OREGON.

BAKER COUNTY.

(Special Correspondence.—The one-furnace copper smelting plant situated at Sumpter, which was sold at receiver's

sale some time ago and bought in by interested parties, probably will be in operation again in the next few months. ——The E. & E. mine at Bourne is being put in condition to operate again under the superintendency of John Thomas. ——The Highland, situated two miles from the old Baisley-Elkhorn, is operating with a force of about 30 men with F. J. Greene in charge. Since August 20, the property has shipped 277 tons of ore which brought $18,430 net, at the Tacoma smelter. Work has commenced on a projected 3000-ft. cross-cut that will open the vein 600 ft. below the present working adit-level. An electric-power line is close by and a 6-drill air-compressor may be installed.——The Iron Dike mine, at Homestead, close to the Snake river, has been purchased by the Lewisohns, who have had a force of men at work for some time under direction of W. B. Fisher, of Salt Lake, developing and exploring. This is reputed to be an important property, fairly well developed by adit-levels, showing a body of copper pyrite 95 ft. wide in places, containing 3½ to 4% copper, with some gold and silver in a porphyritic lava gangue. A branch of the Oregon Short Line railroad has been built from Huntington down the Snake river on the Oregon side to Homestead, over which train service has been commenced as far as Copperfield, which is four miles from Homestead. This line passes close to the Ox-Bow electric-power plant, to be finished within a year, and which will be a useful factor in mining operations in this part of Oregon and in Mineral and Seven Devils districts, Idaho.——The Oregon-Idaho Investment Co., of Baker City, which is operating the Humboldt mine and mill in Mormon Basin, Oregon, is also developing the Arkansas mine at Landore, in the Seven Devils district, Idaho, where 200 tons of 20% copper ore were sacked and shipped in the earlier stages of work.

Baker City, January 6.

UTAH.

UTAH COUNTY.

(Special Correspondence).—The Miller mine, situated in American Fork canyon, 24 miles from the railroad, has been re-leased for the year to four miners who have been doing development work the last few months. It is an old property which has produced about $1,000,000 since it was located. It yields a silver-lead ore, with some gold. It contains 20 to 25% iron, 2 to 3% silica, and 10 to 25% lime, and is desirable at the smelting plants for flux. The Dutchman and Pittsburg, in the same locality, have been shipping ore, and the Mountain Dell has done considerable development.

American Fork, January 7.

WASHINGTON.

FERRY COUNTY.

J. L. Harper has paid $11,500 upon the Pearl Consolidated property which he is working on a $225,000 bond.

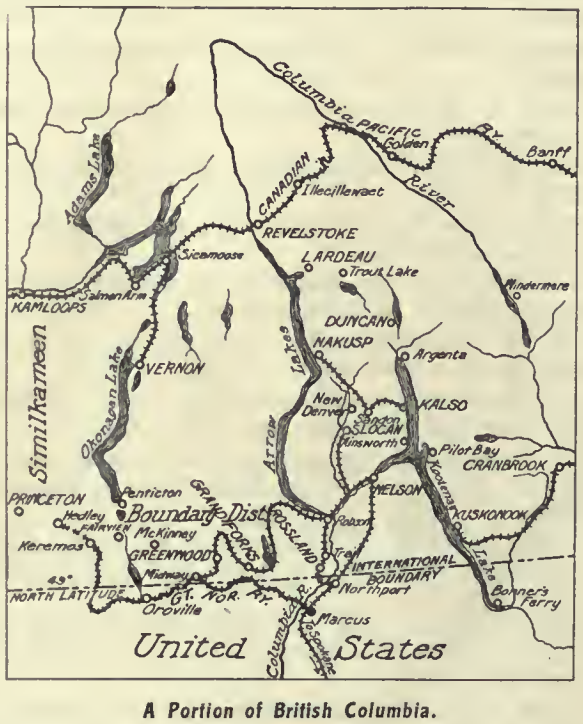
KING COUNTY.

Unusual interest attaches to the twelfth annual session of the Special Course for Mining Men at the School of Mines of the University of Washington, Seattle, from January 5 to April 5. The United States Government has just established a station at the school for instructing miners in the use of the Draeger oxygen apparatus for mine rescue work. The Government expert in charge of the station, Hugh M. Wolflin, and the State Coal Mine Inspector, David C. Botting, will give instruction to the special students on the subject of mine rescue work, mine gases, prospecting for coal, and the development of coal mines. Placer mining and the handling of water in pipes and flumes will be dealt with in a detailed manner to meet the demands of Alaskans who are adopting hydraulic or dredging methods. No examinations are required for admission to any of the studies, the object being to make them open to all persons who are engaged in mining or interested in that business. The university laboratories, assay furnaces, stamp-milling, concentrating, and mining machinery are used for making the various tests of ores and minerals. Special instruction will be given by the following well known men, in addition to the two already mentioned and the regular members of the University staff: Harvey Glenn, assayer, United States assay office, Seattle; Roger S. Taylor, superintendent of copper plant, Tacoma Smelting Co.; George Jamme, coal mine operator; Henry Landes, State Geologist. Eleven studies are given, but each student may select those he wishes to follow, up to the limit of four or five studies. The registration fee is $5. There are no other charges except the deposits in the laboratory courses to cover the materials actually used. Books may be purchased or not as desired. For detailed information, address Milnor Roberts, University of Washington, Seattle.

CANADA.

BRITISH COLUMBIA.

(Special Correspondence).—The advent of the new year has not made any great change in Canadian mining, the companies carrying the work steadily forward and having as a rule good ore reserves to start with. The shipments from the various mining districts for 1909 were as follows: Rossland, 235,090 tons, Phoenix, 1,613,039, and Nelson, 331,455 tons. It is estimated that the total value of the provincial mineral output will be about $24,425,000, being an



A Portion of British Columbia.

increase of approximately $673,700 over that of 1908. The following is a statement showing the tonnages of ore smelted by the Consolidated Mining & Smelting Co. of Canada, Ltd., at Trail, since 1899. This gives a fair illustration of the expansion of both the lead and silver business at Trail:

	Copper.	Lead.	Total Tons.
1899	.....	.....	55,702
1900	91,194	13,615	104,809
1901	122,035	21,736	143,771
1902	56,793	15,539	72,332
1903	152,914	16,892	169,806
1904	139,760	18,197	157,957
1905	214,969	25,347	240,316
1906	238,983	18,102	257,085
1907	263,910	35,021	298,931
1908	266,579	51,895	318,474
1909	374,069	55,507	429,676

Rossland, January 7.

ONTARIO.

The first carload of ore from the Blackburn mine, near Elk lake, was shipped January 4. It consisted of 10 tons of ore worth about $1400 per ton, and 10 worth $700 per ton. The ore was hauled to the railroad on sleds and it is understood that the company has about $100,000 blocked out which will be shipped in the spring.

Personal.

Professional men are invited to send news of their engagements and travels. Such news is interesting to friends.

LEON DOMINIAN is in Mexico.

G. G. VIVIAN is at Denver, Colorado.

W. A. SCOTT has gone to Los Angeles.

A. E. FIREBRACE is visiting Ouro, Bolivia.

C. C. LEHMAN is at Los Angeles, California.

W. H. GARLICK is at Los Angeles, California.

F. J. H. MERRILL is now at Nogales, Arizona.

H. F. COLLINS is at Valdelmusa, Huelva, Spain.

ALGERNON DEL MAR is at Phillpsburg, Montana.

ROBERT LINTON is at Ocampo, Chihuahua, Mexico.

H. W. GARTRELL has gone to Adelaide, South Australia.

A. R. EICHLER has arrived in San Francisco from Sitka, Alaska.

WILLIAM OLIVER is at the Cinco Minas, Hostotipaquillo, Mexico.

HOWARD W. DUBOIS has returned to Philadelphia from Canada.

LESTER W. STRAUSS has returned to Lima, Peru, from Tecopilla, Chile.

JUAN FELIX BRANDES has gone to New York for a three months' sojourn.

H. W. TURNER has been inspecting a mining property at Copperopolis, California.

G. H. DOWELL is superintendent for the Old Dominion Copper M. & S. Co., at Globe, Arizona.

LEO VON ROSENBERG, of New York, has gone on an examination trip to Peru, South America.

R. B. MCCONNEY, general manager for the F. M. Davis Iron Works, Denver, Colorado, was at Salt Lake.

NED J. CHURCHILL, formerly with the Mammoth mine, is now with the Needles Mining & Smelting Co., Kingman, Arizona.

WALTER HARVEY WEED has disposed of his interest in the C. L. Constant Co. to CHARLES S. HERZIG, and has left New York for Ely, Nevada.

HENRY KRUMB, of Salt Lake, is consulting engineer for the Ray Consolidated at Kelvin, and the Inspiration Copper Co. at Globe, Arizona.

M. E. MACDONALD has left New York for Zacatecas, Mexico, to superintend the erection of a 150-ton mill and cyanide plant for the Zacatecas Mining & Metallurgical Company.

Obituary.

HARVEY A. SHIPMAN, who died January 3 at St. Luke's hospital, Denver, was born at Waukan, Wisconsin, in 1854. He was a graduate of Lawrence University in that State, and early devoted his attention to mining. His work on the Pacific Coast will be remembered especially in connection with his management of the Searles properties. In 1899 he was called to Colorado to take charge of the Stratton's Independence. He stayed there three years and then went to Australia. After three years he returned to Denver and took up general consulting work. A year ago he went to West Africa and it was then he contracted the fever which eventually led to his death. Mr. Shipman's career was not only long, but honorable, and was marked especially by ability displayed in management and reduction of costs.

Dividends.

The Rio Plata Mining Co., with offices at 175 Fifth avenue, New York, paid its initial quarterly dividend of 1½% on December 29.

On Wednesday, January 5, the Bunker Hill & Sullivan M. & C. Co. paid dividend No. 148 of $45,000. This makes the amount of dividends paid to date $11,331,000.

LAS DOS ESTRELLAS, one of the banner mines of Mexico, paid dividends during 1909 of $1,500,000 gold, making a total distribution to date of $5,280,000. The company was organized in October 1902. The original capital stock, amounting to $150,000, has also been repaid.

GUSHERS continue to be found occasionally in the Pennsylvania oilfields even after a half century of development. Early last month at Shumiston a 7000-bbl. well was brought in, the first of this size in this field since 1900. The high grade of Eastern oil makes a well of this size especially important.

REVISION of the mining law and enactment of adequate conservation measures as recommended in the President's message, ought not to await completion of the investigation of the Department of the Interior and of the Forest Service. The two matters have no such intimate relations as require delay in what after all is the more important.

BEGINNING with the New Year the *Electrochemical and Metallurgical Industry* assumes as its future title, *Metallurgical and Chemical Engineering.* This indicates a broadening of scope, and incidentally betrays a conviction that the invasion of electricity into the metallurgical field does not mean the exclusion of the old tried and trusted methods. Electricity is one of the new giants being trained to do the work of the world, but it is still on probation in many departments where dominance was rashly promised a few years ago. Our contemporary gains by its change of name.

ATTENTION should be drawn again to the efforts making in Germany to control the output of potassium salts. A bill was recently laid before the Federal Council of Prussia designed to create a trust of all the potash mines of that country, under the auspices of the Imperial Government. Its supporters advance Rooseveltian arguments for conservation of national resources in its defense. This calls to mind the proposal in this country to prohibit the exportation of phosphate. Reprisals are possible, it seems, and Germany will evidently make the first move in the game. A special investigation by the United States Geological Survey of the available resources of potash in this country would appear to be in order. For agricultural needs a supply can be obtained on a pinch by using pulverized granite rich in orthoclase. This is now being utilized in a small way. The potash is slowly liberated by decomposition in the soil. Many granites yield as much as 6 per cent K_2O. It would be difficult absolutely to starve out the farmer, so far as a supply of potash is concerned.

but potash is an essential article in many arts, and curtailment of the German exportations, which is now threatened, makes it imperative that we take account of stock, and also investigate and put an end to the waste of this substance that is now unrestrained.

INFORMATION from credible sources confirms the rumor that work on the 'Ely Route', so-called, from Goldfield to Ely, Nevada, will begin within the next sixty days, money having been provided by Mr. F. M. Smith of borax fame, and Bernheimer & Company of New York, to complete the initial 100 miles from Cuprite, by way of Golden Arrow, to a point from which branch lines will be built north and south respectively to Tybo and Reveille. A warrant for the immediate construction of the road exists in those districts, where Bernheimer & Company expended more than a million dollars in the development of lead-silver and copper ores. Large reserves are blocked which are claimed to average above $20 per ton. A smelter at Tybo some years ago produced over three million dollars' worth of doré bars. The construction of the projected railway will greatly enlarge the area for profitable prospecting in the sage-brush State.

The Humphrey Ship Subsidy Bill.

Our calcitrant correspondent writing upon ship subsidies in another column of this issue, calls attention to the deficient earnings of the Japanese subsidized lines, and points out that only a third of the tonnage carried is of Japanese origin. This we believe to be true; and we also understand that the Chinese have long maintained a boycott against the Toyo Kisen Kaisha, which cuts out the bulk of the possible east-bound traffic, while the Pacific Mail gets the lion's share of west-bound business from San Francisco by methods that need no explaining. We have given reasons why we believe an American merchant marine would benefit the miner, without attempting in a broad way to defend the principle of subsidies. It is a form of protection analogous to the tariff, but it tends also to lead a nation to desire at least a rational tariff, if not an open market. It lies counter to the imagined interests of the steel trust and other industries which high protection serves. Hence we find the representatives of these industries persistently opposed to a ship subsidy that shall be free for all, that specially favors no transportation companies, nor restricts the use of foreign-built craft. This fact is quite enough to cause those who oppose ship subsidies as a matter of political conscience, to inquire how it happens that they so readily, though unwittingly, turn up on the side of the protected trust-barons. It is also worth while to inquire why the railroad interests are not opposing the Humphrey bill now before Congress. In some respects it appears to have merit. It has eliminated most of the perils of legislation for special interests, but it limits payment of subsidy to American-built vessels—and few can be built and operated in competition with the foreigner. It provides for ships built according to plans approved by the Secretary of the Navy, and the contemplated mail contracts could not apply to any vessels now in commission. In short, it is a pretense at encouragement, a sop to make people believe that aid has been rendered to American shipping, when in fact nothing effective has been done. The steel trust dares not reveal how cheaply steel ships can be built abroad out of American-made steel. After so many 'steels' we might be tempted to utter a pun, but the humor of the situation is obvious without crude witticism. The Humphreys bill would create a sponge to absorb the foreign mail profits of the Post Office Department, and indirectly shield the protected steel makers. We join our correspondent in condemnation of present efforts to subsidize a merchant marine, but we fancy that no one could object to encouragement of shipping that would help to build up trade for our surplus manufactures and metallic products. To do this is to help restore the equilibrium between the agricultural and metal output of the country, the disproportion between which is one of the leading causes of the present high cost of living.

Mining Legislation in Illinois.

The report of the Illinois Mine Investigation Commission, made public last week, is definite and practical. Three principal recommendations are made: (1) provision for adequate fire protection in and around mines, (2) establishment of three mine-rescue stations, (3) founding and maintenance of 'Miners' and Mechanics' Institutes' under direction of the State University. The first of these is of greatest immediate importance, the second is admittedly palliative, but the third is likely to give the largest ultimate returns.

The necessity for better fire protection in and around coal mines especially, is now generally recognized. The Cherry disaster at least served the purpose of making clear to the public the imperative need of immediate change. The detailed plans proposed by the Commission are too long to be given here. In brief they include the provision of an adequate supply of water under suitable head, delivered by permanent pipes to the bottom of the shaft and for 300 feet along the entries, automatic sprinklers in the stables and at certain other points of danger, fire hose, buckets, fire extinguishers, and other standard apparatus, telephones and gongs throughout the mine, and a rigid system of alarms, of graded authority among mine officers at times of fire and accident, semi-monthly fire drills, and frequent inspection. In addition, all mines opened in the future are to be made fire-proof from the surface to a distance of 300 feet down the main entries. It cannot be doubted that if the recommendations be enacted into law, as seems altogether likely, Illinois will have the safest mines, from the point of view of fire risk, in America.

The recommendation for the establishment and maintenance of three mine-rescue stations in the northern, central, and southern parts of the State, follows naturally from the recognition of the value of the work done by the Urbana corps and the prohibitive expense involved in adopting the foreign requirement of a supply of rescue apparatus at each

colliery. It is proposed that the State stations shall, in the main, take over the work of training men for rescue work, leaving the Federal station at the University to carry out its primary function of investigation. These general measures, having to do with present conditions, are supplemented by a recommendation that the University of Illinois be required to take up the general work of providing better educational facilities for the men in the mines by institutes, lectures, correspondence courses, or any other means likely to be helpful. It is pointed out that the State sets certain educational standards for inspectors, mine managers, and other officers, and yet provides no means by which the men, who have usually left school at an early age, may attain them. The difficulties and dangers, too, incident to the rapid introduction of uneducated foreigners in the mines are indicated, and the need of special educational facilities urged.

The proposed law has been elaborated with great care by a mixed commission, including representatives of the operators, the miners, the University, the public, and the Technologic Branch of the United States Geological Survey. Officers of the Chicago Fire Department and of the Underwriters' Laboratories have co-operated in its framing, and it may fairly be said that few bills have been written after as careful a study from scientific, practical, and commercial standpoints. The report as a whole evidences intelligent and painstaking care in its preparation, and is a credit to the members of the Commission. The Governor, Mr. C. S. Deneen, has transmitted it to the General Assembly with his endorsement, and there is strong probability that the laws asked for will be promptly passed.

Internationalization of Manchurian Railways.

In our review of Far Eastern conditions at the beginning of the year, we pointed out that interest was for the present centered largely in the railway situation. At other times we have shown that the whole problem of export trade and of a merchant marine is inextricably tangled with railway rates, foreign and domestic. Both these facts lend interest to the note recently sent to the Powers by the Secretary of State, in which he has suggested the internationalization of the Manchurian railways. For the development of China many miles of trunk and branch lines are needed, and while the Chinese have shown exceptional ability in the management of railway lines, and while the final resources of the Empire are adequate to provide what they need, it is undeniable that prompt development calls for outside capital. Not every nation is willing to take the attitude of the Australians who sacrifice the present development of the northern part of the Commonwealth rather than imperil the future by decrease in the rigor with which they maintain a 'white man's country'. China has had unfortunate experiences with foreign loans; experiences which abundantly warrant caution and reinforce the natural desire of a proud people to provide for their own development. At the same time China is awake, and her public officials realize as never before the importance of promptness if the true interests of their country are to be served. The people of the United States, in a similar situation, borrowed freely to build railways and make other improvements. Canada uses large amounts of British capital. Mexico is making good use of dollars wherever they can be obtained, and there is really no reason why the Chinese should not similarly benefit from the use of foreign money, particularly since the density of their population makes railways unusually profitable, and would enable the payment of the lower rate of interest which money demands in Europe and New York, without serious burden on the properties. The difficulty lies in the fact that he who borrows is to some extent and degree the servant of him who lends. In Manchuria both Russia and Japan now have strong footholds as a result of foreign money invested in local railway lines, and there have been many political entanglements. Not long since, when China suggested taking over the South Manchuria lines, the Japanese professed willingness to accept the offer, provided China should obtain the capital at home. The Japanese naturally objected to an arrangement which would result in their being merely supplanted by some other foreign nation which might provide money for the new securities. So long as any foreign nation dominates the railways of a particular part of the Empire and controls the railway rates, the situation will be full of danger, and the 'open door' be as much a stage property as though the custom houses were in the hands of one importer. Mr. Knox has suggested, as a means of meeting the situation, that both the Japanese and Russian lines in Manchuria be sold to an international syndicate, which furthermore shall provide funds for extensions and new lines. China is believed to be willing, and surprisingly general support has been enlisted. Russia, at first believed to be willing, now objects. Japan has not answered, but it is reported to be unfavorably impressed. If, however, the other nations agree, and that constitutes a large 'if', it is difficult to believe that the Japanese would find more advantage in refusing than in joining the new concert. It is intimated that strong American interests are ready at once to subscribe the part of the loan which might be allotted to this country, and it is also said that just prior to his death Mr. E. H. Harriman had been engaged in direct negotiations with Japan for the purchase of a large, if not controlling, interest in the Manchurian lines. The Southern Pacific, Pacific Mail, and South Manchuria, would have formed a highly effective transportation group, and would doubtless have proved a strong influence in developing American trade in China. That Mr. Harriman should have proposed such a combination is strong evidence of its value, and lends support to the belief that Americans will have part in the future development of the Empire. We believe it is purely a matter of time when the Chinese will decide to welcome rather than repel foreign help. When that time does come, an international syndicate will be better for them than the 'zones of influence' involved in the present plan. Provided that the syndicate include a sufficient number of nations, Chinese diplomacy may well be relied upon to prevent such complete harmony as might threaten native interests.

GEOLOGICAL DISTRIBUTION OF THE PRECIOUS METALS IN COLORADO.—II.

Written for the MINING AND SCIENTIFIC PRESS
By T. A. RICKARD.

The Carboniferous limestone has proved a marvellous treasure-vault to the miners of Colorado, especially as regards silver. The discovery of the chief mining districts—Leadville, Aspen, and Rico—where this geological horizon has been exploited, has played an important part in the history of the State.[1] Leadville is situated on a terrace terminating one of the spurs reaching westward from the Mosquito range, near the headwaters of the Arkansas. The Mosquito range is a faulted mountain mass of Paleozoic beds, resting on pre-Cambrian granites and gneiss. The main fault reaches into the Leadville district, but there the displacement is "distributed on no less than six approximately parallel faults, making as many fault-blocks between the Arkansas valley and the crest."[2] In ascertaining the structure of the underlying rock masses, the miner has received incalculably valuable aid from the geologist.[3] Ore has been found at successive geological horizons, represented by pre-Cambrian granite, Cambrian quartzite (53),[4] Silurian limestone (50), Devonian quartzite (48), Lower Carboniferous limestone (46), as well as igneous rocks that have penetrated the whole series and covered them. Two porphyries are distinguishable, one is a white rhyolite and the other a gray monzonite. Both are of pre-Cretaceous age, and both occur in sheets, forming 'contacts' with the limestone formations. It is along these contacts and reaching downward from them that the greatest orebodies have been found. A typical cross-section on Carbonate hill gives the following thicknesses of formations, according to Emmons:

Local name.	Geological age.	Character of rocks.	Thickness in feet.
White porphyry	Pre-Cretaceous	White rhyolite porphyry	800
Blue limestone	Lower Carboniferous	Blue-gray dolomite	200
Gray porphyry	Pre-Cretaceous	Gray monzonite porphyry	50
Parting quartzite	Devonian	Coarse quartzite	30
White limestone	Silurian	Drab silicious dolomitic limestone	160
Lower quartzite	Cambrian	Mostly white quartzite	160
Granite	Basement complex or pre-Cambrian	Granite and gneiss	.....

The White porphyry and Blue limestone of the Carboniferous gave the celebrated 'first contact', and the Gray porphyry, when covering either the Parting quartzite (Devonian) or the White limestone (Silurian), made the 'second contact', equally famous in local mining history. Favorable positions for the deposition of ore were afforded near the under surfaces of the porphyry sheets, in the vicinity of dikes, and near sharp bends in the limestone, where a fold has passed into a small fault. The ore was deposited after the porphyry sheets were consolidated, but before the great structural faulting began, for the ore measures have been dislocated, and it is in finding the broken ends of the orebodies that geological study has proved of such economic value. At first it was supposed that the Blue limestone was especially favorable to ore, and particularly under the contact with the overlying White porphyry, but as exploration progressed it was proved that valuable orebodies existed within the mass of the Blue limestone at places away from the contact, also in the Gray porphyry, and within the White limestone. Finally, ore was found within the Parting quartzite and in the upper part of the Cambrian quartzite. No important discoveries of ore have been made in the lower part of the Cambrian nor in the Archean of the basement complex, although both are ore-bearing in neighboring districts (61 and 65).

In the text accompanying the foregoing table Mr. Emmons states that the porphyries *may* have been intruded during pre-Cretaceous time. If this were so, then my idea as to the post-Cretaceous age of the eruptives associated with the gold and silver deposits of Colorado would be destroyed and one more generalization would be thrown to the scrap-heap. But if it be true that all the eruptives associated with the occurrence of the precious metal within a region so large and important as Colorado, belong to a late period of geological time, then we have a striking coincidence, which might possibly prove to be a salient fact in ascertaining the origin or mode of formation of such ore deposits. Any dictum of Mr. Emmons is authoritative, so I noted his statement with regret. On writing to him, however, he shows that the evidence is not at all conclusive and, in fact, that he himself is willing to concede the probable post-Cretaceous age of the Leadville porphyry. In a letter to me he says:

"There are two points of view, that of the petrographer and that of the structural geologist. The former, reasoning from many facts similar to that which you mention, namely, that at Breckenridge the porphyries cut Cretaceous beds, say, that the Leadville porphyries must be of post-Cretaceous age. From the point of view of the structural geologist, on the other hand, since these particular intrusive sheets at Leadville were cut by faults, they must necessarily have been older than these faults. Now the principal one—the Mosquito fault—can be traced northward and westward fifty-odd miles beyond the Leadville map, but the latest sedimentary beds displaced by it, as far as I have observed, are the red Triassic sandstones. Where the fault ends, at the northwest end of the Gore mountains, as represented in the Hayden atlas, the Dakota Cretaceous color

Aspen and West Aspen Mountain.

(which includes Jurassic) laps over across the line of the fault. This means that the fault already existed at the time these beds were deposited, and it must have been pre-Cretaceous. Unfortunately, there is no descriptive text of this portion of the Hayden maps, as Marvin, who did the field-work, died before he had time to write it up and no one has edited his material. I have planned over and over again to visit the place where this occurs, but in every case something has prevented, so that I am not able to verify this silent statement of the Hayden map, and until I do that I can have no absolute certainty. Cross considers the porphyries as post-Cretaceous, and Spurr distinctly states that they are of Tertiary age."

The ores of Rico (40) are found in lodes traversing a thinly bedded series of shale, limestone, and sandstone dipping into Newman hill. This series is a part of the Hermosa formation, as recognized by the U. S. Geological Survey.[5] The evidence of fossils has led A. C. Spencer to correlate this formation with the coal-beds[6] of the Pennsylvania division of the Carboniferous. The best ore is found under black shale and among thin lime-shales underlaid by sandstone-grits, forming a succession that presents a lithological likeness to the Weber series of the Middle Carboniferous as observed elsewhere in Colorado.

The sedimentary rocks are penetrated by porphyrite (the monzonite porphyry of the Survey), which was followed by movements that disrupted the ore-bearing veins. In the mine this porphyrite is not often visible (See Fig. 5), but it was undoubtedly the precursor of the thermal activity that was the prime agent in the deposition of ore.

The ore deposits are characterized by the occurrence of flat bodies of gold and silver-bearing zinc-lead sulphides lying at a definite horizon, which is marked by a zone of crushed rock; this zone is termed, by the miners, the 'contact'; it is disturbed and faulted by two distinct series of veins, which come up through the underlying beds. The relation between these two vein-systems and the 'contact', which is above them, presents a striking example of the manner in which the occurrence of ore is affected by geological structure.[7] Of the two series of veins, one (the Enterprise, Songbird, and Hiawatha) has a northeast strike and a nearly vertical dip. These are known as 'verticals'. They are crossed and faulted by a later system, which has nearly a northwest trend and a flat dip. These are termed 'cross-veins'. The 'verticals' are ore-bearing, the 'cross-veins' are not. Neither series reaches the present surface nor the surface of the Carboniferous formation, which is overlaid by Quaternary drift. The veins, therefore, have none of the usual outcrops; on the contrary, they break and fan out into stringers just below that zone of crushed rock which has been referred to as the 'contact'. See Fig. 1 and 2. The stringers or small branches, into which the veins scatter, are found to be connected with the ore-bearing horizon, which derived its name from a supposed resemblance to the 'contact' at Leadville. At Rico, however, while the 'contact' represents an ore-bearing zone, it does not form a continuous blanket deposit nor a wide-spreading ore-measure between an eruptive and a sedimentary rock; on the contrary, the ore occurs in narrow bands ramifying through the crushed sedimentaries in directions that correspond exactly to the *strike* of the veins underneath. I ascertained this relation in the course of actual mining, in 1894, when manager of the Enterprise mine. Moreover, it is a remarkable fact, that while the cross-veins are barren in themselves, they are, nevertheless, related to orebodies at the contact fully as rich as those connected with the ore-bearing series of veins.

The facts just summarized are illustrated in the accompanying drawings (Fig. 1 and 2), which represent a portion of the workings of the Enterprise mine, from surveys and observations made in 1894 and 1895. The plan shows how the ore-bearing veins are explored by the workings. The cross-veins are not followed by any workings save on the contact, because they become productive only at that horizon. The section illustrates how the cross-veins branch out at a certain level and are capped with the ore that follows the strike of the particular vein to which it is related. The 'verticals', or ore-bearing veins, act in just the same manner. Note, for instance, on the plan, how the ore above the Enterprise vein is projected to the west of the line of the vein by reason of the joint effects of an easterly dip and a difference of level. The irregular orebodies of the contact are indicated on the plan so as to show their connection with the vein-system. It must be borne in mind that the plane of the contact averages from 50 ft. (at the left or southern end of the drawing) to 115 ft. (at the other end) above the level of the workings shown on the map. The formation as a whole dips 15° southeast. The section will elucidate this point. On the plan it is easy to see how the orebodies are related to the different veins. The ore on the contact is indicated by stippling, and it spreads in bands and cross-bands, corresponding to veins underneath. Thus the contact blankets the whole system of veins and cross-veins, as well as the mine workings made in exploiting them. The reader should get this relation clearly in his mind. For example, the cross-veins A B, C D, and E F, are responsible for the biggest orebody in the mine; in the plan this body is seen to the south of the cross-veins that appear on the level, 48 ft. below. This orebody (W V to X Y) was first found by David Swickhimer, the original discoverer of the mine, who was searching for the Enterprise vein and thought at first that he had encountered a flattened portion of it. The ore had a thickness of three or four feet and a width of as much as 50 ft. It extended for 700 ft. in length across and above the ground traversed by the Enterprise, Songbird, and Hiawatha veins, connecting with other orebodies on the contact that corresponded to these veins, as the drawing illustrates. The next two

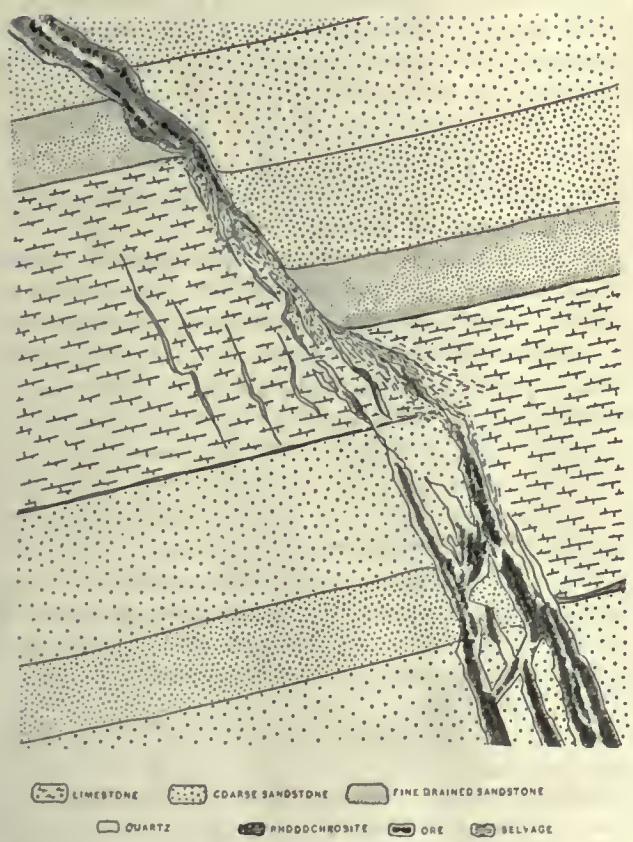

Fig. 3. A Vertical.

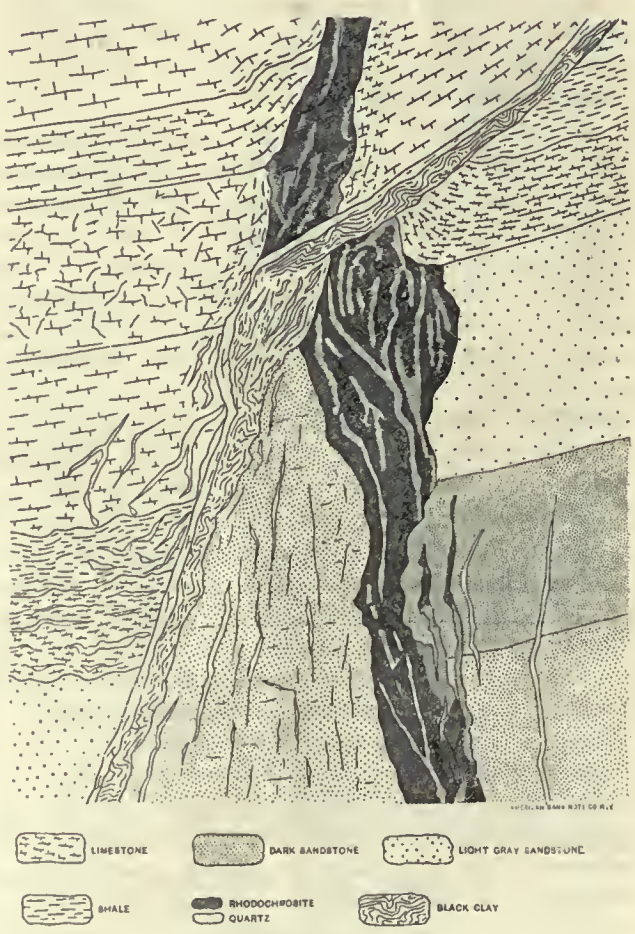

Fig. 4. A Cross-vein.

cross-veins, G H and K L, dip in the opposite direction to A B, C D, and E F, so that the ore corresponding to them is thrown 70 ft. northward, at K' L' (See plan and section). The other cross-veins can be traced in a similar way to the various orebodies on the contact having a NW-SE strike, as distinguished from the contact orebodies having a NE-SW strike, which are connected with corresponding members of the other or 'vertical' series of veins.

The dislocation of the ore-bearing veins by the cross-veins is a marked feature of the workings. As the plan shows, the faults are numerous but exceedingly variable in the amount of throw, ranging from a mere deflection to 20 or 30 ft. The direction of the throw was found, in each case, to be in accord with recognized rules of faulting and this feature did not seriously impede mining. It is interesting to note that the cross-veins O R and S T throw the Hiawatha and Songbird veins in opposite directions and toward one another by reason of the contrary dip of these two ore-bearing veins. Another result is to cause a junction of ore on the contact above these veins going north. Note also how the change in the dip of the Songbird vein, between U and Z, causes the transfer of the corresponding ore on the contact, related to that vein, from one side to the other.

The ore obtained from the contact was rich, averaging 3 to 4 oz. gold and 200 to 500 oz. silver per ton. It was essentially a mixture of sulphides, chiefly zinc blende, galena, and iron pyrite. The blende was of that straw-colored variety to which the name 'resin zinc' is often given. The gold was discernible occasionally. The silver occurred as sulphide, argentite, and to a less extent as stephanite, an antimonial sulphide. Of the 4½ to 5 million dollars yielded by this mine, about one quarter has been in gold and three quarters in silver.

In the 'vertical' veins, as distinguished from the contact, the mineralization differs. The preponderance of zinc is less marked, the pyrites of iron and copper are relatively more important, but the chief difference lies in the fact that the gangue is less metallic, that is, the sulphides form a small percentage of the ore, which is composed of a matrix of quartz and the carbonate of manganese, rhodochrosite. The last, on account of its marked color, is a beautiful feature of the workings, occurring in streaks, which alternate with quartz and cross the black beds of shale and limestone like pink ribbons. Comb structure is frequently observable.

The horizon at which the veins cease in their upward course, where also the flat bodies of ore are found, has been referred to as the 'contact' because that is the term used by the miners. At the time of my study of the vein-structure I recognized this 'contact' as a zone of crushed rock, characterized by three principal features, namely, brecciation, pulverulent lime, and gypsum. Since then the Government survey of the surrounding region has demonstrated the existence in the Hermosa formation of a persistent bed of gypsum situated at a horizon corresponding to that of the ore-bearing zone of Newman hill: therefore A. C. Spencer, to whom the recognition is due, has made the ingenious suggestion that the pulverulent lime, which is so characteristic of the contact, represents the remains of gypsum that has undergone incomplete dissolution.[8] This idea harmonizes many of the seemingly contradictory features of the ore-occurrences as described in the earlier papers by John B. Farish[9] and myself.[10] The pitted and cavernous condition of the gypsum bed to be seen in the eastern part of the Enterprise mine, the juxtaposition of the powdery remnant, and the choice of this horizon as the place of ore deposition are all explained by the existence of this soluble layer of calcium sulphate.

Above the 'contact' there comes finely laminated black shale, succeeded upward by shattered layers of sandstone and limestone. This ground has suffered from lateral shifting, which, more than actual vertical rupturing, represents the dying out of the faulting associated with the formation of the vein-fractures, much in the manner illustrated on a smaller scale in the occurrence presented in Fig. 7. Under the contact comes a layer of blocky limestone, below which succeeds a series of thin beds in which black shale predominates; these give place in depth to a succession of limestones, shales, and sandstones, of which sandstone becomes more and more frequent.

In this description, only the vicinity of the contact, which includes the uppermost portion of the two vein-systems, has been considered. It remains to state that the cross-veins are usually barren save where they include fragments of vein-stuff torn off the edges of the ore-bearing veins, at the places of intersection and faulting. The ore-bearing veins themselves become unproductive at a depth varying from 75 to 150 ft. below the horizon of the contact. They are intercepted by an adit called the Lexington Tunnel, at a level 400 ft. below the Enterprise workings, and at this depth they appear as barren veins of white quartz, traversing beds of light-gray coarse sandstone. Thus the impoverishment coincides with a change in the enclosing country. Black shale, which predominates in the productive zone, gives place to a light-colored sandstone in the unproductive. Moreover, the rhodochrosite that characterizes the veins higher up, disappears entirely in depth. The valuable sulphides also become conspicuously absent and a scattering of iron pyrite is all that remains to remind one of the lavish mineralization to be seen in the ore-bearing horizon. While rich ore is not found in any marked relation to the porphyrite penetrating the ore-horizon, there is good reason for associating the deposition of the ore with the thermal activity following upon irruptive movement. The Rico porphyrite penetrates beds of Cretaceous age, so the ore deposition was probably early Tertiary.

I have thought it well to reproduce these drawings, because they illustrate the practical application of geology to mining. The fact that the enclosing formation is Carboniferous and the porphyry post-Cre-

[8]Op. Cit., pp. 49 and 52. The material which I called "pulverulent lime" is described by Mr. Spencer as "peculiar gray marly material."

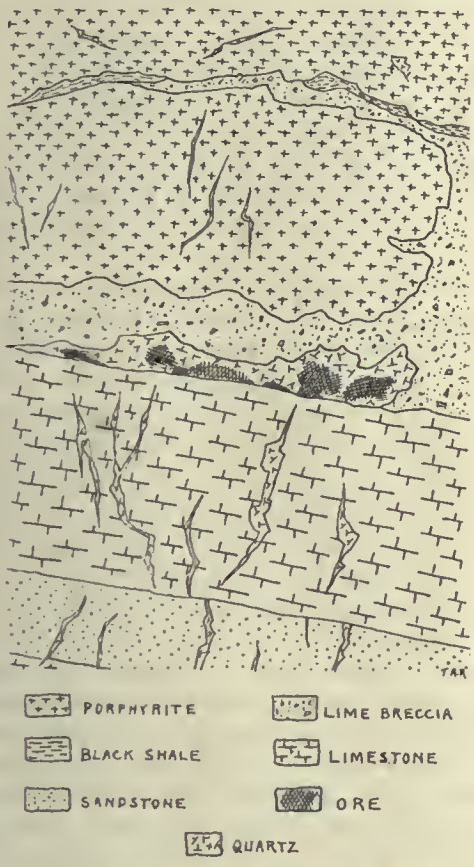

Fig. 5. Porphyrite tongue at the contact.

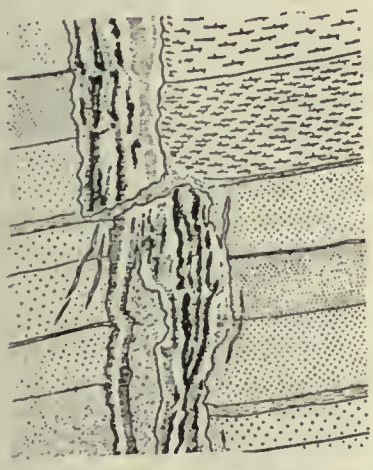

Fig. 8. A dislocation of a vein, itself following a fault-plane.

taceous is not without interest, even to the miner, but the ascertainment of the true relation between the systems of veins and the ore-bearing horizon named the 'contact' was undoubtedly of more direct benefit to those engaged in searching for ore. Yet this most important feature is not sufficiently emphasized in the Survey reports, although Tower, Spencer, and Ransome successively investigated the ore deposits.

The deciphering of the structural geology of a mining region is more immediately useful to the miner than theories concerning the origin of ore deposits, and the latter have the greatest economic value when they furnish light to the ascertainment of the facts pertinent to actual exploration underground.

SIBERIAN DREDGING STATISTICS FOR 1908.

Written for the MINING AND SCIENTIFIC PRESS
By JEROME B. LANDFIELD.

Interesting statistics of gold and platinum dredging in Siberia for the year 1908 have been gathered by the Gold & Platinum Miners' Association of Russia. Question-forms were sent to all the mine-owners, with requests for accurate and detailed information. A large number of the companies responded and gave the desired details, but several failed to do so. Out of some 64 dredges known to have been in existence in the Ural region and in Siberia, statistics of 49 were furnished. This information is not all that an American engineer could desire, but it is helpful in giving something of an idea as to conditions existing there. In giving a resumé of these statistics I will endeavor, as far as possible, to transform the Russian information into terms of our own practice.

Administratively, the Ural region is not a part of Siberia, but of European Russia. For purposes of mining statistics, however, it must be included with the former, although there are some interesting points of difference. Practically all of the quartz-gold of Russia comes from the mines of the Ural, amounting to about 40% of the output, whereas 95% of the gold produced in Siberia proper is alluvial. Furthermore, almost the whole of the world's supply of platinum comes from the Ural region, and the development of the platinum industry has had an important influence on the introduction of dredges. Quite a proportion of the dredges has been installed especially for the winning of platinum. The question of length of season is the first point that naturally occurs to the foreigner in regard to mining in Siberia, and it is interesting to note that in the case of the 49 dredges reporting, the average operation was 149½ working days, and the average number of hours that each dredge was operated was 2502. The record number of working days for any one dredge was 194, made by one of the dredges of the Neviansk company, working on the Nikolaievsk mine. Two of the dredges in the platinum region of the Ural began operations on April 2 and 3, respectively, but most of the dredges opened their season late in April, and those in the Yenesei region, for the most part, did not begin work until the middle of May.

Several of the dredges were obliged to cease operation for the season as early as October, but the majority were able to continue until nearly the end of October, and some well into November. Two dredges in the Nizhni Tagil region of the Ural, on the placers of the Demidov estate, are reported as working up to December 11. Only about two-thirds of the dredges reporting give the dates of the beginning and ending of the season's operation.

No statistics are published in the report concerning the kind of dredges used or their place of manufacture. They varied a good deal in capacity and size of bucket. Twenty had 7-ft. buckets, and there were one 6-ft., two 5½, ten 5, nine 4½, five 4, one 3½, and one 3-ft. buckets. The average amount of gravel handled per dredge during the season was 166,400 cu. yd. A comparison with the figures for 1906 and 1907 shows that whereas in 1906 the statistics for 32 dredges showed an average of 174 days of operation, with 2837 working hours, the average amount of gravel handled per dredge for the season was 159,600 cu. yd. In the season of 1907 reports were received from 46 dredges, and they showed an average season of 137¾ days of operation, with 2259 working hours, but the average amount of gravel handled per dredge was only 139,300 cubic yards.

According to the statistics available of the 49 dredges that reported their operations for 1908, the total product was 70,288 oz. gold and platinum unrefined, which the Bureau estimates, for the purpose of figuring profit and loss, at approximately $17.75 per ounce. This gives an average of 1430 oz. as the amount won by each dredge, or about $25,380 for the season. These figures are, of course, of little value, as the conditions of working are so varied as to prevent a satisfactory basis of comparison.

Perhaps the most surprising feature of the report is that which has to deal with the tenor of the ground worked. According to the figures given, the average tenor of the gravel on all the operations in which the 49 dredges were engaged was a trifle under 15c. per cubic yard. It seems almost incredible to think of working such gravel at a profit under Siberian conditions, and perhaps the best explanation is that in all probability many of these operations were carried on at a loss. The highest tenor noted was a little over 31c. per cubic yard. In this latter case a 7-ft. dredge worked 170 days, an average of 14¾ hours per day, and cleaned up 2945 oz. of gold dust and platinum, yielding in the neighborhood of $42,300. The figures on the amount of gravel handled and the tenor of the gravel cannot be considered as accurate, since many of the dredges worked under conditions that required rough approximations to determine the quantity of material lifted.

From the data available, the Bureau estimates that the average cost of dredging operations in the Ural region was about $15,000 per dredge, exclusive of amortization charges on dredge and mine equipment, while $19,000 must be allowed as the expense per dredge for operating in the Yenesei region, where conditions are less favorable. Taking $5000 as the average amount to be set aside annually to extinguish the cost of the dredge and equipment, the Bureau points out that the operations in the Ural show an average profit of $5000 per dredge, while in the Yenesei region they barely pay expenses. A comparison of the figures of production shows that four dredges yielded less than $9500 each during the season, while, on the other hand, four dredges yielded from $45,000 to $50,000 each.

Soldering aluminum and copper may be done successfully and easily by the following method: First tin the aluminum and the copper, or brass, using stearine as a flux; wipe clean, then use zinc chloride as flux, with solder composed of tin 67 and lead 33 per cent.

Vanadium has been used in cast iron with good effect, and experiments with brass and bronze show that it may be used with advantage in these alloys.

SONORA, MEXICO, IN 1909.

Written for the MINING AND SCIENTIFIC PRESS
By F. J. H. MERRILL.

The closing year has been one of renewed activity for the mining industry in Sonora, after temporarily being paralyzed by the panic of 1907. It was scarcely convalescent during 1908. The financial crisis resulted in a suspension of operations in many of the mines which had not yet become productive and were dependent for running expenses on money derived from stock-sales or from stockholders' subscriptions. The great copper camp of Nacozari continued in operation, and the Creston-Colorado gold mines near Minas Prietas kept up production under the control of Charles Butters. At Cananea, however, in October 1907, the time seemed ripe for closing the mines and renewing the smelting plant, in order to effect economies. At the same time the discharge of several thousand miners from this great camp paved the way for a material reduction of wages, which, from the operator's standpoint was of far-reaching importance, since it would result in reducing the average rate of wages all over the State of Sonora. Under the presidency of W. C. Greene the scale of wages at Cananea had been advanced until ordinary miners were paid ₱3 per day. This raised the rate throughout Sonora and proved a hardship to miners of small capital, who found themselves obliged to pay an advance of nearly 200% over the wages prevailing in the past. With the re-opening of Cananea in 1908 the scale for ordinary miners has dropped to ₱2.50 per diem.

The marked feature of the past two years is the stimulus to mining offered by the opening of new lines of railway, which give access to areas previously difficult and expensive to reach. Chief among these were the extension of the Sonora railway into Alamos; the opening of the road from Nogales to Cananea, and the rapid extension of the line up the Yaqui valley, that will give access to the rich Sahuaripa district. Work is now actively progressing on the line from Nacozari southward along the Moctezuma River valley to eventually effect connection with the Yaqui River branch.

The mineral resources of Sonora may be classified under four heads, namely, copper, placer-gold, vein-gold, and silver. The importance of the copper deposits needs no comment. The placer-gold deposits, chiefly in the Altar district, are of great importance, but have not hitherto been made productive on a large scale owing to the scarcity of water. Vein-gold appears in two classes of deposits; first, veins sufficiently large and rich to be continuously worked on a company basis; and second, myriads of small veins, often of high surface value, but too limited in extent to justify operation on a large scale. Of the first class, comparatively few have been opened. Of the older properties, those at La Colorada have been the most productive. Of the newer, Cerro Prieto or Black Mountain is striving for commercial recognition with a large mill in which no expense has been spared to supply perfect equipment and economy. El Tigre, northeast of Nacozari, is a large gold and silver property which promises to have a brilliant future. There are also many abandoned or inactive gold mines which, within the last half century, have been productive or which have records of great productivity during the colonial days. Some of these owe their records to zones of enrichment carrying high-grade, free-milling ore, now largely worked out. In other cases, no doubt, a thorough examination would show large orebodies which might be profitably worked by modern methods of cyanidation, and, as transportation becomes cheaper, these mines will be unwatered and prepared for examination.

In silver production Sonora has not a high rank compared with the great silver districts of the interior plateau. Among the older mines La Quintera near Alamos is historic as a rich producer, but, having been worked to a depth of 1500 ft., changes in the ore have been encountered which involve new methods of treatment. At Lampazos, in the south of the Moctezuma district, is a silver mine which has been productive for many years, the ore having been treated lately by lixiviation. The richest silver mine in Sonora today is that of Las Chispas in the upper Sonora River valley near Bavicanora.

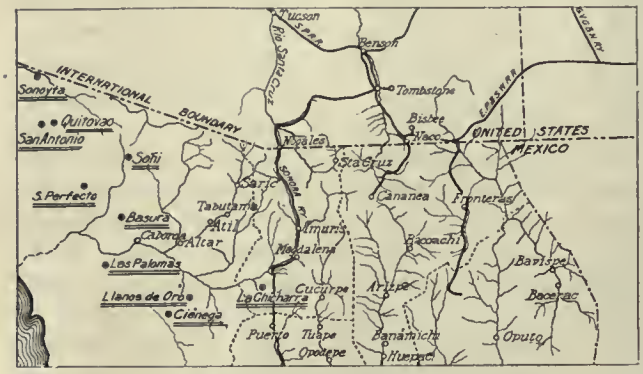
The copper production of Sonora is chiefly confined to the great camps of Nacozari and Cananea, a limited amount coming from the Transvaal Copper Co. with its small smelter near Cumpas in the Moctezuma district. Sonora, however, exhibits in all directions, at frequent intervals, outcrops of copper deposits, both large and small, which in the future will contribute to the copper production of the Southwest. During the past year a large deposit near San Antonio de la Huerta was taken over by the Cole-Ryan interests after a fruitful campaign of development. Active exploration is reported at many other points. One of the necessities for the greater development of the copper industry in Sonora is cheaper transportation of ore by rail, for there are many properties, both small and large, which would produce rich surface ores if they could be cheaply shipped to a custom smelter.

Several attempts at building up a local smelting business have been made in Sonora, but with little success, owing to lack of foresight in the original plan and to high transportation rates for ore. About five years ago a smelting plant was built at Toledo on the Yaqui river by Ohio capitalists, in the hope of securing business from the mines in that vicinity, but the high cost of fuel hauled in wagons from the railway at La Colorada had not been provided for, and the business has remained in suspense pending the extension of the Yaqui River valley branch of the Southern Pacific railway to that point. Another smelter was built at Fundición in the Guaymas district, but did not secure favorable transportation rates or succeed in making its contracts attractive to mine operators. Near Guaymas a small smelter was erected some time ago by W. C. Greene and his associates, but mainly for the purpose of holding a concession until this should become saleable. The Guaymas smelter has, therefore, never been in commercial operation.

In the Altar district, attention has been newly attracted to the operation of the cement gravel pla-

cers, by the development of a machine for breaking up this cemented material. This consists essentially of a rotating barrel having iron staves with narrow interstices between. Within the barrel and rotating in the opposite direction is a shaft to which are connected short lengths of heavy chain. These act like flails and break apart the pebbles which are united by a calcareous cement. By the beating of the chains, and the grinding action of the released pebbles within the barrel, the calcareous cement which encloses the gold is pulverized and escapes between the staves, the gold being afterward separated by a Hungarian dry-concentrator, or 'dry washer'. The principles of this disintegrator were worked out by a miner named Quenner, and it is now manufactured by Roy & Titcomb, of Nogales, Arizona.

The finely equipped 50-stamp mill of the Llanos de Oro Mining Co., which has been idle for some



Map of Northern Sonora.

time through lack of success in treating the cemented gravel in a stamp-mill, has recently been put into operation by the erection of a wire-rope tramway from the Martha mine of the Reina del Oro Co., at El Tiro, a distance of some six miles. The plan is to mine the El Tiro ore and treat it in the mill at Llanos de Oro, the lack of water at El Tiro having rendered the mill at the mine inoperative. Among the mines of Altar, the Juarez is reported as in successful operation. The Campana and La Libertad properties north of Caborca have attained successful results in development, and good orebodies are reported at the 600-ft. level. At the present time there are more Americans prospecting in this country than have been seen there for several years. It may be said that the mining enterprises begun in Sonora during the past five years have not shown a large average of success, because, as a rule, they have been started with insufficient capital and under inexperienced management. Added to these weaknesses was often the insurmountable difficulty that in the beginning the property chosen was only a one-man mine and could not stand the expenses of operation on a corporation-basis. At times, indeed, so little judgment has been shown in selection, that money was spent on a property which had no claim to consideration on any basis. There is a common tendency for people with little or no capital, who hope to make some money out of a mining scheme, to take up for flotation a property of almost no promise simply because it is cheap and within their reach. The disastrous results of such finance discredit legitimate mining and deter investors from taking up substantial propositions. Every new country must, however, pass through vicissitudes of delay in obtaining recognition, and Sonora will not lose in the end. There are few areas of its size in America which are so extensively mineralized, and in the slopes of the Sierra Madre which are now being made accessible by extensions of the Southern Pacific railway system, many rich deposits will make important contributions to the metal production of the Mexican Republic.

Barite deposits occur about two miles north of Five Islands, Nova Scotia, a village 12 miles east of Parsboro, on the north shore of Minas basin. They were recently described before the Geological Society of America by C. H. Warran. The principal outcrops are on the steep banks of the bars and east river, and at isolated points between, for some two miles. The barite is coarsely crystalline and remarkably pure. It occurs in the form of large irregular vein-like masses, usually with steep dip, associated stringers, and smaller isolated masses in an ancient fault-breccia; also as a filling for fissures sometimes several feet wide in the massive ledge-rock. The fault breccia is part of an extended zone of faulting, frequently marked by brecciation and fissuring, which lies in a narrow east-west band of much-folded Devonian slates and quartzites on the southern side of the Cobequid hills. The fault-zone follows rather closely the contact with intrusive syenites which form the core of the hills. Near the eastern end of the fault-zone, north of Londonderry, barite also occurs associated with much ankerite and iron ore, also in a fault-breccia. The barite is believed to have resulted from a leaching and concentration process which took place through the agency of water percolating downward along a zone of faulted and broken rock. The adjoining ledge-rocks contain about 0.2% BaO. A comparison with deposits elsewhere leads to the conclusion that many barite occurrences are the result of a concentrating of the barium content of limestones, sandstones, and quartzites, wherever faulting or crushing has made an easy channel for percolating waters.

More than 500 producer-gas power-plants, ranging in size from 15 to 6000 hp., are now in operation in the United States. About 88% of these plants are running on anthracite coal, a few on anthracite or coke, and the remainder on bituminous coal and lignite. In a bulletin on the recent development of the gas-producer power-plant in the United States (Bulletin 416), just issued by the United States Geological Survey, R. H. Fernald, consulting engineer, states that the internal-combustion engine has already become a serious rival of the steam-engine in many of its applications, and that the development of the large gas-engine within the last few years has been extremely rapid. Only nine years ago a 600-hp. engine exhibited at the Paris Exposition was regarded as a wonder, but today four-cycle, twin-tandem, double-acting engines of 2000 to 3500 hp. can be found in nearly all well equipped steel plants, and some plants in this country contain several units rated at 5400 hp. each.

HYDRAULICKING PIPE-CLAY GRAVELS.

Written for the Mining and Scientific Press
By Dennis H. Stovall.

In the vernacular of the California and southern Oregon hydraulic miner, the 'pipe-clays' consist of those portions of the gravel banks carrying 'pay', that is, they constitute a false bedrock on which gold lies concentrated. As a usual thing, they are found in the middle and lower strata of the Pacific Coast old channels. The breaking up of these clays causes some difficulty at times. Placer mines which failed under one management are often highly profitable under another, with the same equipment. The difference was in the manager himself; one could not recognize 'pipe-clays', the other could, and knew how to deal with them.

The identification of these 'pipe-clays', these 'working grounds', as some surface miners call them, is a simple matter. Practically all the old channels which form the basis of the California and Oregon placer mines, are the beds of ancient rivers and streams. The geology of the property is of little or no interest to the average placer miner. Interesting as its story may be, he throws aside the ancient mortars, pestles, and other relics that his giants uncover, and occupies his mind with the getting of gold. The fact that he might be uncovering relics older than Herculaneum interests him not at all. One such channel extends all the way from Humboldt county, California, to Douglas county, Oregon. This one, no doubt, is the largest of them all, as it shows a width at several places of a half to a full mile. This ancient river was in existence before the present chains of the Siskiyou and Coast mountains were upheaved. The filling of the old bed—the gravel, boulders, and débris—comprise the 'working grounds' of the hydraulic mines. How the gold came there is a matter for the geologists to explain. It is a question of erosion and concentration by the washing of floods.

Old Channel Gravel Mine With Pipe Clay

Today patches of the old river channels are found on the very tops of mountains. The distribution of the gold through the gravel is in many cases a matter of its being held there by these false bedrocks of 'pipe-clay'. If the 'pipe-clays' lie in strata so thin that a mountain of débris must be removed to uncover them, then it were better to shut off the water and 'hang up'. It costs money to move mountains, even by the hydraulic method, and the wise miner will make sure of the returns before he begins. There is no branch of mining that offers better opportunity for making sure than hydraulicking. If the miner will, he can estimate the worth of his ground closely before a dollar is expended in equipping for actual operation.

The accompanying photographic illustration gives

a general idea of the character and formation of some of these Pacific Coast old channels, and of the general nature of the 'pipe-clays'. The picture shows an 80-ft. bank comprising the 'fill' of an ancient river channel. Bedrock is slate, in some places serpentine, and at others granite. Above the bedrock, and forming the lower strata, are the boulders and heavier rocks. These usually carry coarse gold. The 'pipe-clays' are easily distinguished. The strata lie in horizontal and parallel streaks of blue and gray, blending into the darker brown of the upper capping. The bank shown in the picture has only a thin capping on the surface, fully three-fourths being 'pay gravel'.

The gravel with the 'pipe-clays' is small. There are some boulders, but they are never so large that the giant's stream cannot easily tear them from the parent bed, hurling them down the sluices. There is usually an entire absence of 'cement'. The 'pipe-clay' gravels yield readily, 'melting' like an ash heap when the streams strike them. Blasting may be required for the lower strata. The depth of the 'pipe-clay' banks ranges from 10 to 250 ft., with an average of from 60 to 80. In Galice district, southern Oregon, the banks are extremely high. One mine in that camp has a working bank over 1000 ft. long, with a height of 265. The 'pipe-clays' and the lower strata of this enormous gravel-pile consist of three-fourths the entire content. On account of their great height, however, it is necessary to work the banks from a distance of 400 ft., with a battery of giants operating under 500-ft. head of water.

A feature connected with a thick surface capping is its 'flour gold'. This frequently occurs in considerable quantity. It is so light and fine that it can only be saved by a system of undercurrents attached to the regular sluices. As long as the water of the sluices is in agitation, the 'flour gold' will not settle. The undercurrents are arranged to draw off, or rather 'draw down', the water through apertures in the bottom of the sluices, spreading it over broad riffle-tables covered with burlap, into which the fine gold settles. To clean the undercurrents the burlap is lifted carefully and rinsed in vats of still water in which the fine gold particles settle. The 'pipe-clays' of the western channels often carry gold at the rate of from 8 to 20c. per cubic yard. If the upper capping is not too thick, the miner can move the ground at a cost of 4 to 5c. per cubic yard.

Cadmium melts at a low temperature, and, like bismuth, lowers the melting point of alloys in which it is used. Bismuth, however, forms brittle alloys, but many alloys of cadmium are ductile and malleable, yet hard. The melting points of these alloys are lower than the melting points of any of the metals composing them. Several of them liquefy at temperatures considerably below that of boiling water, and a silvery-looking 'trick' teaspoon made of one of these compounds melts in a cup of tea, to the great astonishment of the tea-drinker. An alloy of cadmium is used in making automatic fire extinguishers, in which water under pressure is released in a jet or spray by the melting of cadmium under the heat of the fire.

VOLUMETRIC ESTIMATION OF URANIUM AND VANADIUM.

A review of the methods previously published was given at the Fortieth General Meeting of the American Chemical Society by Edward DeMille Campbell and Charles E. Griffin. Experiments show that vanadium may be satisfactorily determined by reduction with sulphur dioxide and titration with permanganate, and vanadium and uranium together may be reduced by boiling with a spiral of heavy aluminum wire and titration with permanganate after the removal of the aluminum wire spiral and the addition of an excess of ferric sulphate. In the analysis of carnotite ore, after solution of the ore in nitric acid and evaporation with sulphuric acid, the vanadium and uranium are separated from iron by double precipitation of the latter with sodium carbonate in the presence of a little hydrogen peroxide. In the acidified solution the vanadium is first determined by reduction with sulphur dioxide to V_2O_4 and titration with standard permanganate, after which the vanadium is reduced by boiling with aluminum to V_2O_2 and the uranium to UO_2. After complete reduction of the uranium and vanadium, acidified ferric sulphate is added, and the solution is titrated with standard permanganate.

Severe earthquakes were felt in Alaska in September 1899. They were accompanied by faulting, tilting, and warping in the Yakutat Bay region. There were shocks for 27 days, including five or six world-shaking disturbances and hundreds of minor shocks. On one day there were over fifty minor shocks and two world-shaking disturbances. These were recorded by seismographs throughout the world. In Alaska, Yukon Territory, and British Columbia the shocks of September 3 and 10 were felt throughout an area of at least 217,000 sq. mi. on the land, and perhaps as much as a million and a half square miles. Only 20,000 persons were in the area affected, 250 close to the earthquake origin, and 8 men right on one of the faults, but there was no loss of life and insignificant damage to property.

CALIFORNIA PETROLEUM IN 1909.

Written for the MINING AND SCIENTIFIC PRESS
By An Occasional Correspondent.

It is too early to give exact figures of the petroleum output of California for 1909, since the returns for the month of December have not yet been received from the producers. It is known, however, that California led all other States in the production of mineral oil in the year just closed, exceeding Oklahoma materially, not only in number of barrels, but in total value. In 1908, according to the United States Geological Survey figures, Oklahoma produced more barrels of oil than California, although the California oil was valued at $5,735,659 more than the total output of Oklahoma. For 1909 this State exceeds Oklahoma both in number of barrels produced, and also in total value. It is apparent that California has increased its output in 1909 over the previous year by as much as ten to twelve million barrels, and also that prices were much better than during the previous year.

A review of the conditions existing in the different oilfields of California in 1909 has already appeared in these columns. This was in a condensed form, it being virtually impossible in a limited space to go into close detail of the developments which have occurred during the year in the various producing fields. When the year 1909 opened it is estimated there was a daily production of about 6000 bbl. more than the consumption warranted, and this was being stored. In the beginning of 1910, however, nearly that much is being drawn from stocks, so that consumption is rapidly reaching the amount of daily production. The demand for oil is on the increase, but the California wells are increasing their yield far beyond the expectations of a few years past. A year ago the daily production was about 142,000 bbl., and now it is nearer 158,000.

The following table, based on actual returns for 11 months, and a conservative estimate for December, shows the output of petroleum in barrels in the different oilfields of the State in 1909.

CALIFORNIA OIL, 1909.

Field.	Barrels.
Coalinga	15,161,570
Coyote	85,500
Fullerton	4,334,730
Kern River	15,090,050
Los Angeles City	554,745
McKittrick	5,071,736
Midway	2,389,230
Newhall	125,649
Salt Lake Field	3,490,225
Santa Maria	7,995,085
Sunset	1,918,575
Ventura	407,040
Whittier	861,591
Summerland	65,997
Total for 1909	57,551,723

This estimate is conservative and will be found close to the truth when all returns are in. There are now upward of 4000 producing wells in the State. The aggregate yield of these in December was the largest in the history of the State, being considerably above 5,000,000 bbl. When all the wells are considered, the daily average runs from 41 to 45 bbl. per well per day. As may be noted, the field making the largest production for the year is Coalinga, in Fresno county. The Kern River field does not run far behind, and with all its fields, Kern county far exceeds in oil production the other counties of the State. The Santa Maria field continues to make a satisfactory record, and has exceptional shipping facilities to tide-water.

Average price per barrel in 1908 was determined by the United States Geological Survey at 52.25c. In 1909 it had materially increased, but it is difficult as yet to fix an exact average. In some fields the price is higher than in others, and, moreover, large quantities of oil are still being sold under old contracts at low prices. It is probable that 56c. may be considered a fair average price for the output of 1909, and it is expected that 1910 will see an average price of 60c. per barrel. The oil industry of the State is in a flourishing condition, with its increasing yield and the increasing consumption. The value of the oil produced in the State now greatly exceeds that of both gold and silver, a condition which could hardly have been predicted a decade since.

SOME PHYSICAL PROPERTIES OF SULPHUR TRIOXIDE.

Sulphur trioxide, according to D. M. Lichty, purified by repeated distillation of the commercial article over pure phosphorus pentoxide in a vessel exhausted to 50 mm. or less, melts sharply at 16.8° (Weber 14.8°), boils at a temperature not exceeding 44.8° under 760 mm. pressure, and seems to be purer than that prepared by Weber. If kept from contact with moisture, it retains its sharp melting point, and at the room temperature is in appearance a transparent mobile liquid which really consists of a liquid variety, containing, dissolved in it, and presumably in equilibrium with it, a considerable quantity of a solid variety. The depression of the freezing point of phosphorus oxychloride, caused by this mixture, leads to the formula SO_3. The coefficient of expansion is very high, agreeing essentially with that found by Schulz-Sellak and by Schenck. If exposed to a relatively small amount of moist air, the liquid solidifies quite completely at room temperature. The depression of the freezing point of phosphorus oxychloride, produced by a completely solidified sample, also leads to the formula SO_3. The ordinary asbestos-like needles seem to be a polymer having the formula S_2O_6.—*Jour.* Amer. Chem. Soc.

The Soo Canal is the only internal waterway which has had its capacity increased faster than that of the railroads serving and served by the Great Lakes which it links. The Soo Canal opened to commerce a little over 100,000 tons in 1855 with a depth of 11½ ft. on its mitre-sills, when there was a scant 8 ft. of water on the St. Clair flats. Successive enlargements of the locks and deepening of the restricted Lake channels now give an available depth of about 20 ft. In 1907, 58,217,214 tons of freight were carried through the locks of the Soo. The freight was slightly over 20% of our railroad tonmileage. The cost of service fell from 1.5 mills in 1888 to 0.69 in 1908, 9% of railroad rates.

Discussion.

Readers of the Mining and Scientific Press are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy. The Editor welcomes the expression of views contrary to his own, believing that careful criticism is more valuable than casual compliment. Insertion of any contribution is determined by its probable interest to the readers of this journal.

Ship Subsidies.

The Editor:

Sir—You have recently had a good deal to say about the encouragement of an American merchant marine without, as I think, achieving your usual convincing result. Perhaps the letters of Mr. Newlands (November 20) and Mr. Van Wagenen (December 25) have sufficiently brought out the objections to the proposal, but there are still a few arguments which may properly be urged. Doubtless all of us would be glad to see 'the American flag in all ports of the world'—who doesn't like to hark back to the Golden Age?—but that is hardly a valid reason for embarking on a course of expenditure which would be a serious burden on an already deficient treasury. So, too, we have all been chagrined at the spectacle of our Navy dependent on foreign colliers and supply ships. As to the latter, Mr. Newlands' suggestion is excellent. Let the Navy build or buy such vessels as it needs, just as it builds and buys battleships and cruisers. The merchant vessels can, if not needed in time of peace, be leased for use in trade. A few might be used to advantage in giving the Pacific ports the same connection with Panama that the Atlantic cities have with Colon. For a general merchant service, however, other means must be devised or we must continue to allow the foreigner to carry our goods for us. Personally, at least for the present, I favor the latter. If other people are willing to tax themselves either in the form of lower wages and interest returns, or of direct subsidy, in order to perform for us a service cheaper than we can do it for ourselves, why not let them do it? It has recently been shown that the Japanese lines, despite the subsidy they are receiving, are not making money, and also that approximately one-third only of the freight which they carry is Japanese in origin or destination. In other words, the Japanese pay taxes for the privilege of carrying American goods to China cheaper than we can do it ourselves. So long as they are content to do so, why should we compete with them?

As to the argument that shipping lines stimulate development of business and, specifically that additional lines to the Orient would secure us a much larger share in that trade, I can only say that this argument is much overworked. Trade involves buying as well as selling, and must be conducted at a profit, or it cannot survive. What, may I ask, are we prepared to buy from China and Japan in such enormous quantities as the ease supposes? Also, is it proposed that we shall grant a subsidy large enough to overcome for the importer the disadvantage he labors under in the matter of our tariff? If so, why the double payment? How, too, about the goods we sell? It is admitted that we manufacture at higher cost than our competitors—else why the tariff—and it follows that our subsidy must then be large enough to offset this increased cost of production. It looks suspiciously as though Peter would again have to submit to a smaller income in order that Paul be the richer. Now, as a matter of fact, there are a considerable number of ships going out annually from Pacific ports which sail with insignificant cargoes—because the trade does not, under present conditions, exist. Furthermore, there are regular lines from the Gulf and Atlantic ports to Central and South America (someway it is so easy to overlook these boats) and these carry very little freight outward. If, however, the argument that steamship lines will build up trade against these disadvantages be held valid, still another difficulty remains.

It is but an inexperienced traffic director who has not learned that through lines alone stimulate little traffic. It is the feeders and distributors which count, and to our proposed lines to the Orient we must add control of warehouses and railway lines in the foreign countries. The system to be complete would need to include an alliance of American railways to gather goods, American steamers to carry them over the ocean, and at least some American-controlled foreign railroad lines or other equally efficient distributing system. Mexico has shown that control of railways can be utilized quite as effectively as control of customs to stimulate native industries, and our own people have protested against Japanese discriminating railway rates and supposed rebates in Manchuria as violations of the 'open door', rather than of customs discrimination. It will do little good to carry our manufactures to foreign ports and leave their sale and distribution in the hands of our competitors. So long as our exports consist largely of raw materials which foreign countries must have, we need have no fear that they will fail to reach their markets. Such foreign trade in manufactures as we now have has been largely built up by the railways, including our own Great Northern and Southern Pacific, by the United States Steel Corporation, the Standard Oil, and similar agencies. Is it proposed to subsidize them?

Outcrop of Orebodies.

The Editor:

Sir—Your editorial criticism on 'Outcrop of Orebodies' is most appropriate and suggestive, but your statement, "When gold veins contain appreciable amounts of manganese, accompanying placer deposits need not be looked for," is much stronger than my premises warranted, and as it stands I hasten to disclaim such responsibility. The wise prospector will look for placer gold at appropriate places in any mineralized area, but I wish to make the point that he should not abandon a highly manganiferous outcrop of a quartz lode after merely superficial prospecting, especially in a region where the gold is finely divided. Your suggestion that this problem should be investigated experimentally is timely. Still, not a little work has already been done, and this, it seems to me, shows that gold is

not dissolved to any great extent at the low temperatures and pressures which prevail near the outcrops by the chemical compounds which are commonly contained in mine-waters, except on the presence of oxidizing agents, of which manganese oxide is probably the most important, because it gives up its oxygen readily to form chlorine in the presence of sulphuric acid and salt, both of which are generally present in vadose mine-waters. In the laboratory free chlorine is usually prepared after one or the other of the following reactions:

$$MnO_2 + 2NaCl + 3H_2SO_4 = 2H_2O + 2NaHSO_4 + MnSO_4 + 2Cl.$$

$$MnO_2 + 4HCl = 2H_2O + MnCl_2 + 2Cl.$$

The analyses of mine-waters show that salt and these acids, or their ions, are generally present, but of course the solutions are dilute compared with those used in the laboratory. Above 100°C. gold is dissolved by many compounds, but such reactions are certainly not applicable to the problem in hand. It should be remembered in this connection that a small amount of manganese makes a big showing in the oxidized outcrop, and that coarse gold dissolves slowly, even in rather concentrated solvents. As already stated, there are certain mining districts where the lodes are manganiferous and where placer gold is won, but the placers are small compared to those which form below the lodes which carry coarse gold and which do not carry appreciable quantities of manganese.

I agree with you that the economic geologist should apply his principles with great caution to each particular deposit, and should endeavor as far as possible to master all the facts pertaining to it, and to properly weigh each one in the diagnosis of each outcrop or deposit, and that he should frankly disclaim the gift of prophecy. Still if his opinion regarding what is not fully exposed be valueless, why should anyone employ him? The statement that of two rocks or ores, the one which resists erosion longest tends to monopolize the outcrop, is almost axiomatic, although you intimate in your editorial that the deductions drawn may suggest to the untrained a too optimistic conclusion. To me it is unthinkable that one should buy a claim on the strength of an exposure of a narrow outcropping lode because the lode is more easily eroded than the rock, yet this fact may warrant him in sinking a pit below the outcrop in order to ascertain whether the lode becomes wider down the dip. My statement is that "not all, but a majority of such lodes, will increase in depth," which is another way of saying that an easily eroded rock will be removed more rapidly than one which is more resistant, a statement which should not be difficult to comprehend. On the other hand, he should be particularly cautious when he is called upon to appraise the possibilities of a large promising outcrop which is much more resistant to the processes of weathering than the enclosing rock. I have in mind a deposit in Nevada, the outcrop of which consists of a large mass of nearly pure quartz. The country rock is limestone, and is eroded at a much more rapid rate than the orebody, so that the latter forms the crest of a good sized hill. Some 40 years ago an engineer examined it, and on the basis of his report his clients paid three million dollars for the property. It proved to be a chambered vein and its depth was not much greater than its width, and the profits which it yielded hardly equalled the purchase price. Many other examples could be cited where siliceous bedding plane deposits or siliceous saddle-reefs in limestone show outcrops out of all proportion to their width below.

Insurance and Mine Accidents.

The Editor:

Sir—Noting the article by G. W. Traer in your issue of November 27, on 'Insurance and Mine Accidents', I have thought a brief account of the plan of the Federal Mining & Smelting Co. might be of interest. The Federal company is operating four mines in the Coeur d'Alene, employing from 1200 to 1400 men. The company at one time carried accident insurance as a protection to itself in case of recovery of damages by an injured employee, but this plan proved unsatisfactory, as in many cases where an equitable settlement could be promptly made with an employee the mining company was absolutely prohibited by the terms of insurance from proposing or making settlement, and the insurance company would refuse to do anything until suit was instituted, and then a reasonable settlement was generally impossible because there were attorneys to be taken care of as well as the injured employee. It is true that the company was fairly successful in the litigation, and in most cases was able to show to the satisfaction of the jury that the company had not been guilty of negligence, but the litigation cost something, and, worse than that, the company was prohibited from treating with its employees in a friendly and considerate manner.

Under these circumstances the management, in 1904, concluded to do away with the casualty insurance, and evolved a plan of mutual insurance as follows: An association called the Federal Provident & Accident Insurance Association was formed, consisting of the mining company and its employees. A monthly due of $1 was collected from each employee, and the company contributed an amount equal to 50% of the amount contributed by the employees for an insurance fund. The association is governed by a board of trustees composed of a representative from each mine elected by the employees, an equal number appointed by the general manager of the company from the company's staff, and, in case of a tie, the general manager casts the deciding vote. This board passes on all claims against the Association and conducts its entire business. The members of the board serve without pay, except the secretary, who receives $15 per month, and the members get their actual expense incurred in attending the meetings, as the mines are situated in different towns.

The following benefits are provided for: In the event of the death of a member as a result of injuries received while on duty, the widow and minor children, if there be any, shall receive $1500; if there be none, then the parent, sisters, or brothers dependent upon and actually receiving support from

the deceased, shall be entitled to receive $1500. In cases where there are no dependent heirs there is no payment, as the theory of the insurance is to recompense one for the injury resulting from the loss of support, and not to enhance the value of the deceased's estate. In the event of the total disability of a member he shall receive the sum of $1500; the loss of the sight of one eye, or the use of one limb shall entitle the injured to receive $750. In the event of a member being injured so as to necessitate the loss of time and the care of a physician, he shall be entitled to receive $10 per week benefit for every week he is unable to work, not to exceed ten weeks, after the first five days.

Considerable latitude in the matter of granting relief is allowed the board of directors; they being able to take up any case and grant such relief as, in their judgment, the circumstances warrant. Thus the board has at times arranged to take care of the funeral expenses of deceased members, where the deceased's estate was not sufficient to look after it; also relief has been granted in cases not covered by the by-laws.

The plan was put in operation in January 1904. Three Coeur d'Alene operators, the Federal company, Larson & Greenough (afterward absorbed by the Federal), and the Hecla company, all agreeing to adopt it at the same time. These companies put it in force without submitting to a vote of the men, as it was considered that less contention and ill feeling among the body of the men would result than would follow if it were put to a vote and a lot of agitators were given an opportunity to stir up strife. Out of the entire crews less than ten refused to become members, and since the working of the plan has become familiar to the men it is doubtful if any one would be willing to forego its benefits for the cost. The employees at once selected their representatives from the different mines, who proved to be level-headed men and highly appreciative of the trust imposed on them. They exhibited courage and firmness in resisting demands for relief that did not seem warranted, and painstaking care in looking into the merits of all claims, with the result that the Association gained the confidence of all its members.

The Association has distributed nearly $20,000 annually in payment of benefits and claims, and litigation between the company and its employees has been largely done away with as a result of its existence. Every six months the board of directors examines and verifies the amounts collected from the men and the amounts paid in by the company, and renders to the members a full detail statement of all amounts received, and of all claims allowed, giving the name, injury, and amount allowed each claimant.

Albion, Idaho, December 7.

Modern Quicksilver Reduction.

The Editor:

Sir—I was greatly amused when I read an article written by Clifford G. Dennis 'on the train', November 20, published in the Mining and Scientific Press, December 4 last, on 'Modern Quicksilver Reduction', saying that a well built furnace of the Scott type properly conducted was all right, but that the brick condensers connected with this same plant are about as poor as it is possible to have, and that they are accountable for most of the loss in the reduction of mercury ore. The basis for his claim I do not know, but I will say that my experience covers a period of 24 years at the quicksilver mines of New Almaden. I have a few facts to adduce in defense of the quicksilver condensing plants as a result of my long service in New Almaden. We experimented with many different kinds of condensers, wood, glass, iron, and water, but obtained unfavorable results. While I was in New Almaden, I invented what is known as the Scott furnace, having erected a number of this type at the Almaden mines, all with brick condensers connected. This mine for many years produced an average of 2000 flasks per month paying to the stockholders in New York several millions of dollars in dividends. I have also erected several plants with brick condensers at nearly every great producing and dividend-paying quicksilver mine on the Pacific Coast; such as Oat Hill, New Idria, Mirabel, Oceanic, Great Eastern, and the Helen mine in Lake county, owned and operated by Andrew Rocca, one of the best known quicksilver men on the Coast. I also erected many plants in Texas. At the Marfa & Mariposa my first 10-ton furnace produced from 300 to 400 flasks per month for over two years, the largest yield for one month being 432 flasks. Also the Chisos of Texas is a good producer. All of these plants have brick condensers built by myself.

I would like to add that over 97% of all the quicksilver produced on the Pacific Coast was condensed in brick condensers. I am now erecting one of my new improved furnaces for the Santa Rosa Quicksilver Mining Co., S. A., with brick condensers, near Cuernavaca, in the State of Morelos, Mexico, protected by patent obtained in the Republic of Mexico through the Dewey-Strong patent agency.

Robert Scott.

San Jose, California, January 11.

The use for titanium which gives promise of greatest expansion, is in steel and cast iron, according to F. L. Hess, of the United States Geological Survey. In steel it is ordinarily added in the form of ferro-titanium (containing preferably from 10 to 20% of titanium) in quantity sufficient to form about 0.1% of the steel. Rails treated with titanium and laid in places on railroads where the wear was especially hard are said to have shown much greater resistance than untreated rails. Gray cast iron also is said to show beneficial effects from such treatment. Cupro-titanium is manufactured for use in bronze and other castings containing copper. The titanium acts as a deoxidizer, much like phosphor-tin, and makes very tough castings. Another use of titanium which promises to assume considerable proportions is the manufacture of electrodes for arc lights. Titanium ore in the form of rutile, which is titanium dioxide, has been mined in Nelson county, Virginia, where a plant has been erected to extract the metal from the ore. Titaniferous iron ores are mined in New York, Minnesota, and Wyoming.

Special Correspondence.

GUADALAJARA, MEXICO.

Cinco Minas —Daly-Estate Projects.—Bramador Mines.

The Marcus Daly estate, represented by H. E. Crawford, has closed the deal for the famous old Cinco Minas in the Hostotipaquillo district of Jalisco. A check for a little less than ₱500,000 was turned over to José Martinez and José G. Montero, the Guadalajara owners of the mines, by Mr. Crawford. The deal is one of the most important in the mining history of Jalisco. The Cinco Minas have been under option to the Daly estate for the last year. At the time the option was arranged by Mr. Crawford ₱50,000 was paid, and later a payment of ₱20,000 was made. The price originally agreed upon was ₱530,000, but later certain rights held by the Mexican owners were included in the deal, and the total investment is about ₱570,000. During the year the mines were examined by Ernest A. Wiltsee, John B. Farish, and Frederick A. Ross. The report of Mr. Wiltsee was unfavorable, but Mr. Farish, who followed him, refused to sustain his findings, and in November last Mr. Ross recommended the purchase of the mines. According to estimates made by Messrs. Crawford and Ross, the ore now in sight in the mines has a value of fully $3,000,000. During the last few months a shaft has been put down 200 ft. below the old tunnel-level, and much driving has been done. The average of the ore so far opened below the tunnel-level exceeds $11 per ton. The Cinco Minas are Spanish *antiguas* that have been worked at intervals during the last 200 years. The interests that sold them to the Daly estate have owned them for the last 30 years, and in that time several bonanzas have been taken out. The total production runs high into the millions. It is now the intention to sink the shaft from the tunnel-level to a depth of 2000 ft. The tunnel is the deepest of the old workings, and is but 500 ft. below the outcrop. Much additional drilling, hoisting, and pumping machinery will be installed, a modern reduction plant with an initial capacity of 250 tons per day will be erected, and $25,000 will be spent in building a wagon-road from the mines to the new Southern Pacific line. Electric power will be transmitted to the Hostotipaquilla district by the Chapala Hydro Electric & Irrigation Co. of Guadalajara in April or May of this year, and a contract for current up to 1000 hp. will be made.

Paul de Vilaine, a French capitalist, who some time ago acquired the old Refugio mine in the Bramador district of Jalisco, has taken an option on the other principal old mines of Bramador, which were under option to John Hays Hammond and the Guggenheims about three years ago for ₱300,000. The price specified in the new option is ₱100,000 less. Mr. de Vilaine is re-opening the Refugio, and expects to interest associates in the purchase of the other old mines. He is interested in the Franco-British Syndicate formed re-rently to build the Guadalajara-Chamela railroad. The promise of activity in the old Bramador district recalls the fact that four brothers of the noted Dr. Robert Koch, of Berlin, Albert, Adolph, William, and Ernest Koch, were prominently identified with the district in its bonanza days. They came to Mexico early in the seventies, and the stories of the Bramador riches caused them to settle there. They were graduate chemists, and were the first to introduce the modern system of assaying in that portion of Mexico. The brothers became interested in mines and erected custom reduction works, and their knowledge of chemistry and metallurgy enabled them to get better results in the treatment of the Bramador ores. While the operation of the mines continued their earnings were large. Albert, Adolph, and William Koch died in Jalisco. Ernest Koch, now old and in poverty, was recently given a place at the Refugio mine by Mr. de Vilaine. Water and fires forced the abandonment of the Bramador mines before a depth of more than 350 ft. was reached. In the bonanza days 15 *haciendas de beneficio* were in operation in the district. Some of the ore taken out contained 50% silver. The Hammond-Guggenheim option was dropped during the financial depression.

JOHANNESBURG, TRANSVAAL.

Titanic Iron.—Crucible Experiments. — Waste Sorting. — Geological Survey and the Rand. — Government Leases. — A Contrast in Headgears.

The possibility of founding a commercially successful iron industry in the Transvaal is a question again receiving attention. The hopes of Natal have been practically blasted by the unfavorable report just issued by F. H. Hatch upon the Colony's mineral resources. In the Transvaal, doubt still lingers. The ore found in sufficient quantities to support an industry contains a high percentage of titanium dioxide (15%); the ore of suitable quality is in deposits of inadequate bulk. A heated controversy is waging as to the practicability of utilizing the titaniferous ore successfully. For the first time, the matter is being studied with scientific thoroughness. The Government has proved keenly interested in the problem and has engaged the services of F. W. Harbord, who is now investigating the resources. G. H. Stanley, a professor of the Transvaal University College, has been conducting crucible experiments, and is now continuing tests in a small blast-furnace. The early results have been described in a paper before the Chemical, Metallurgical & Mining Society. Mr. Stanley's early results suggest that by combining the Transvaal's silicious and titaniferous iron ores, a mixed ore could be obtained which is not far from being self-fluxing. "Approximately one-half ton of a 30% silica-iron ore would furnish all the silica required by a ton of the 15% titaniferous ore, and this one and a half ton of mixed ore would only require about two or three hundred weight of non-silicious dolomite." The moot point of the action of titanium in the slag was dealt with in the following words: "The titanium, in all probability, exists in the slags wholly or partly as Ti_2O_3, which acts as a base, at any rate when sufficient silica is also present. It is conceivable that, like alumina, it may act as an acid in very basic slags. * * * With regard to the iron, this, in most cases, was white, and when gray was obtained, it seemed to be as often a consequence of extra high temperature as of extra silica in the slag." Mr. Stanley's investigations have been scientific, while Mr. Harbord's will be largely industrial. The latter expert has by no means inspired the public with large hope of success. At the same time, feelings of high optimism have been expressed by sound authorities. W. Bettel keenly opposes the sanguine view, and protests against the assertion that an iron industry can now, or at any period in the near future, be established in the Transvaal to work successfully against over-sea competition.

The scarcity of ore for the mills, experienced at many mines owing to the labor shortage, is likely to be followed by a drop in the percentage of waste rock sorted on the belts, tables, or floors. The Rand's average, however, remains at about 13%. Examining the returns for a recent month, the sorting done by the different groups appears as follows:

	Per cent.
Robinson Group	10.2
General Mining (Albu's)	10.3
Consol Gold Fields	10.6
Wernher-Beit Eckstein	11.8
Farrar	13.3
Barnato	14.8
Newmann's	15.1
Goerz	19.4

The Robinson Group's sorting is the lowest, although the Randfontein Leader (narrow and worked by hand-labor) presents good opportunities for close sorting. The highest percentage is recorded by the Goerz group (largely owing to the fact that two out of its four mines lie in the Roodepoort district), which, so far as sorting appliances go, is the worst equipped. For efficient sorting, there is nothing to surpass the old-fashioned floors, upon which all the coarse must be handled, but the higher efficiency is heavily paid for even with the 1s. and 1s. 6d. labor employed for the work.

The Transvaal Geological Survey Department has issued

its report for 1908, which is well up to the high scientific standard of previous productions. From the economic standpoint, the most valuable portions of the Report are those dealing with (1) the tin deposits of the Rooiberg, and (2) the gold, galena, and zinc blende occurrences of the Marico district, West Transvaal. It is believed that the Survey will shortly turn its attention, after a long appeal by those who have not fully appreciated the greater demands for the investigation of the unknown districts, to the Witwatersrand. The work will be of immense value. It is often argued that the Rand, being so well known, does not call for such Government examination and report. Let this delusion be dispelled. In the first place, there exists no monograph upon the geology of the Rand worthy of mention; this in itself is a statement of fact which may astonish many. Secondly, the very few geologists who are intimately acquainted with the several thousands of square miles represented by the Witwatersrand formation have been signally timorous of expressing their opinions as to the solution of the Rand geological problems, though never loath to propound theories as to the character or origin of some comparatively valueless occurrence in more distant places. The origin of the gold in the 'banket' is one question that has certainly received a good share of attention from qualified petrologists. But even in this connection, one can see wide scope for underground and field work. The recent investigations of Young and Weber, pointing to

Worcester Shaft, Johannesburg. Vertical Depth, 150 Feet. Sunk in 1889.

an association between acid intrusives and the gold, do not appear to have been associated with the necessary fieldwork, which should involve a long period of mine examination. Still more glaring is the need of a thorough weighing of evidence on other questions. We may ask for some conclusions as to (1) the conformability of the Upper and Lower Divisions of the Witwatersrand, (2) the identity of the Rietfontein series, (3) the nature of the disturbances that affect the formation at the South Randfontein Deep and cut off the 'reef', (4) the puzzle of the Steyn Estate Reef, (5) the identity of the 'reef' cut in the Pullinger bore-holes, and many other points, studiously avoided by sound geologists, and the common theme for ambiguous discussion by scribbling cranks and pretentious 'experts' employed by syndicate promoters. It is to be hoped that the Survey will receive a sincere welcome. Genuine mining interests have nothing to fear and a great deal to gain by a proper elucidation of problems on the Rand. Yet it is possible that a little snarling may be heard. Once before, the Survey approached the Rand in its examination of the district to the north of Krugersdorp, and most unfortunately it blundered in its determination of what is probably an outlying fragment of Lower Witwatersrand formation (on Zwartkop), classifying it erroneously as the old Swaziland system. The criticism in opposition was scientifically strong enough without abuse. The spirit of the attack told its tale. The Geological Survey will have to proceed with tact in exercising influence and pursuing investigations in the mines.

The Government appears to have made good headway in the disposal of its assets in mining rights under water-rights and unpegged ground. The firm of Barnato Bros. has been successful in its tender for working the two Government leases (each over 100 claims) on Modderfontein, which will mean, labor permitting, that two great mines will be started in the East Rand, in the profits of which the Government will share on the basis of a sliding scale. The terms have not yet been fully disclosed. In addition, it is announced that the Mining Houses and the Government have also come to terms in regard to the basis of settlement in the water-right and 'bewaarplaatsen' negotiations. The value of the ground being agreed upon, the company receives 2s. 6d. per ton and 25% of the distributable profit for working the ground, the rest going to the Government 'for disposal'. It is rumored that the just claims of the freehold owners for a share of this interest have been favorably considered by the Commission.

The two photographs published herewith provide an interesting graphical contrast between the new order and the old in the construction of headgears over Rand vertical shafts. One represents the old wooden structure over the Worcester shaft of the Ferreira, one of the first to be erected on the Rand. The Worcester shaft, 12 by 5 ft., is of three compartments and cuts the reef at 150 ft. vertically. In the early days, ore was drawn from here and sent down to a 20-stamp mill at Turffontein Spruit. That

Turf Shaft, Johannesburg, 4066 Feet Deep. Cut the Vein in 1909.

was the time when the ore was taken to the water instead of the water to the mill. The Worcester shaft is no longer used for hoisting. The other headgear depicted is that over the Turf shaft of the Village Deep, Ltd. This shaft is 44 by 9 ft. in the clear, and is now 4066 ft. deep, with development proceeding on three levels. Like all modern Rand vertical shafts, its longer axis is at right angles to the strike of the formation. The steel headgear is over 100 ft. high.

GOLDFIELD, NEVADA.

Production for 1909.—Consolidated Report. — Florence Goldfield.—Reduction Plants.

The gold production of the Goldfield district in 1909 was probably in the neighborhood of $11,000,000. The list of the State bullion tax agent, in which the figures for the last quarter are estimated, shows that taxes were paid upon a production of $9,621,900, but the agent admits that a large portion of the product has escaped taxation, and while the entire State paid bullion taxes upon less than $25,000,000 he appraises the year's output at $35,000,000. Dividends were paid within the calendar year 1909 by four Goldfield mining companies amounting to $5,303,483, distributed as follows: Consolidated Mines Co., $4,981,283; Florence Goldfield Co., $210,000; Combination Fraction Co., $92,200, and Consolidated Red Top Lease Co., $20,000. The ore reduction plants in operation have been the 100-stamp mill of the Consolidated, the capacity of which has recently

been increased to 900 tons daily, the Florence 40-stamp mill, enlarged by the addition of tube-mills and other equipment, and now treating 160 tons daily, the 20-stamp mill and sampler of the Nevada Goldfield Reduction Co., the milling department of which is under lease to the Combination Fraction Co., and the large crushing and sampling plant of the Western Ore Purchasing Co. Net profits of approximately $7,000,000 have been made from mining in the Goldfield district during the past year. A statement of the production of the Consolidated shows that the company mined 229,142 tons during the calendar year, of which 227,620 tons were milled, the balance being shipped to smelters. The recovery was $7,996,612 with total operating expenses amounting to $2,140,092, and net profits $5,901,519. In these figures the returns for December are estimated. For that month 20,260 tons were treated containing about $649,000.

The gross assay-value of the ore produced during the year 1908-09, according to the company's report just issued, amounted to $7,386,450, from which was realized a recovery of 92.5%, or a total of $6,832,652. This was the return from 194,479 tons of ore, which therefore averaged $37.98 per ton gross. The total operating expense was at the rate of $6.77 per ton, making gross expenses of $1,572,251. The net profits were $5,026,619, out of which was made a dividend distribution of $5,000,000, or $1.40 per share. The Combination mill was injured by the cave of the Hampton stope and ceased operating September 25. The new Consolidated 100-stamp mill was placed in commission on December 26, 1908. Additions and betterments throughout the year gradually increased the tonnage treated until, by October, a steady average capacity of 649 tons per diem was attained, with a milling cost of $1.915 per ton, and an extraction of 94.49% of the gold content. The average assay-value of the ore sent to mill was $33.45, and the average extraction for the year was 92.66%. The concentrate-treatment plant took care of 7005 tons, yielding a return of $2,728,185. The cost of treatment was $6.50 per ton. The concentrate is passed over amalgamating plates on its way to the cyanide treatment plant. J. H. Mackenzie announces improvements, as a result of his own experiments in the refining of the cyanide precipitate, which will enable the company to produce bullion 990 fine, at a decrease in cost. The concentrate-treatment plant has been in operation since March, and is saving $25 per ton over the previous costs. Stoping costs per ton were $2.38, transportation 10c., milling $2.30, and development $1.56. The high ratio of development to stoping bespeaks the earnest effort of the management to procure reserves giving demonstrable longevity to the operation of the mine. The ore reserves are estimated at 800,000 tons. This accordingly represents nearly four years' supply. The distribution of the total costs is:

	Per ton.	Total.
Labor	$2.81	$533,776.81
Supplies	2.15	407,060.03
Power	0.41	76,271.74
Department	0.55	106,097.08
Construction	0.10	19,095.24
General Expense	0.32	57,769.77
	$6.34	$1,200,071.27

In the matter of ore production the following credits to the several mines of the group are given:

	Tons.	Average per ton.	Gross value.
Combination	64,537	$52.24	$3,371,613
Mohawk	78,520	30.22	2,373,182
Red Top	48,894	28.46	1,391,756
Clermont	2,529	98.82	249,899
Totals	194,480	$37.98	$7,386,451

In the Mohawk much ore is still left in the old lease-blocks, and stopes of large size have been opened between the 450 and 600-ft. levels, the ore being richer than in any other portion of the Mohawk workings. The glory hole of the Combination is being extended in length, and rich ore has been revealed on the 230 and 280-ft. levels. The Hampton stope has a maximum width exceeding 70 ft. and, in addition to the high-grade milling ore, it produced 1193 tons of shipping ore having a gross assay-value of $684.38 per ton. Further development indicates that the Combination vein at a depth of about 300 ft. joins the Mohawk vein and dips rapidly away from the Combination shaft. Hence it is not anticipated that the known orebodies extend downward in the vicinity of this shaft below 380 ft., the present deepest level. The Red Top shows a large increase of ore reserves. The Clermont shaft in the Jumbo has reached a depth of 1050 ft. On the 750 and 900-ft. levels the downward extension of the Mohawk ore-shoot is being successfully developed for a length of 300 ft. On the 750-ft. level for 100 ft. the ore has averaged $450 per ton, and the average ore outside of this richer zone assays about $30. Within the year changes have been made in the organization, whereby the Goldfield Consolidated Mines Co., from being a mere stockholder, succeeds to actual ownership of the Goldfield Mohawk, Red Top, Jumbo, Laguna, and Goldfield Mining companies. The details of the financial arrangements are given in the report. The mining, milling, and transportation branches have been segregated by the organization under the laws of Wyoming of the Goldfield Consolidated Milling & Transportation Co., putting the railroad, water, and milling departments under management distinct from the mines. This admits of making a depreciation charge, effecting a reduction in the amount of bullion-tax that would otherwise be collected. The new company has a nominal capital of $400,000, divided into $100 shares. Commencing the year with a cash balance of $786,188, the parent company has completed its mill, extended development work, perfected its general plant, purchased proprietorship in the subsidiary mines, paid dividends, and begins the new year with a cash balance of $1,365,324. It has, furthermore, bullion and concentrate in transit amounting to $479,341.

J. R. Finlay has arrived here from New York and has assumed the management of the Consolidated mines, succeeding J. H. Mackenzie. The new equipment of Chilean mills, concentrators, etc., in the Consolidated mill is now in operation and running smoothly, and it is believed that the capacity of 900 tons will be exceeded.

The Florence Goldfield mine is credited with a production during last year of 37,087 tons with a recovery of $730,610 and net profits aggregating $269,752, the figures for the last quarter being estimated. The average value of ore treated was $19.75, and total costs of production $12.49 per ton. This heavy cost is explained by the fact that a large sum for mill construction and enlargement was charged against production as well as the extensive development carried on. For a large part of the time only 20 stamps were in operation and the mill treated only low-grade ore, chiefly from the old lease dumps. No official estimates of the value of ore reserves can be obtained but they are thought to be worth $10,000,000. Connections have been made from the main shaft with the Little Florence, Gem, Baby Florence, Engineers' and Rogers-Syndicate workings, and the north drift at the 350-ft. level has exposed good ore for 500 ft. Rich orebodies are being developed down to the 500-ft. level, and the main shaft will later be sunk to the 1000-ft. level.

BUTTE, MONTANA.

Labor Situation. — Ophir Mine. — Davis-Daly. — Butte-Ballaklava Hoist.—Copper Merger Talk.

The Montana labor situation, in its relation to the mining industry in Butte, seems to be slowly righting itself, and the mines that had been closed for six or seven weeks are gradually being re-opened. In fact a normal condition would already prevail but for the shortage of coal and electric power at the mines. Extremely cold weather has prevailed throughout the State and the Northwest for nearly two months; railroads have been tied up by snow blockades, and the coal shortage at the mines and for domestic use in Butte has been a serious problem. It is now believed that the strike situation on the railroads will be ignored by the miners, which seems to be the easiest way

out of a critical situation. An unusual and tense situation was created when John D. Ryan, president of the Amalgamated Copper Co., announced that all the Amalgamated mines and smelters would be closed unless the miners' union receded from its position of sympathy for the striking switchmen, and if that union did not support the union of smeltermen in an effort to end the strike and resume work with the aid of non-union switchmen if necessary. With a complete suspension of mining operations held before them as a threat, idleness without credit in the midst of the coldest winter ever known in Montana, the miners reiterated their sympathy for the striking switchmen and refused to support the attitude of the Great Falls smeltermen. However, it was later understood, from leaders of the miners' union, that while the union declined to stultify itself by bowing to a threat, the miners would not actively oppose a resumption of railroad switching under strike-breaking crews. The railroads therefore put strike-breakers to work and the transportation of ore to the smelters was resumed. Since then the mines and smelters have been gradually resuming operations.

The Butte Central Copper Co., owner of the Ophir mine, has been heavily financed and will resume operations with $200,000 available for the treasury. Capitalists of Montreal and Boston are in the company. The Ophir mine has been a good producer for a number of years, but no attention has been paid to a large copper-bearing vein which has been cut on one of the upper levels, although assays of 7 to 13% copper have been taken from it. The mine has been opened to a depth of 500 ft., and the old silver vein has shown some good copper assays, indicating that the rule prevailing in all mines of the Butte district is true for the Ophir. In the opinion of W. L. Creden, the company's engineer, the cost of the concentrator and preliminary work will be about $100,000, while Mr. O'Connell says he can put the mine on a paying basis with $25,000 to $30,000. The Ophir mine has an interesting situation and an interesting theory regarding it. The theory is that the veins in the Ophir will be found to unite at a depth of 1500 to 2000 ft., and because of the fact that the cross-fissures have for ages served as a drain and waterway for the copper solutions from the enormous veins of the Anaconda hill, it will be found that where the veins unite, and where there has been a re-deposit of the copper in solution the greatest copper deposit in the world will be found. Many mining men hold to that theory and belief.

It seems likely now that the Davis-Daly Copper company will be granted a franchise by the city of Butte to build a tramway from the Colorado mine to the old Hesperus shaft in the southern part of the city, in order to connect with the Great Northern railway and ship ore to the concentrator owned by F. A. Heinze at Basin. The management of the Davis-Daly says that as soon as the tramway and ore-bins are built the Colorado mine will resume ore shipments. The Davis-Daly had shipped a considerable quantity to the Washoe smelter, most of it mined from the 1500-ft. level of the Colorado. The report is again current, and coming from more authoritative sources than usual, that the Davis-Daly company will soon be in need of additional funds and that some scheme for borrowing, or another assessment on the stock, will have to be resorted to. In Butte it has been a firm conviction since the last assessment was levied that further assessments would have to be made before the company could hope to make a producing mine of the Colorado.

There has been delay in the shipment of the new electric hoisting engine for the Butte-Ballaklava Copper company, but it is expected that it will be shipped about January 20. In the meantime the Butte-Ballaklava will continue operations with the smaller hoist now in use, with which the mine has been developed to a depth of 1400 ft. The new hoist will be able to work to a depth of 2000 ft. The new steel head-frame, 100 ft. high, has also been completed, and the concrete foundation for the new engine laid. The new hoist will be provided with automatic controlling devices for safety. The old steam-hoist will be kept as an auxiliary plant. While the shaft was being enlarged a great deal of development was done on the lower levels, and large bodies of ore blocked.

If there is anything in the renewed reports that, as a preliminary to the big copper merger, the Cole-Ryan and Amalgamated companies of Butte will be combined, nothing of an authentic nature is known in Butte. John D. Ryan, on his recent visit here, disappointed the public by failure to make any important announcement.

Strangely enough, there are many mining men in Butte and the West who now believe that a great deal of the copper merger talk that found its way into print was in aid of an Amalgamated pool, and that with the practical failure of the pool the merger talk gradually subsided.

TORONTO, CANADA.

Porcupine Lake Goldfields. — Cobalt Shipments. — Gowganda. — Electric Power at Cobalt.—Coal from the Arctic.

The Porcupine Lake rush is the feature of the mining situation at present, quite overshadowing Cobalt and the other silver fields. The frequent reports of big discoveries appearing from time to time were naturally received with a good deal of skepticism, owing to the unfortunate experiences at Larder Lake, but official corroboration as to the richness of the district leaves no room for doubt. J. F. Whitson, assistant chief of the Surveys branch of the Ontario Department of Mines, has just returned from a ten days' trip to the Porcupine Lake goldfields, and is thoroughly impressed with the importance of the district as a gold-producing country. He declares that, with the exception of Cobalt, it is more promising than any other part of Ontario. There have been so far 2000 claims staked. The entire townships of Whitney and Tisdale have been taken up, with the exception of some locations reserved for veteran soldiers before the discoveries, and in addition about two-thirds of the two adjoining townships to the south are staked out. The new arrivals number about 50 daily, and hundreds of prospectors are doing development work on their claims. The O'Brien Mining Co., and the New York Syndicate, have each 25 men at work on properties near the southwest corner of Tisdale. On one of these, under the management of Mr. Timmins of the La Rose, a quartz vein has been stripped for 1300 ft., and in many places it shows a width of 20 ft., with free-milling gold visible throughout its extent in many places. The road from Milepost 222, on the Temiskaming & Northern Ontario railway, about 30 miles long, has been finished. It is an all-land route through a level country, and affords easy access to the goldfields. A number of road-houses have been built, and at Porcupine lake about 50 stores and stopping places are being erected. The existence of fine water-powers within easy distance will be an important factor in the economical development of the mines. A large number of men who have figured prominently in Cobalt have gone to Porcupine lake, including Robert Bryce, Robert G. Leckie, M. C. Culvert of the O'Brien mine, Burr Layton, and George Turnbull.

Shipments of Cobalt ore during December amounted to 2971 tons, bringing the total for the year up to 30,098 tons, as compared with 25,463 tons in 1908. The largest shipper was La Rose with an output of 6384 tons, Nipissing following slightly behind, with 6253 tons. The discouraging feature is the slow increase in the number of shipping mines. There were 27 on the shipping list in 1907, 29 in 1908, and only 30 last year, the increase in tonnage being due only to the augmented output of a few large mines. Under these circumstances it is hardly to be wondered that the cheaper Cobalt issues remain stagnant. The dullness of the market has lately only been broken by a spurt in Kerr Lake, which, however, has not affected the general list. Out of 25 Cobalt stocks only five sold higher at the close of 1909 than at the end of 1908, the great majority of the others being much lower. As for Elk Lake and Gowganda they have so far failed to realize the brilliant expectations of a year ago, but considerable allowance must be made for transportation difficulties. The first shipment has just been made from the Gowganda district, the Blackburn mine, Miller Lake, having forwarded 36 tons of high-grade ore to the smelter at Copper Cliff. The mine is operated by a close corporation, the controlling interest being held by the

International Nickel Co. Fifty men are employed and there has been considerable development at a depth of 100 ft. Further shipments are expected shortly. The much-advertised Bartlett mine, in the Gowganda district, has closed for want of funds.

The delay in furnishing electric power has been a considerable drawback to development at Cobalt, but this appears likely to be overcome early in the season. The Mines Power Co. is developing power at the Matabinchonawa river, where there is a fall of 310 ft., for the supply of electricity and compressed air to Cobalt, and is reported to have made good progress, so that the power will shortly be available. The Cobalt Lake company has shipped 35 tons of ore for treatment by the Dominion Metal & Refining Co., at Toronto, being the first shipment to this point. The ore will be treated by the Oxford process.

John E. Wilkinson, of Toronto, and many others charged with illegally receiving or selling Cobalt ore, were brought before the police magistrate here on January 6, and committed for trial by a jury. The evidence submitted showed the receipt of money by returned checks of the Wilkinson firm. Samples of coal brought back by Captain Bernier from his last cruise in the arctic regions are being analyzed at Ottawa, and the tests so far made show it to be a good class of fuel.

NEW YORK.

Copper Stocks. — Copper Merger Talk. — Combination at Ely. — Pioche.—Santa Gertrudis Promoter's Profits.—Cortez Associated Mines.—Cornelia Copper.

While the general market conditions have been such as to nullify a good part of its influence, the January report of the Copper Producers' Association was in reality one of the best prophetic indications of a better copper market. The decrease in accumulated stocks of copper during the month of December was a comparatively negligible quantity, being only a little more than half a million pounds. Prior to that time there had been no decrease registered since the month of August, when there was a decrease of 32,261,454 lb. The consumption ran ahead of production during December, with the result that there was a decrease of 11,237,416 lb. One of the interesting utterances recently on the copper situation, somewhat in line with the interview of J. Parke Channing, is an interview with Daniel Guggenheim, endorsing Mr. Channing's position as to the possibility of the comparatively early exhaustion of known copper ore reserves, and expressly calling attention to the fact that a guiding hand is needed to correct existing conditions in the copper market. Many of the larger producers are among those known as high-cost coppers, and many are today, Mr. Guggenheim says, mining their ores without reasonable commercial profit. He says, further, that what is a reasonable return on commercial investments is by no means adequate to compensate those who develop large mining enterprises.

The outlook for a copper merger seems to be doubtful, and plans are much awry. There has been considerable interest evinced in affairs at Ely, where the Ely Central is being examined by Charles S. Herzig on behalf of interests within the company, and by other engineers for outside New Yorkers. It is said that there is a movement on foot to acquire the Guggenheim interests in the Nevada Consolidated on behalf of a consolidation to include the Nevada Consolidated, the Giroux, and possibly the Ely Central. The commission paid to John Hays Hammond and his syndicate, which secured the option on the Santa Gertrúdis for the Camp Bird people amounts to 119,000 full paid shares of the new company, the Santa Gertrúdis, Ltd. The examinations for the Camp Bird company were made by R. J. Frecheville and Rowland Cox, of the firm of Spurr & Cox. The Proprietary Mines Co. of America has ordered Sweetland filter presses for its Tajo de Dolores mine at Guanajuato, also 20 Westinghouse electric motors for the power-plant. New York interests have secured an option on the Prince Consolidated at Pioche, Nevada. It is claimed by the vendors that the property now makes a large showing, having ore to the value of $8,000,000 net blocked out. There is evidently to be a rejuvenation at Pioche. Development work on the joint properties of the Nevada-Utah and the Ohio-Kentucky at that camp has been encouraging and plans for a smelter and additional transportation facilities are to be pushed. The Cortez Associated Mines, an organization which is to work along the lines of the General Development Co., has been organized among Boston and Michigan copper interests. The stock subscription books were placed in the hands of Wrenn Bros., of Boston and New York, and the shares offered were subscribed several times over. The activities of the new concern are to be largely in the State of Hidalgo, Mexico.

I am informed today that the General Development Co., which controls the Miami, Ray Central, the New Keystone, and other copper properties, has secured an option on a large block of the stock of the Cornelia Copper Co. The Cornelia is owned by a group of St. Louis, Missouri, capitalists; the property being in Mariposa county, Arizona.

SALT LAKE, UTAH.

Park City Merger. — International Smelter Delayed. — Utah Consolidated Aerial Tramway.

A conference has been held in New York for perfecting a merger of a larger portion of the mineral-bearing area of Park City. David Keith, president, and Thomas Kearns, general manager, of the Silver King Coalition Mines Co., have been in attendance at the conference, which was held at the invitation of Hayden, Stone & Co. The purpose of the meeting was to get the consent of the controlling interests in the Silver King to a merger of properties, which would include a number that are now in litigation over titles. Hayden, Stone & Co. agreed to finance the proposed company, and give the controlling interests in Silver King a cash consideration for their stock. The return of Keith and Kearns has thrown no light upon the situation, but it is understood that they have practically agreed to accept certain terms for their holdings, and that the proposal is acceptable to Hayden, Stone & Co., provided the Silver King mine proves up under an examination. The big mine has been a steady producer since 1890. During that period it has yielded upward of $25,000,000, and dividends to date have amounted to almost $12,000,000, while a million has been expended in surface improvements, including a mill of 300 tons daily capacity. Its ores are silver-lead with some copper and gold. There is said to be ore in sight to make it a paying mine for more than ten years to come, the ore averaging about $45 per ton. The mine has never been troubled with a heavy flow of water. It is opened by a shaft 1300 ft. deep and a tunnel over two miles long. It has been the principal producer in Park City for 15 years, and is paying quarterly dividends of $187,500. The proposed merger does not include any of the regular producing mines of the camp except the Silver King.

E. P. Mathewson, general manager of the International Smelting plant in Pine canyon, has just made an inspection of the works in course of construction. The structural steel material has been delayed in transit, and the extremely cold weather put a check on concrete construction. The mammoth stack is about 40% completed, and the force of 600 men employed is pushing work as fast as conditions will permit. Some disappointment is felt over the delays which will prevent starting the plant by April 1, the date on which ores are to be received from the Utah Consolidated mine at Bingham. The officials cannot give the date on which the furnaces will be blown in. For a time it was feared that the Utah Consolidated mine would have to close for a few months until the new smelter was completed, but it is understood that shipments will be continued to the Garfield smelter under the old contract for a reasonable length of time.

The Utah Consolidated has all of its towers in place for the aerial tramway, except two in Pine canyon. Almost all the machinery on the east side of the mountain is in place, and the controlling station on the summit will soon be completed. The terminal station at the International Smelting plant has the concrete work in, and the steel structure is now being placed.

General Mining News.

ARIZONA.

COCHISE COUNTY.

A recent report to the stockholders of the Heffern Mining & Development Co., operating at Douglas, stated that the shaft was down 500 ft., two cross-cuts run on the 400-ft. level, and ore opened that assays 2½% copper with several dollars per ton in gold and silver.——The ore recently found on the 400-ft. level of the Holbrook shaft of the Copper Queen company has been cross-cut for 65 ft. without reaching the limit of the orebody. The ore was found in territory that was previously thought barren of commercial bodies.——Sinking is to be resumed at a depth of 620 ft. in the shaft of the Bisbee Extension company, operating west of Bisbee, and a heavier hoist installed. George W. Long is superintendent.——The Germania and April Fool shafts of the Calumet & Arizona company, at Courtland, have been connected on the 500-ft. level and preparations are being made to ship the ore to the smelter at Douglas. A double-drum hoist is being installed at the Germania shaft and sinking will be continued to a depth of 1000 ft. ——Ore assaying $1792 per ton has been found on the Eagle claim in the same district.

GILA COUNTY.

(Special Correspondence).—The work of clearing away the wreckage resulting from the accidental destruction of the large hoist at the A shaft of the Old Dominion mine, December 31, 1909, is in progress. A small hoist is now being moved from the C shaft for temporary work at the A, where 373 tons per day is being hoisted. A small compressor and a 750-kw. electric generator are being added to the equipment at the power-house of the Old Dominion smelter.——Sinking has been resumed at the No. 4 shaft of the Miami property. This shaft is now slightly over 450 ft. deep, and will be put down to the 700-ft. point. The Miami Copper Co. is employing about 600 men in mining and construction work. The foundation of the concentrator is over two-thirds completed. The building of a large warehouse, a 65 by 75-ft., two-story office building, 5 cottages, and 4 bunk-houses is nearing completion. One Star churn-drill is being operated on the northwest part of the Miami property. Two more churn-drills will soon begin prospect work. Eventually, all the Miami land will probably be drilled. B. Britton Gottsberger is resident manager, N. O. Lawton, mine superintendent, and H. Kenyon Burch in charge of the concentrator construction.——The McGaw shaft, through which all ore will be raised from the Superior & Boston mine, has been sunk 35 ft. below the 600-ft. level. Sinking will be continued indefinitely to open the orebody at greater depth. The piers for the 200-ton ore-bin being erected at the McGaw shaft have been completed, and all the timbers for use in constructing the bin have been framed. There remains 85 ft. of cross-cutting to complete the connection between the McGaw shaft and the Great Eastern workings.

Globe, January 14.

MARICOPA COUNTY.

A meeting of the stockholders of the La Coronada Mining Co. was held at Phoenix and S. J. Tribolet re-elected president. The company is operating the La Coronada mine near Florence and has cut the ore on three levels from the 255-ft. shaft. The board decided to sink to the 300-ft. level, cross-cut to the ore, and commence stoping as soon as heavier machinery can be installed.

MOHAVE COUNTY.

L. McKesson has opened a 30-ft. vein on the east side of the range between Goldroad and Union pass that assays $11.50 per ton. This is important on account of its accessibility to power and transportation.——The new shaft at the Sunnyside mine, at Oatman, opened two ore-shoots that were each about a foot wide, and averaged about $35 per ton.——At the Carter mine, in the same district, the shaft is down 250 ft., and is expected to cut the vein within a short distance.——A pump is to be installed at the Ruth mine, near Goldroad, as there is too much water in the shaft to be handled with the bucket. A sample taken across the face of the 100-ft. drift assayed $84.76 per ton.——M. D. Thomas has taken charge of the Tennessee mine, one of the properties recently acquired by the United States Smelting, Refining & Mining Co.——The Golconda mine, at Cerbat, which was forced to stop shipping a short time ago on account of the heavy roads has resumed and is sending out 1000 tons per month.

PIMA COUNTY.

A new whim was installed at the shaft on the Teliurium claim of the Gold Bullion Mines Co., operating in the Baboquivari mountains, and a steam-hoist will be placed on the Last Chance claim in a short time. On the 180-ft. level both east and west drifts are in ore. A meeting of the stockholders was held at Tucson recently and the same board of directors re-elected.——The shaft at the La Mexicana mine, south of Tucson, is down 100 ft., and has been in ore assaying from 8 to 15% copper with a small amount of silver from a depth of 18 feet.

CALIFORNIA.

EL DORADO COUNTY.

(Special Correspondence).—The Invincible Mines Co. has been formed with a capitalization of $500,000 to operate the Invincible group. John A. Britton, P. M. Reeves, E. V. T. Lee, H. Bostwick, and C. W. Conlisk, all of San Francisco, are directors.——The 10-stamp mill at the Mount Pleasant is running 10 hours per day. The December clean-up approximated $6000. With the return of warm weather the mill will be operated continuously. Excellent ore is being opened at the 400-ft. point.——Henry Odium has been awarded a contract to drive a new adit at the Eagle. The orebody is 4 ft. wide and averages $12.50 per ton. The mine is opened to a depth of 330 ft., and has a productive record of $1,000,000. L. J. Kendrick, of Berkeley, is managing owner.——The Encinal is reported to be producing excellent gravel.——The Ensley, at Fairplay, reports progress in development with considerable gravel in sight.—— The working force at the Douglas has been increased and work is being pushed on the adit and other underground workings. Good ore is being produced.——Several owners of small properties in the Mud Springs district are preparing to operate extensively with the advent of spring.

Placerville, January 14.

INYO COUNTY.

The Beckdolt property, at Panamint, has been bonded to Denver people and work resumed on the group.——An 8-ft. vein has been opened on the 300-ft. level of the Queen Ann mine, 2 ft. of which is high-grade ore. A 40-hp. hoist is to be installed at the property.——The Mecham & Keys Co. has sunk a 75-ft. shaft on its property south of the Old Coso mine and cut a vein, samples from which assay as high as $60 per ton.——At the old Cyty property the 5-stamp mill which was erected over a year ago is to be started next month.——The Columbia Mines Co. is to lay seven miles of pipe to bring water from the Crystal spring to its property near Darwin.

NEVADA COUNTY.

The shaft at the Nassau mine, formerly the Dana, is down 350 ft., and is opening good milling ore. Electric power has been installed to operate the hoist and compressor.——Operations have been resumed at the German mine, four miles above Washington, and the adit is being cleaned out and re-timbered. The mine has a good production record, though it has been idle for a number of years. ——Lessees working on the 800-ft. level of the Champion mine, near Nevada City, have opened a 4-ft. vein and are keeping 10 stamps dropping on the ore which averages $30 per ton. As this vein has never been opened before, its discovery will mean much to the Champion properties. The sale of the group which was supposed to have taken place some time ago, has apparently fallen through, the mine now being operated largely by lessees.——The vein has been cut on the 600-ft. level of the Union Hill mine, varying from 16 to 22 in. wide, and averaging $18 per ton. ——The work at the Central Consolidated, on Banner

mountain, continues to open good ore. The old Remington Hill channel crosses this property and development is being carried forward here as well as on the quartz vein.——George H. Hewitt has secured a bond on the old Ben Franklin mine, in the Grass Valley district, and will install new machinery.

PLACER COUNTY.

(Special Correspondence).—A 5-stamp mill has been installed at the Davenport, within the city limits of Auburn, and excellent ore is being treated. Several shoots of rich ore have been opened, and the property has been leased under a working bond to several parties. N. E. Davenport is owner.——M. Savage and associates are arranging to resume operations at the Three Queens.——It is reported that operations on the Gold Blossom will be resumed in the spring.——The 10-stamp mill at the Crater has been practically completed, and wires are being strung to conduct electricity to the plant.——The Roseville Mine, Mill & Lease Co. has been incorporated with a capital stock of $500,000 to operate in this county and $250,000 subscribed.

Zenda Mill, Amalie District.

The directors are: R. E. Nobel, T. J. Walsh, R. R. Moore, A. D. Williams, and H. G. Smith.

Auburn, January 15.

SHASTA COUNTY.

The oil-burning experimental reverberatory furnace at the Mammoth has been completed and will be started on the fine ore in a short time. The furnace is 12 ft. wide by 30 long, and is designed to make a low-grade matte and effect a better saving on ore rich in gold and silver.

SIERRA COUNTY.

The suit which has tied up the work at the Sixteen-to-One mine, at Alleghany, has been settled out of court and a new company incorporated to operate the property. At present the inclemency of the weather will prevent much work, but when the season has advanced far enough new machinery will be installed and the mine opened on a larger scale. H. L. Johnson, owner of the Tightner mine, may act as manager of the new company.——Another raise is being put up to tap the channel at the White Bear property.

SISKIYOU COUNTY.

(Special Correspondence).—The Oom Paul has arranged for the installation of a 5-stamp mill, and is considering the erection of a cyanide annex. A mill-site has been selected near the lower adit. Electricity will be the motive power. Will Pickard is manager.——The Siskiyou Syndicate is driving an adit on its holdings in Quartz valley.——At the Elk Creek a 12-in. vein of $50 ore is being mined. A 10 days' run of the 2-stamp mill recently netted $2177. At a depth of 115 ft. a new vein 15 in. wide has been cut. The company will either sink the shaft deeper or drive a lower adit to develop the new vein.——The Zarina is driving on an 8-ft. vein and running cross-cuts to other orebodies. New machinery has been installed and a force of 20 men is employed. The reservoir will be re-built in the spring.——The Scott Bar Hydraulic Co. and several other placer properties have been forced to suspend temporarily owing to snow and ice.——Arrangements are under way to sink a 500-ft. vertical shaft at the Morrison-Carloch to open the vein abandoned by the former owners. The old incline shaft has been rendered unsafe by the sliding ground.——Activities in the Blue Ledge copper district are much in evidence, although the winter storms have greatly retarded development.——The Mines Finance Co., of London, will resume the active development of its copper holdings in the Happy Camp district as soon as spring sets in.

Yreka, January 13.

TRINITY COUNTY.

W. G. Collins and A. E. Paulsen have a train of 12 mules packing high-grade ore from the Knob mine to Deadwood where it is forwarded to the Selby smelter. There are 10 tons of ore ready for shipment that assays about $700 per ton, and a large amount of lower grade opened in the stopes that will be shipped in the spring.——The La Grange, Hupp, and Union Hill mines have been closed on account of the cold weather.——Two giants are in operation at the Montezuma mine, at Junction City, and a good season's run is anticipated.

COLORADO.

CLEAR CREEK COUNTY.

(Special Correspondence).—One foot of ore containing 11 oz. gold per ton has been cut in the west drift on the Charter vein in Breckenridge mountain. Shipments are to be started at once.——Ore assaying 32.34 oz. gold and 37 oz. silver per ton has just been found on the Golden Jack vein which is being worked through the Homestake adit. The streak averages 3 in. wide. A. L. Stephens is manager.——A contract has been awarded to Thomas Randahl to drive the Prudential adit 100 ft. The bore is now in 800 ft., and from surveys the Magenta vein should be reached within a short distance. F. A. Maxwell is manager.——Work was resumed last week in the advance of the Kirkland adit on Democrat mountain. M. J. Riley, the manager, states that the adit is to be driven for 1000 ft. before any work on the veins is started.——Five carloads of electrical machinery for the Malm chemical-electro plant has been shipped from New York and is expected to arrive at Georgetown during the next week.

Georgetown, January 15.

(Special Correspondence).—A big force of men has been put to work at the Alice mine, in the Alice district. A shaft is to be sunk 100 ft., and the orebody further explored. A. H. Roller, the manager, states that work will be rushed on the 300-ton reduction plant as soon as the weather will permit.——The Resolute adit is being cleaned out and retimbered by Richard Ulrich. Ten lode mining claims are owned and all will be explored through the adit.——A contract has been awarded by the Henryln Irrigation Co. to the D. A. Camfield Development Co. for the driving of a 4-mile tunnel through the Clear Creek and Grand county range. The contract price is $4,421,500, which includes the tunnel, reservoirs, and canals. It is intended to irrigate 120,000 acres of land. A huge plant of machinery will be provided for each side of the Continental divide.——During the year 1909 the Newhouse tunnel was driven 3330 feet.

Idaho Springs, January 15.

GILPIN COUNTY.

(Special Correspondence).—William Mitchell & Sons are developing the Gulch mine and regular shipments of smelting and concentrating ore are being maintained.——For the week ended January 1, the Rocky Mountain National Bank purchased 231 oz. in gold retorts which was from the following mines: Egyptian, 95 oz.; Fifty, 87 oz.; Sleepy Hollow, 33 oz., and Baker, 16 oz.——The Champion mine, a former heavy producer, is being placed in condition for extensive operations. Last week the Trio adit intersected the vein at the eighth level, draining the entire workings of the great bodies of water.

Central City, January 14.

OURAY COUNTY.

Ore assaying 900 oz. silver and 4 oz. gold per ton has been opened on the third level of the El Mahdi mine, and shipments started to the smelter.——Jackson & Weatherly, operating the Wedge mine under lease, are shipping one car of ore per week.——Regular shipments are being made from the Black Girl mine which Fred Herzinger is operating under lease and several bodies have been blocked out that will pay well if treated in a local plant.

TELLER COUNTY.

The Strong Gold Mining Co., operating the Strong mine near Victor, shipped 50 tons of ore that assayed from $200 to $300 per ton. This is one of the richest shipments sent out of the camp. The company is mining above the water-level and taking out about three cars per day.——The production of the Vindicator Consolidated in December amounted to 3000 tons, valued approximately at $75,000. About 1300 tons of this was produced on company account, the rest by lessees.——The Pride of Cripple Creek Leasing Co. is installing an 8 by 10 in. geared hoist on the Pride of Cripple Creek claim on Ironclad hill.——Operations are to be resumed at the Blue Flag mill on Raven hill.——The Lucky Corner Mining & Leasing Co., operating the Lucky Corner mine on Raven hill, is shipping two cars per week.——A vein varying from 8 to 15 ft. in width has been opened on the 800-ft. level of the Trail mine.

IDAHO.

IDAHO COUNTY.

At the Seventeen group, near Newsome, which J. C. Hass is operating under a bond, an adit has been driven 160 ft. into the hill, a shaft sunk 100 ft., and a cross-cut driven from the bottom of the shaft to the ore.——Work is to be resumed at the Gold Medal mine, in the Elk City district, by C. E. Sample. The adit is in 200 ft. and the exploration work will be centered at this point.

KANSAS.

CHEROKEE COUNTY.

(Special Correspondence).—One of the best finds of recent weeks in the Galena camp is the ore cut by Savage &

The Missouri-Kansas Zinc Belt.

Co., who have opened 30 ft. of ore on the old Taylor Foster land, west of the city. The discovery was made in the third hole, the drill entering the ore at 60 ft., continuing to 90 ft. The Blue Mouse company a short time before cut ore on the same land, the face being 15 ft. thick.——Many operators are active on the old Templar tract. This land was a bonanza in the earlier days for shallow lead gouges and considerable pockety ore was taken out. The company is planning to drain the tract to 100 ft. next spring in order that the operators may mine the deeper zinc-levels. Some of the ore now taken out is milled at a custom plant while much is hand picked and sold in the rough without further cleaning.——The Missouri Zinc & Lead Co. has been prospecting a lease in the Cave Springs camp, and after finding good ore at different levels has bought the old Equitable mill and is ready to move it. The company will at present operate the shallow level from 75 to 100 ft., and later take up the deep levels which are similar to those of the Herald company adjoining, one of the deepest mines in the district.——McClure & Kennedy are erecting a tailing mill in the Badger-Peacock camp on the S. H. & S. lease which will be ready for operation in a few weeks. The tailing contains a fair percentage of ore. Much of the ore on this and other neighboring leases is found in underground water channels lining the roofs, floors, and walls, in large pure chunks.——The Elenita mill, the 250-ton plant recently erected by Frank Nicholson on the Murphy land, is now ready for operation.

Galena, January 14.

MISSOURI.

JASPER COUNTY.

(Special Correspondence).—Gates & Co. have reached the ore-level on the Connor land at Prosperity, in the shaft after expensive sinking and cross-cutting. The ore is rich, the entire face of the drift assaying 10 to 12%. The lease adjoins the old Victor lease which was one of the bonanzas of the district a few years ago, paying $110,000 in royalties at a time when ore sold at $20 per ton. Two drill-holes cut the ore at 217 ft., continuing for 43 ft.——The Gussie K. Mining Co., in the Duenweg camp, is working three distinct runs of ore, zinc blende, galena, and calamine, the ore occurring from 100 to 140 ft. The blende and calamine are so closely associated that the separation of the two is very difficult. The galena ore is especially rich, being free and of pockety formation.——The United Zinc and Peacock Valley Mining companies have both been very active in prospecting different tracts held by them. The Peacock company has most of its holdings in the Badger-Peacock camp, but has also been drilling leases in Prosperity, Duenweg, and Four Corners. On the Innovator tract the lease shows sheet ore at 210 ft. The United Zinc Co. is draining the drifts of the old Lincoln mine at Four Corners where a disastrous cave-in occurred some years ago, leaving much good ore in the drifts. The company is also opening a new lease nearby and has two drill-holes in ore on the McBee land, the ore showing from 80 to 100 ft. The Leckie lease also held by the company has ore at 35 ft.——The 40-acre lease of the old Troupe company, at Carterville, is being re-worked by McDonald & Henson. This land has been mined at intervals for 15 years, being a steady producer and turning in as much ore as any land in that camp.

Joplin, January 14.

MONTANA.

LINCOLN COUNTY.

The Coldflint-Keystone mines, at Sylvanite, in the northwestern part of the county in the Yahk mining district, have been sold for $75,000, and work will be started at once under the management of H. I. Reynolds. The properties have been closed for a number of years by litigation and their reopening will mean much to that portion of the county.——The Victor Mining & Milling Co., operating 11 miles north of Libby, is installing a new compressor and Pelton water-wheel. Power will be developed from the water of Granite creek which is brought to the mine under a head of 219 feet.

NEVADA.

CLARK COUNTY.

The operators east of Searchlight have formed a new mining district bordering on the Colorado river, that is to be known as the Gold Eagle mining district. Some of the properties included are the Victor-Queen Bee, Capitol, Bonnie Brae, and Oxnard-Eldorado.——Power has been turned on at the Occidental plant in the Searchlight district and the mill will be started as soon as the weather modifies enough to allow the cyanide plant to operate successfully.——Work has been resumed at the Eldorado Crown grad-

ing for the Huntington mill, which the company will bring from Capitol.——The dredge of the Colorado River Dredging Co., which proved a failure, was wrecked by the high water and the barge with its costly machinery is completely ruined.

ESMERALDA COUNTY.

(Special Correspondence).—At Rawhide there are about a dozen leases running in a half-hearted way. The people operating the Murray 10-stamp mill acquired the Victor lease and are milling the ore from that ground and the King-Heisner mill (National Mining & Leasing Co.), is milling the Truitt dump on Hooligan hill. Neither mill is in a position to cyanide the ores of the district which contain much more silver than at first suspected. Ten-dollar bullion is rare, while five is above the average. The camp is suffering from the want of a mill that can treat a low-grade gold-silver ore. This is a great drawback to the district and is seriously affecting its development.

Rawhide, January 14.

The cross-cut on the 1000-ft. level of the Clermont workings of the Goldfield Consolidated property cut the vein and it is reported that it will rival in richness the ore that made the Clermont a bonanza in the levels above.——At the Florence the mill is running smoothly, crushing from 150 to 160 tons per day, and making a saving of 40% on the plates, the pulp going to the cyanide tanks assaying about $8 per ton. In the mine the ore is being blocked out ahead of the mill and connections made with the old lease workings so the supply will be assured for some time to come.——The shaft at the Combination Fraction is down 650 ft., and will be continued to the 800-ft. point.——The Yellow Tiger Mining Co. and the Elks Leasing Co., operating in the Goldfield and Diamondfield districts, have consolidated, issued additional stock, and will probably build a mill when work on the properties is resumed. John F. Champion will manage the affairs of the company.——On the Gold Bar lease good ore has been opened on the 200 and 300-ft. levels for several hundred feet, and a carload is to be shipped to one of the Salt Lake plants to determine the most advantageous method of treatment to be installed in the mill that the lessees are to build this spring.

HUMBOLDT COUNTY.

Operations are to be resumed on the Vernon Consolidated ground, at Vernon, in the Seven Troughs district, a 15-hp. hoist, car, rails, and other equipment having been ordered.

LYON COUNTY.

The raises which are being driven at the Mason Valley mine are completed to the second level. It is expected to complete the work some time in February when the force at the mine will be doubled.——The 3-compartment shaft at the Nevada-Douglas has been completed and the work at the property will be confined to the construction of ore-bins and roads till the railroad is ready to handle freight.

NYE COUNTY.

(Special Correspondence).—The 30-stamp mill of the Tonopah Extension has been completed and the ore-crusher started in order to have the bins full when the stamps are put in operation, which will be within a few days. The ore supply will come from above the 600-ft. level, but development from the 700 down will be started immediately.——The Belmont vein in the east drift on the 1100-ft. level continues 8 ft. wide with the ore sampling $60 per ton. The width of 8 ft. continues for 100 ft., the high value occurring in the last 20 ft. of work. The ore is mainly sulphide with considerable native and wire silver occurring.——The MacNamara continues to limit shipments to one carload per day, in order that more attention may be devoted to development. Several veins, ranging from 3 to 6 ft. wide, have been opened above the 300-ft. level.——A. C. Eisen has levied an attachment on the Mayflower Consolidated for $50,320, alleged to be due him for money advanced to the company, or paid for them upon endorsement of unpaid notes to the John S. Cook bank. Eisen has also turned over the property to the Mayflower Consolidated Mining & Leasing Co. Mr. Eisen is president of both companies and used his power to make the transfer. The opposition states that the contest will be fought to a finish in the courts.——The Bonnie Clare will shortly have the new equipment installed at the mill. The company has also decided to construct a railroad from the mill to the heart of the Gold Mountain district, and will handle considerable custom ore. Eight miles of track, two locomotives, and four 10-ton side-dump cars have been purchased to equip the line from the mill to the Rattlesnake mine. Andrew J. Trumbo is general manager.——The Williams is arranging for active work.——The value of the ore shipped by the Pioneer lease in December is approximately $20,000. A shoot of ore running about $60 per ton has been cut in the new workings. It is reported that the lease may be taken over by the parent company.

Tonopah, January 15.

OREGON.

BAKER COUNTY.

(Special Correspondence).—The Oregon & Northwestern Smelting Co., in a letter dated January 8, 1910, addressed to ore and concentrate producers in this district, announces that its concentrating, smelting, and copper converting plant will be built at Homestead, Oregon, and that the company will have the plant ready for business about February, 1911. The Lewisohns are the promoters of the enterprise. Homestead is situated on Snake river and is the present terminus of the new Northwestern railroad that connects with the Short Line at Huntington, Oregon, and will eventually be built to Lewiston, Idaho. All the Seven Devils, Idaho, copper mines will be tributary to the new plant.——The local sampling works received 135,000 lb. of high-grade shipping ore today from the Highland Gold Mines Co., owning a group of promising claims on Rock creek. The property is being developed successfully for Eastern stockholders by Robert R. McGaughy.——A deal has been completed on the Golconda and Climax mines, in the Cracker Creek district, and preparations are under way to mill the Climax ore at the 20-stamp Golconda mill. B. L. McLane has been employed to overhaul the mill and machinery and put it in shape for immediate operations. F. M. Meyers, a Seattle mining man, has figured prominently in the negotiations, and William Jackson, formerly in charge of the Golconda, will be superintendent.——Considerable development work is being done on the Iron Mask Copper Co.'s group of 21 claims, near Sparta. Good copper ore is being opened in the 600-ft. adit.——The Bonanza mine, in the Greenhorn district, was recently sold at sheriff's sale for $14,000 to Frank Moore, the largest stockholder and creditor. Negotiations are now pending for the opening of the property, which is fully equipped and has 35 Risdon Iron Works stamps. The development work is to include a 1600-ft. adit that will open new orebodies at a depth of 500 feet.

Baker City, January 14.

(Special Correspondence).—The Oregon-Idaho Light & Power Co. will have finished its power-plant at Copperfield, on the Snake river, within 12 to 14 months. At this place the river makes a bend four miles long. A tunnel 1500 ft. long, 27 by 27 ft. in cross-section, has been driven, connecting the two nearest points in the bend, and obtaining a 50-ft. fall. This tunnel will carry one-third of the volume of water in the river, and will serve to develop 35,000 hp. At the upper end of this tunnel is an advantageous dam-site where a dam approximately 450 ft. long is under construction. The company has a payroll of $70,000 per month, and the work was commenced two years ago. It is stated that 75% of the plant's estimated power has been engaged by users of light and power in Oregon and Idaho, which includes mines, mills, and electric railways. The construction and engineering work is being done under contract by J. G. White & Co., and the Arnold Engineering Co., both of Chicago and New York.

Copperfield, January 15.

SOUTH DAKOTA.

LAWRENCE COUNTY.

No great change has taken place in the strike situation at Lead. The Western Federation of Miners still declares the strike in force, and the Homestake, together with the

largest operators of the district, are planning to resume work, with men who are not members of the Federation. Applicants for positions are forced to sign cards renouncing allegiance to the Federation before they can obtain work. A small force of men has been kept at work regularly in the mine and mill.

UTAH.

JUAB COUNTY.

Considerable development is being carried forward in the Chief Consolidated property in the Eureka district, and preparations are being made to install a complete plant. Walter Fitch is manager.——On the 300-ft. level of the East Tintic Development mine the company is stoping ore that assays from 10 to 30 oz. silver per ton with a good lead content. On the 500 the cross-cut is expected to open the ore any day. Three carloads were shipped recently that netted the company $2500.——Lessees in the Provo have opened a body of lead ore and are preparing to ship a carload taken out in the development work.——At the Opohongo, which is being operated through the Black Jack property, a winze is being sunk on the ore at the 300-ft. level. William Hatfield is directing the work.——The development of the American Star is being carried on through the Eagle and Blue Bell mine, and it is probable that a large working shaft will be sunk for the use of both properties, as the control of both companies is held largely by the same people.

SUMMIT COUNTY.

The cross-cut from the shaft at the New York Bonanza is in 140 ft., and is expected to open the vein at any time. A number of stringers have been cut.——At the Iowa Copper, on Scott hill, preparations are being made for the resumption of shipping. A silver-lead orebody has been opened and the bulk of the ore will be drawn from this. The company shipped some copper ore last fall, but the high freight and smelter costs were prohibitive in the transfer of low-grade ore.

TOOELE COUNTY.

The Bullion Consolidated Mines Co. has been organized to take over the Honerine Mining & Milling property, the Honerine Tunnel Mining & Milling Co., the Old Bullion Mining Co., Honerine Western Mining Co., and the Honerine Extension Mining Co. The properties are situated in the Rush mining district, near the town of Stockton, and have good records for production in the early days of the district.

AUSTRALIA.

NEW SOUTH WALES.

Prospectors at Mount Boppy have opened a quartzite lode 39 ft. wide with portions that assay as high as 40 oz. gold per ton.——Fraser & Ward obtained 108 oz. gold from 53 tons of ore taken from their Peak Hill property.——At Wyalong the reduction works are kept busy with ore from the neighboring mines. The drift on the 500-ft. level of the Golden Fleece has been extended 130 ft. south through ore a little below the average. The company crushed 17 tons of ore at the Cockle Creek plant, obtaining 44 oz. gold, and have another 20 tons ready for treatment at the same place.——A rich discovery has been made on what is supposed to be the continuation of the Victoria reef, near Drake, two feet of high-grade ore having been opened.

CANADA.

BRITISH COLUMBIA.

(Special Correspondence).—It appears evident that the year 1910 will be one of the best years that the mining industry of the Nelson district has ever experienced. Judging from the work being done as the year begins and from work planned at mines now absent from the shipping list, the coming year will be one of substantial progress. This applies to the lead-zinc mines particularly. It will mean a greater dispensation of the Dominion bounty on lead, and the possibility of a bounty on zinc being granted. The full lead bounty of 75c. per 100 lb. was payable during 1909, the total paid for the year amounting to about $340,000. The lead output showed an increase of over 1000 tons, amounting to 22,500 tons. The Sullivan group lead property will be worked extensively by the Consolidated company; a large force will work the Slocan Star; the work going on at the Big Ledge zinc deposit will, no doubt, result in heavy shipments; rumors of resumption of work on the Surprise mine at Sandon are heard; increased shipments will be made from the Richmond-Eureka by the Consolidated Co., and from the Van-Roi and Lucky Jim zinc mines.——W. J. Milne, of Vancouver, bonded the Golden Gate, Fanny, and Golden Fate claims in the Poplar Creek gold district camp. A crew of four or five men immediately started work.—— The year opens auspiciously for the Sheep Creek-Ymir district with steady production at the Queen, Nugget, and other gold properties. The Vancouver capitalists who some time ago bonded the Alma M., have permitted their lease to lapse and the property is now being worked by the owners.——It is stated that some of the coal mines in the Crows Nest district are contemplating the installation of by-product coke ovens, following German designs, which will enable them to save the by-products of the manufacture of coke by distillation.——Ore shipments from the Rossland district for the first week of the year amounted to over 5700 tons, which is above the average for the past year by nearly 1000 tons. The Centre Star, Le Roi No. 2, Ltd., and Le Roi, are shipping and work is also going on at the Velvet, Fife mines, I. X. L., and others. Resumption of work early in the spring is looked for on the Blue Bird and Hattie in the south belt and on the Jumbo and possibly the O. K. in the gold belt to the west of the camp.

ONTARIO.

(Special Correspondence).—The Kerr Lake Mining Co., of Cobalt, has increased its dividend to 50c. per share, quarterly. The public indifference to Cobalt issues continues, but there seems to be some interest growing in the reports coming in from the Porcupine mineral district, lying

Huronian Conglomerate, Cobalt District.

about 80 miles north of Cobalt. The camp is not in a silver district, but yields gold, the surface ore being evidently very rich, even allowing for a heavy discount on the tales as they come in. Ore is said to run as high as $10 per pound, and the formation is declared to show true veins, with enormous outcrops. As is always the case with new born mining camps, no language is used in describing the new finds, save the highest power superlatives.

Cobalt, January 12.

MEXICO.

SONORA.

(Special Correspondence).—The Mexico Mining, Refining & Exploration Co., which for two years has been developing its property situated 30 miles west from Hermosillo, has two veins which have been opened by cross-cuts driven from a shaft that was sunk between the veins. Some of the ore that was shipped ran high in silver, lead, and copper, with a little gold. W. T. Calderwood, the manager, states that a new boiler is being added to the steam plant, and this will enable them to increase their pumping and drilling facilities.

Hermosillo, January 13.

Personal.

Professional men are invited to send news of their engagements and travels. Such news is interesting to friends.

O. Jennings is at Parker, Arizona.

Charles Butters is at New York.

S. H. Wimberley has gone to England.

F. L. Ransome was at Boston recently.

Horace F. Evans is at Portland, Oregon.

F. W. Oldfield is in Guadalajara, Mexico.

E. H. Garthwaite has gone to New York.

J. W. Ingersol is residing at Blair, Nevada.

E. W. Carson is at Picacho Basin, California.

G. R. Easley has removed to Twin Falls, Idaho.

Llewellyn Humphreys, of Salt Lake, is in Arizona.

F. W. De Wolf was at Boston and Washington recently.

Henry B. Haigh has returned to New York from Europe.

W. B. McDougal, of Homestead, Oregon, was in Salt Lake.

J. V. N. Dorr is now at 728 Equitable Bdg., Denver, Colorado.

F. B. Reece is with the Blaisdell Syndicate at Pachuca, Mexico.

A. J. Rouix has gone to Ellora, Jersey, Channel Islands, England.

G. D. Gerson has come to Berkeley, California, from Portland, Oregon.

W. A. Kinkle has gone to the Socorro mines, Mogollon, New Mexico.

M. C. Allen has returned from Durango, Mexico, to Denver, Colorado.

S. F. Parrish has removed from Georgetown, Idaho, to Parker, Arizona.

A. H. Elftman was in San Francisco, and has returned to Tonopah, Nevada.

R. S. Chase has left Silver City, Nveada, and will reside at Masonic, California.

R. D. Skelley has gone from Round Mountain, Nevada, to Riverside, California.

S. F. Bretherton has returned to San Francisco from Shasta county, California.

Walter Harvey Weed is at Ely, Nevada, examining properties for New York clients.

Edmund Juessen was in San Francisco, and will go in a few days to Oaxaca, Mexico.

H. C. Wilmot, of New York, is in the Mormon Basin district, Malheur county, Oregon.

E. M. Hamilton has returned to Ventanas, Durango, from Lluvia de Oro, Chihuahua, Mexico.

A. E. Drucker has been visiting Cripple Creek, Colorado, and is on his way to Salt Lake City.

H. R. Norsworthy has accepted a position with the Comstock Pumping Association at Virginia City, Nevada.

Horace V. Winchell has gone to Arizona to examine the Helvetia Copper property, at Helvetia, Pima county.

Walter B. Murdock, of Pachuca, Mexico, is at New York, on his way to London, England, in the interest of the Pachuca tunnel.

C. L. Constant & Co. are to examine the Santa Rita mine in Nicaragua; R. B. Lamb, of Constant & Co., will sail from New Orleans on January 22 to conduct the work.

Philip Argall has associated his sons Philip Henry Argall and Oates Argall with him under the firm name of Philip Argall & Sons, with offices in the Majestic Bdg., Denver, Colorado.

Obituary.

F. Seymour Shewell died January 10 at his home in Hinsdale, Illinois, after a protracted illness. He is survived by a mother, wife, and child. Mr. Shewell was a valued contributor to the Mining and Scientific Press.

COMPANY REPORTS.

FEDERAL MINING & SMELTING CO. *V.* BUNKER HILL & SULLIVAN M. &. C. CO.

The following statement concerning the pending litigation in the Coeur d'Alene has been issued to the stockholders in the Bunker Hill & Sullivan company, by its president, F. W. Bradley. As presenting the point of view of that company, it will be welcomed by the public in general.

"On June 9, 1905, the Federal Mining & Smelting Co. was the owner of a claim, known as the Republican Fraction claim, a triangular-shaped piece of ground, having for one of its claimed end-lines a length of 2 ft. and its complement a length of 506.96 ft. On that date the Federal company commenced an action in the U. S. Circuit Court for the Northern District of Idaho, against the Bunker Hill & Sullivan M. & C. Co., in which action it claimed that the apex of the vein crossed these two so-called end-lines, and that they were entitled to extralateral rights. The extension of these claimed end-lines, a distance of nearly one-half mile, intersected a small portion of the orebodies of the Bunker Hill & Sullivan company in our underground workings, and challenged our right to work them. The bill of complaint asked for an interlocutory injunction and an accounting as to the value of the ores extracted within the extended extralateral claims of the Republican Fraction, claiming $2,000,000 as the value of the ore taken by the Bunker Hill & Sullivan company, and $2,000,000 more as the value of the ore remaining within the Republican Fraction extralateral claims. Application was made to the Court for an opportunity to inspect all the workings of the Bunker Hill & Sullivan company.

"The matter came up before the Federal Court, Judge Beatty presiding, and he peremptorily refused to grant them even the privilege of inspection and survey, a privilege which is invariably granted where there is the least suggestion that the plaintiff in the case has a tangible right. The Court, in rendering its opinion on this application, clearly stated that in his judgment, there was absolutely no extralateral right possible attached to the Republican Fraction claim. Having been defeated in this application, the Federal company remained quiescent for a long period of time. Subsequently, for the purpose of avoiding the force of the Federal judge's decision against the claim of extralateral right of the Republican Fraction, and getting into the State Courts, the Federal company organized a corporation under the laws of Oregon, under the laws of which State the Bunker Hill & Sullivan M. & C. Co. is organized; the new company organized by the Federal company being called the January Mining Co. The Bunker Hill & Sullivan company, and the newly created January company, being, through this strategy, made citizens of the same State, Federal jurisdiction was made impossible.

"The Federal company then caused to be conveyed to the January company, through a dummy intermediate grantee, its counsel, F. T. Post, the title to the Republican Fraction claim, so that it ultimately vested in the January Mining Co. It also transferred for a named consideration of $100, all of its causes of action against the Bunker Hill & Sullivan company by reason of trespasses alleged to have been committed. The January company then brought a suit in the District Court of Idaho, a State Court sitting in Shoshone county, upon the same cause of action as asserted in the former Federal case, and also to recover for trespasses alleged to have been committed subsequent thereto. In its complaint, the January company asks judgment against the Bunker Hill & Sullivan company for $7,300,000, apportioned as follows: $4,000,000 for damage accruing to the Federal company prior to its dummy sale to Post, its counsel; $3,000,000 for the period during which title stood in Post, and $300,000 for ore extracted after title had been transferred by Post to the January company. Prior to the January company bringing this action in the State Court, proceedings were instituted by the Federal company in the Federal Court against the Bunker Hill & Sullivan M. & C. Co., based upon the ownership by the Federal company of the San Carlos and Overlap claims. The extension of the claimed end-line planes of these two claims intersect at a distance of nearly one mile, some of the present underground workings of the Bunker Hill & Sullivan M. & C. Co., and also intersect and conflict with the extended claimed end-line planes of the Republican Fraction. It having appeared to the counsel for the Bunker Hill & Sullivan company that the organization of the January Mining Co., the taking over of the title to the Republican Fraction, and the alleged causes of action, was manifestly an attempt to evade Federal jurisdiction, the Bunker Hill & Sullivan company filed their answers in the Overlap and San Carlos cases, and set forth therein fully the action of the Federal company in transferring the title of the Republican Fraction for the purpose for which the transfer was made; that is, to avoid Federal jurisdiction; and applied to the Federal Court for an order compelling the Federal company to bring the January company into the Federal Courts; and compel it to submit to the Federal jurisdiction, in order that all controversies of interlocking extralateral rights might be there determined, that Court having first acquired jurisdiction.

"In the suit brought by the January company in the State Court, the Bunker Hill & Sullivan M. & C. Co. alleged all these facts and asked that the State Court stay its hand until the Federal Court had passed upon the question of bringing the January company into the Federal Court. The Federal company resisted this procedure on the part of the Bunker Hill & Sullivan M. & C. Co, and the matter was fully argued before the Federal Court, and on December 22 an order was made in that Court compelling the Federal company to bring the January company into the Federal jurisdiction. This order has consolidated the litigation in the Federal Court, and, through comity, the action in the State Court should be suspended abiding the event of the action in the Federal Court. From time to time, the Federal Mining & Smelting Co. has suggested that the litigation be compromised, and recently one of its officials made us a tentative offer of compromise which is now being considered."

Catalogues Received.

THE JEFFREY MFG. CO., Columbus, Ohio. Catalogue No. 69 B. 'Screens'. 24 pages. Illustrated. 6 by 9 inches. Bulletin No. 17. 'Mine Locomotives'. 68 pages. Illustrated. 7¾ by 10 inches.

The EUGENE DIETZGEN CO., San Francisco, is distributing free to the engineering profession a complete Solar Ephemeris for 1910. It contains all tables required in making solar or stellar determinations of the true meridian.

THE WESTINGHOUSE DIARY FOR 1910. A convenient vest-pocket diary containing all sorts of useful information and maps. It is issued by the Westinghouse Companies' Publishing Department at Pittsburg, Pennsylvania, and is for gratuitous distribution.

POWER & MINING MACHINERY CO., Cudahy, Wisconsin, and THE SNOW STEAM PUMP WORKS, Buffalo, New York. Catalogue No. 104. Combined catalogue of Loomis-Pettibone gas generators and Snow gas engines. It contains handsome illustrations of many gas-power installations in the United States and Mexico. 64 pages. Illustrated. 8½ by 11 inches.

Commercial Paragraphs.

The HARDINGE CONICAL MILL CO., New York, has opened a tentative branch office in room 415 Bailey Block, Seattle, Washington. V. G. Lunt is in charge.

The Needles mines and smelters have been taken over by the UNITED STATES SMELTING, REFINING & MINING CO., and will be operated as a subsidiary company under the title of the Needles Mining & Smelting Co. The Needles plant is now in the market for custom ores.

The STANDARD BRASS CASTING CO., Oakland, California, advises that its business with mining companies during the past year shows a gratifying increase. The 'Bear Brand' bronze, of which this concern is the sole manufacturer, is meeting with an unusual demand, particularly for high-speed bearings.

EDITORIAL.

OPERATIONS at the Homestake mine in South Dakota have been resumed with non-union workmen. The plant is now running at half capacity. The situation fortunately is not embarrassed by a formally declared strike, and a peaceful solution of the difficulty is anticipated.

GOLD production in the United States for 1909 has been variously estimated at from $94,560,000 to $105,000,000. The total reached by the Director of the Mint, A. Piatt Andrew, is $99.232,000. The details of his estimates are given on another page. Our own figures, made up a month ago, were evidently high, due to overestimate of the gold resulting from copper production in Arizona and Utah. It will be long before exact figures are available, but the final total is more likely to be above than below the $100,000,000 mark.

RUMORS regarding the Reclamation Service have provoked the *Engineering News* to a strong defense of that excellent organization. The Service has recently suffered considerable criticism because of certain unsatisfactory conditions due to the laws of the land rather than to the administration of the work. The attempt to force the resignation of the accomplished Director, Mr. F. H. Newell, is deservedly regarded as one to bring politics into the Service. Engineers especially should remember that clean and able service in such a position inevitably engenders opposition and the real basis of the criticism should not be overlooked.

Dividends and Speculation.

Revival of trade is world wide, with evidences of steady growth. The measure of returned prosperity in the United States is afforded by the dividend payments in January of this year which surpass all previous records. It is announced that the dividend and interest disbursements of 150 of the leading railroads, traction companies, banks, and industrial corporations have exceeded two hundred million dollars, which is an increase of twenty million dollars above the semi-annual payments by the same group in July last. In England the year has been notable for extraordinary new capital issues, aggregating $910,000,000, while in Paris there were listed new issues amounting to $735,000,000. German trade has expanded to such an extent as to create a demand for capital that has made of that country one of the greatest borrowers in the world. The German Government has likewise deliberately discounted prosperous times by again making up a budget which will produce a deficit, thus necessitating large Gov-

ernment loans. Money rates have ruled higher in Germany than in other markets for many months, and in the sense that the borrower reveals his ability to utilize other people's money better than they can apply it themselves, the Germans are becoming aggressive trustees in a great expansion of trade throughout the world. The financial situation indicates a pronounced renewal of speculative operations, which must greatly stimulate development of the mineral industry.

Utah Copper and Nevada Consolidated.

Electrolytic copper is carrying a high-potential current these days, and the transformers are growing uncomfortably hot. Mr. James Phillips, Jr., has created consternation by a letter to the stockholders of the Nevada Consolidated that is bristling with accusations. The arraignment of the Messrs. Guggenheim is perhaps the least important. The people have grown accustomed to having the financial linen of these gentlemen washed in public. The attack by the president of the Nevada Consolidated, however, elicited a response from Mr. Daniel Guggenheim, which neither denies nor affirms anything, but promises equal terms to all stockholders who may accede to the proposed plan for merging the Utah Copper with the Nevada Consolidated.

The chief public importance of the letter from Mr. Phillips is the necessity which it reveals for a re-appraisal of copper stocks. It is incumbent upon the Utah Copper, in the face of the statement now made, to show what its reserves really are, and to frankly reveal the true costs of production. Mr. Phillips concedes to that company a probable 40 million tons of ore averaging 1.5 per cent copper. Taking 70 per cent extraction as an attainable average, the total recovery would be 840 million pounds, although the present sand tailing averages about 0.6 per cent copper. At an average price for the metal of 13½ cents, and a cost of 10 cents, the visible profit would be $29,400,000. The present capitalization of the Utah Copper is 750,000 shares, selling in the early part of January at about $60. Buyers at those prices would need to see a profit of $45,000,000 in order to get their money back without interest. Tested by Inwood's Tables the present value of the shares, if they paid 5 per cent on a proper market price, with a life of 14 years for the deposit, the earnings being re-invested annually at 4 per cent, would be $26.74. The Utah Copper Company is milling not less than 8000 tons per diem, hence the above estimate is warranted, if the assumption of 40 million tons of reserves be correct. The dividend rate, on the basis of $60 per share, is 3⅓ per cent.

We believe the consolidation of the Utah Copper with the Boston Consolidated will materially improve the situation. To effect this, exchanging 2½ shares of Boston Consolidated for one share of Utah Copper, the latter company increases its capitalization to 1,198,888 shares. This, furthermore, provides for the exchange of one share of Utah Copper for 2¼ shares of Nevada Consolidated, as desired by the Messrs. Guggenheim. There would then remain 150,000 shares for improvements, and 400,000 shares to be used, according to current rumor, for the consolidation of the Garfield smelter and the Baltimore refinery with the group. This would involve carrying the dead weight of the Silver Lake Mining Company which now oppresses the Garfield enterprise.

The skewback needs to be strong to resist the thrust of this Guggenheim arch, and the distribution of strains within the arch itself is almost too complicated for calculation. On one side is the Silver Lake, depending on the Garfield smelter; next is the interesting spectacle of Utah Copper and Boston Consolidated proposing to hold each other up. On the other side is the Nevada Consolidated playing Atlas to a burdensome Cumberland-Ely. The Nevada Consolidated has a supposed total earning power, at present prices for copper, of between 50 and 60 million dollars. Its two million shares of stock, at prevailing market quotations, represent about 48 million dollars. The ore reserves are stated to be 30,000,000 tons and the recovery 33 pounds of copper per ton. The costs are stated to amount to 6½ cents per pound, and on the same basis as was used in figuring the value of Utah shares, those of the Nevada Consolidated would have a present value of $23.68 each.

In extenuation of the absorption of the Cumberland-Ely by Nevada Consolidated it must be said that this was necessitated after the initial blunder of dividing interests in the railroad and reduction works. According to the terms of the original alliance the Cumberland-Ely acquired half of the railroad, and was to assume half the cost of constructing the smelter at Steptoe, Nevada. It was further provided that if either party to the contract could not supply sufficient ore to employ its half of the capacity of the reduction works, the other could do so with its own product, paying for the extra capacity thus utilized at the rate of 7 per cent on the capital invested in the plant. The Cole-Ryan interests having bought the Giroux mines at Ely, were negotiating for the purchase of the Cumberland-Ely. This was manifestly for the sake of the extremely valuable contract with the Nevada Consolidated. Certainly they would not care to buy a mine in which the known ore reserves are understood to be largely exhausted, where the application of the caving system proved more expensive than the value of the ore could sustain, and where it seems clear that advantage was taken of a convenient miners' strike to shut down before the physical difficulties of the property should become generally apparent. In order to avoid complications that might embarrass its operations and restrict its output, the absorption of the Cumberland-Ely by the Nevada Consolidated was essential. It was a case of stock-watering in self-protection, and the Nevada Consolidated was quite strong enough to stand the dilution.

The proposed merger with Utah Copper is altogether different. As Mr. Phillips points out, there are no financial, geographic, or other good reasons for the combination. The cost of making copper will not be reduced for either party. The only result that could follow would be re-apportionment of dividends, and it is worth while to demand proof that the stock-

holders of one company will not suffer at the expense of the other in the process. Mr. Phillips shows by tables, the accuracy of which Mr. Daniel Guggenheim did not assail in his interview for the New York *Times* of January 13, that the proposal to exchange 2¼ shares of Nevada Consolidated stock for one share of Utah Copper would result in an annual loss of 61.1 cents per share for the former company, with the dividend rates at $1.50 per share for Nevada Consolidated, and $2 for Utah Copper. It is claimed, however, that the merger of the Utah Copper with its neighbor, the Boston Consolidated, will enable it to mine its higher-grade ores, bringing the average up to 1.8 per cent. This would enable it to pay $3 per share in dividends. Even on that basis the earning power of one share of Utah Copper would be 37.5 cents less than the 2¼ shares of Nevada Consolidated for which an exchange is proposed, even if the dividends of the latter should not exceed $1.50.

No valid reason appears for a coalition of these two concerns. Furthermore, an argument of no small moment, indicating the necessity for pause, is the absolute fearlessness of Mr. Phillips in accusing the Messrs. Guggenheim of having broken their engagement not to take any steps leading toward a consolidation of interests until the figures submitted by the Guggenheim engineers had been independently verified and the accounts of the Utah Copper Company submitted to the examination of auditors. Here is a public challenge which should be answered in the interest of the good name of the mining industry that can only be sustained by its leaders. The public is coming to look upon 'coppers' as a stain on the market. The miner understands that a few tons of copper will impregnate a mountain with vivid green: it seems that a similar disproportion exists between actual assets, and the copper deals that are being made in the world of high finance.

Until the value of all the properties involved shall have been set forth by engineers enjoying the public confidence, and until the financial conditions of the respective companies, and the total costs of producing copper, are demonstrated, the time is not at hand for a consolidation. At present the 'coppers' are like a train of cars; there is no more room inside; and it is expedient to call attention to the sign, 'passengers standing on the platform do so at their own risk.'

A sharp cleavage must be recognized between the financial manipulations that are bringing so many copper companies into disrepute, and the splendid technical work of such managers as Messrs. Daniel C. Jackling, C. B. Lakenan, and Lafayette Hanchette, and their able corps of assistants. In the case of 'disseminated porphyries' great problems have been met and solved. The extraction from ores containing such finely divided copper minerals has been more creditable than the world at large may realize. The fine grinding required to liberate the copper minerals produces in the pulp the most disadvantageous physical conditions for their recovery. The proved feasibility of saving from 70 to 75 per cent under such circumstances is a triumph. That financial exigencies have led to overloading the mill of the Utah Copper does not derogate from the technical ability of Mr. Jackling. The reduction of mining and milling costs, elevating porphyry with 1½ per cent of copper into the category of commercial ore, is like adding directly to the resources of the nation. This is a contribution to the wealth of America made by men of such note as Mr. Jackling and Mr. Mark L. Requa, who demonstrated the possibilities with elaborate testing plants, making sure the way to success which others might follow if willing to earn their money out of the mines rather than to win it from a manipulated market. Nevada Consolidated has been comparatively free from objectionable financial methods. The public has seen fit to discount the future more heavily than is warranted, but the management is disposed to steer an independent course. It certainly should be permitted to stand as another example of dignified and honorable mining by the side of such enterprises as Calumet & Hecla and Phelps, Dodge & Company, whose fair fame none can impeach.

Charles Benjamin Dudley.

Among the most notable men in the evolution of technical methods was the late Dr. Charles B. Dudley, whose death we chronicled in a recent issue. For thirty-four years he had been at the head of the chemical and experimental laboratory of the Pennsylvania Railroad Company, and his work had an important influence in perfecting the service of that corporation. The position which he occupied was unique. He held the confidence of the public as a scientist laboring not only to obtain an economic end for his principals, but to promote efficiency and safety in transportation, in which the people were profoundly interested. The fruits of his investigations were shown in numerous addresses and published papers which have influenced the course of other technologists here and abroad in the testing of metals, and it is not too much to say that his studies upon the characteristics of steel, begun nearly thirty years ago, revolutionized railroad construction. In the beginning his work drew upon him the hostility of the steel-makers, which was evidence enough of the need of reform in the manufacture of rails, on which depended the lives of countless thousands. Dr. Dudley is also responsible for the elaboration of the rules governing the transportation of explosives, which have been adopted by common consent of the railroads in this country, a noteworthy result when it is considered that the diversity of State legislation would have prevented the adoption of a uniform system, while the question could not well have been dealt with by Federal statute.

Dr. Dudley is a good example of the type of man who entered upon a scientific career late in life. He was twenty-nine years of age when he completed his classical course at Yale, and it was three years later when he graduated from the Sheffield Scientific School. He began life as a farmer boy in Chenango county, New York, and partly by his own labor, and partly with borrowed funds, he succeeded in making his way through college. He will long be remembered as a leader in the practical application of science in this country.

NITRATE OF SODA INDUSTRY OF CHILE.—II.

Written for the MINING AND SCIENTIFIC PRESS
By S. H. LORAM.

The assay of caliche for nitrate content is carried out as follows: 5 gm. of the ground sample is boiled in 100 c.c. of water, filtered, and the filtrate made up again to 100 c.c. To 20 c.c. of this, 10 c.c. of sulphuric acid (50° Beaumé) is added, and the mixture heated to between 70 and 80° C. in a porcelain evaporating basin; and while still maintained at this temperature over a small flame (it is convenient to stir with a marked thermometer) it is titrated with a standardized solution of about 12% ferrous sulphate, acidulated with sulphuric acid. A dark brown coloration is produced which disappears on stirring, but leaves a sage green tint to the solution, which deepens as the titration proceeds. Toward the end of the reaction effervescence is noted, and the end-point is reached when further addition of ferrous sulphate ceases to produce the brown coloration. Some little practice is necessary to be able to note the end, but once acquired, the method is rapid and correct to within 2%, which is near enough for practical purposes. Exception should perhaps be made of caliche carrying large quantities of calcium nitrate, which naturally gets reported as the equivalent of nitrate of soda. In a few of the modern plants the method is checked from time to time by more exact determinations. In the finished product for sale, the nitrate content is estimated by difference; standard must contain 95% $NaNO_3$, and the so-called refined, which is really only selected, 96% and less than 1% of NaCl. The following will give an idea of an ordinary lot:

	Per Cent.
Nitrate of soda	94.245
Nitrate of potash	1.249
Chloride of soda	1.180
Iodate of soda	0.017
Perchlorate of potash	0.239
Sulphate of magnesia	0.303
Chloride of magnesia	0.342
Sulphate of lime	0.041
Insolubles	0.174
Moisture	2.210
	100.000

The extraction of nitrate of soda from caliche depends upon its greatly increased solubility in hot over cold water, and upon the property of nitrate in hot saturated solutions of itself and common salt, of precipitating the sodium chloride and dissolving.*

*Table by M. A. Preito, showing approximately the solubility of nitrate and chloride of sodium from an excess of both salts in 100 c.c. of water at various temperatures.

Temp., deg. C.	Nitrate, gm.	Salt, gm.	Density, deg. Twaddell.
10	49.50	27.00	72.0
20	57.00	26.00	75.5
30	65.80	24.00	78.5
40	75.50	22.50	82.5
50	86.50	20.50	87.0
60	98.00	18.90	91.5
70	110.40	17.50	96.0
80	123.80	17.00	100.5
90	139.00	16.20	103.5
100	157.50	16.00	107.5
110	184.00	15.40	108.5
120	220.00	15.00	110.5

Nitrate is crystallized out of hot liquors by allowing them to cool, and the still saturated, but now cold mother-liquor, is pumped back to the boiling tanks to take up a fresh charge, by being heated with more caliche. The solution in the first stages takes up a large proportion of salt, which in turn is re-precipitated by continued heating in the presence of an excess of undissolved nitrate of soda in the caliche. Part of this goes into solution, while the salt remains behind with the solid matter, where, if present in large quantities, it is found as white crystalline masses, often in the interior of lumps of caliche, where it has replaced the nitrate. Evaporation takes place both in the boiling and crystallization tanks, but this really represents a loss, and on theoretical grounds the process could be carried out better in closed vessels.

The method of extraction is a modification of the Shank system originally used in the soda industry, and adapted to nitrate working in this country by Mr. Humberston of the Agua Santa works in 1880. Works vary in size from a productive power of 200 up to 7500 tons per month, but the output of each is limited to a certain proportion fixed from time to time for commercial reasons by the nitrate combination. At present it is 47% of the nominal power. From an engineering point of view, although working on one system there is as much difference as in capacity, from the crudest tumble-down plants, to handsome all-steel structures that make a close approach to mechanical perfection. Unfortunately, however, the latter are in the minority, and the average plant leaves much to be desired.

There is a marked absence of technical control throughout the entire industry. Some brilliant exceptions exist, and to them must be credited the advance that has been made. While the necessity of specially trained men to run the complicated modern plants is becoming more evident, as a rule the managers are drawn from the office staff. Few of the works even employ chemists. Systematic sampling of the caliche is rare, automatic machines for the purpose are not in use anywhere. The same applies to the tailing, which consists of a mixture of slime with lumps of earth, rocks, salt, etc., which would be difficult under any conditions.

In a modern works of about 5000 tons output per month, running on caliche containing 20% nitrate of soda, the method followed is: The caliche arriving in cars or carts is dumped on an inclined platform capable of holding 24 hours' supply. Quarrying and haulage are carried on only during the day, while the factory runs continuously. From this point it is passed down through one of four 24 by 16 in. Blake crushers, set to crush to about a 3½-in. ring. It then falls into tip-cars for elevation to the boiling tanks. These, 16 in number, placed side by side, are rectangular, 32 ft. long by 8 ft. wide by 9 ft. high, open on the top. They are fitted with two bottom-discharge doors, with raised inside collars, 18 in. high. An iron-plate screen, known as a 'crinolin', is set at the same height above the bottom, with openings corresponding to the collars of the discharge doors. Each tank has eight or nine turns of a 3-in. steam-coil, so placed as to divide the long section into three

nearly equal spaces. There is a so-called 'siphon' which draws from below the erinolin-plate of each tank, and discharges into the next at a height of 6 ft. above the bottom. These siphons are placed in the sides, at alternate extremities, so that the liquor passing through a series of tanks has to travel diagonally from one end to the other, as also from top to bottom. There is a pipe-connection between all the tanks and a centrifugal pump. Each has a discharge-valve for saturated solutions which draws from below the erinolin, and a bottom-discharge plug for draining the space between the erinolin and the bottom of the tank. There are also a series of three pipes for supplying cold mother-liquor, wash-water, and fresh water. Two tracks for tip-cars run across the tops of the tanks at right angles to their length, and two tracks run beneath them, one under each line of discharge doors. The caliche is treated in sets of four tanks, exclusive of two which would be discharging and filling. The process, being semi-continuous, is best shown in a simple series. Tank No. 1 we will suppose to contain fresh caliche, boiling with strongly concentrated liquor which has come through the other three tanks; heating is continued until the density reaches 105 to 115° Twaddell* varying with the caliche and the purity of the nitrate desired.

For reasons already stated the higher the density the purer will be the nitrate, but the greater the coal consumption. Steam is then shut off from the coils, and after a few minutes' settling the liquor is drawn off from below the erinolin to a discharge opening about two-thirds the way up the tank. When the level in the tank is, say, 2 ft. 6 in. below that in No. 2, which latter has caliche boiling with its second liquor of less density, the siphon between the two is opened, and No. 2 tank begins to discharge from the bottom into the upper part of tank No. 1. Siphons No. 3 and 4 are also opened, and there is a movement through the whole series. To tank No. 4 mother-liquor and wash-water are added as fast as the siphon removes the solution from the bottom. This continues until the discharge from No. 1 falls in density by addition from tank No. 2, to the lowest desirable limit, and is then stopped. The liquor will now come to rest in the four tanks at different levels according to their density, unless pumping has been resorted to to aid the siphons, as is sometimes done. After further boiling, the second liquor in tank No. 1 is run into No. 5, which in the meantime has been filled with fresh caliche and already partly heated by the coils.

Nitrate Works, Chile, Showing Boiling Tanks.

Here the liquid is again evaporated by boiling to crystallization density. No. 4, after a wash of cold fresh-water to cool the content and remove further nitrate, is ready for emptying, which is done by shoveling through the discharge-doors to tip-cars below; the tailing containing still on an average 7% nitrate. The cold-water wash is run to a sump, to serve as addition to the last tank of the series, at the next opening of the siphons, which will be No. 3; No. 1 will then receive its third liquor, and later on a fourth. In the above manner the content of each tank is submitted to four boilings in successively weaker solutions, and to one wash with fresh-water; while the liquor has been boiled four times, each in the presence of caliche containing more and more nitrate, until brought up to the required density for crystallization. The object of the perforated plate or erinolin is to equalize the circulation of liquor through the caliche, and also to form a space in which the mud and fine material may settle. Sometimes this is discharged to separate tanks for washing. The total time of treatment, filling, and dis-

*The number of degrees Twadell multiplied by 5, plus 1000, equals the weight in grams of one litre of solution. Consequently 115°T. liquor weighs 1575 gm. per litre. See also note on page 18.

charging, in about 27 hours. The strong liquor from the boiling-tanks runs to one of two settlers for clarification, where, as it cools slightly, the density increases, and more salt is thrown down. The sediment is sometimes washed for its nitrate content (often reaching 40%), but more often is thrown away. The clarified liquor is run in half-round iron channels to the crystallization tanks, of which, for the above works, there would be 100. Each is 15 ft. square, with an inclined bottom, the depth being 27 in. on one side and 33 on the other. After five days for cooling and crystallization, the mother-liquor is drawn off, and the nitrate, after shoveling to the upper part of the incline, or to special trays to drain and dry (which it does in about four days), is filled into tip-cars which run from between the lines of crystallization tanks, to dumping moles above the storage floors, where it is left until required, and is then sacked in 100-kg. bags for transport.

Steam for the coils is generated by a separate set of boilers, generally of the Lancashire type, although a few of the modern plants have multi-tubular. The steam-pressure is from 60 to 70 lb. per square inch, and as the boiling tanks are at a considerable height above the boilers, and as there is a closed circuit from the steam-dome through the coils to the boiler-feed inlet, the condensed water runs back without the aid of a pump, and circulation is continuous. Additional feed is added only to counterbalance the leakage. In the plant taken above as an illustration, three 8 by 30-ft. Lancashire boilers, which under the circumstances would generate about 150 hp. each, would be required, plus one spare unit. The power-station is separate, a duplicate set of steam-driven dynamos (one always held in reserve) providing for the crushers, pumps, elevator, light, etc., about 150 hp. The total cost-consumption would be about one-fifth to one-fourth of the nitrate output.

The working costs of one of the larger works, which serves as a good example, are as follows, items being given in pence per quintal of nitrate produced, the works running on caliche containing 24 to 25% of nitrate of soda:

	Pence.
Quarrying caliche	10.79
Transport of caliche by carts and tip-cars to railroad	5.46
Transport of caliche by railroad to works	1.40
Crushing caliche	1.40
Water	0.84
Extraction (or leaching, etc.)	8.54
Administration house expenses	0.84
General charges, administration, port-charges, etc.	4.06
Sacks, sacking, and loading on railroad cars	3.50
	36.82
Less profit in store for sale of food and supplies to workmen (truck system), 12% on 33.32d. (that is, all but sacks, etc.)	3.99
	29.33 = 2s. 5.33d.
To the above must be added railroad freight to the coast, about	4.5
Export duty	28.0
Lighterage	0.5
	33.0

Total f.o.b. about 5s. 2d. per quintal of 46 kilograms.

The extraction of iodine as a by-product is limited by the iodine combination for commercial reasons to a small proportion of the possible total, so that the process is only carried out under the most favorable conditions, in works running on caliche particularly rich in sodium iodate. The method consists in treating the mother-liquors from the nitrate crystallizing vats, which contain iodine principally as sodium iodate, and also as free iodine, and iodide, with a mixture of sodium sulphite and sulphurous acid, and is carried out as follows: the sulphite of soda is prepared by burning a mixture of nitrate of soda and coal-dust, the soda so formed is leached out, decanted, and sulphurous acid gas, made by burning native sulphur in iron stoves, is passed through to excess. To a given quantity of mother-liquor, a sufficient quantity of the above mixture is added to produce a temporary brandy coloration (due to freed iodine), and then about 25% of its volume of fresh mother-liquor, by which the iodine is precipitated; the required proportions being determined by tests made beforehand. The iodine is allowed to settle, is filtered, pressed, and the cakes so formed, which contain about 75% of iodine, are placed in about one-ton charges in iron retorts, connected with condensers made of earthenware drain-pipes about 75 cm. diam., and placed on a gentle incline. The retorts (after careful luting with clay) are gently fired until the iodine is all driven over. The aparatus is then allowed to cool for several days, after which the pipes are opened, at night on account of the lower temperature, and the iodine, now in crystals about 99.6% pure, is raked out and packed in 100-lb. barrels, which are afterward sewn in raw-hide for transport. The cost of extraction varies from 1.2 to 1.4d. per ounce, and its market value is about 5.8 pence.

The analysis of a sample of mother-liquor as used for iodine extraction is as follows:

	Grams per litre.
Nitrate of soda	342.221
Chloride of soda	103.019
Nitrate of potash	205.208
Perchlorate of potash	12.103
Sulphate of magnesia	36.565
Chloride of magnesia	37.816
Iodate of soda	3.099
Total	740.031

According to Semper and Michels, caliche was first worked in the province of Tarapacá for its potassium nitrate content by a German, Tadeo Haenke, in the year 1809, but the industry may be said to have received its great impulse at the time when the value of nitrate of soda as a fertilizer became known in Europe, about 1830. Prior to 1856 the boiling tanks had been fired direct; after that time heating by blowing steam into the liquor was introduced, with considerable economy and consequent increased production, as shown by the accompanying table. As before stated, the Shank system started in 1880, since which time it has been, with a few exceptions, the only process used.

Although the production shows a fairly steady and rapid increase, the industry has passed through a succession of 'booms' and 'slumps' consequent upon the rapid increase of production during good times, fol-

lowed by the inevitable fall in prices when the market was satisfied. With the object of avoiding this, the 'Nitrate Combination' was formed during the depression of 1884 to limit the production, and so maintain the price. This, although successful for a time, failed in the end, owing to the heavy accumulated stocks in Europe that more than counterbalanced the decreased production, and the Combination broke in 1886. It was replaced by the Permanent Nitrate Committee of London, formed with the object of making the use of nitrate more generally known, and increasing the demand. This was successful, and between 1886 and 1890 the consumption almost doubled, but the output increased more rapidly than the market, and prices again fell. A second Combination in 1891 lasted until March 31, 1894, coming to an end from want of unity between the producers.

NITRATE PRODUCTION BY YEARS.

	Spanish quintals.*
From March 1812 to January 1813.....	22,723
From March 1830 to January 1834.....	361,386
From March 1850 to January 1854.....	3,260,492
From March 1860 to January 1864.....	6,979,208
During 1870	3,943,000
During 1875	7,191,000
During 1881	7,739,000
During 1885	9,378,000
During 1890	23,373,000
During 1895	27,401,297
During 1900	31,741,293
During 1905	35,877,467
During 1907	42,840,867

*The Spanish quintal of 46 kg. is the unit used in almost all nitrate calculations; roughly 20 Spanish quintals equal 1 short ton.

After this the Nitrate Propagation Association (Asociacion Salitrera de Propaganda) was formed in Iquique and legalized by Congress in 1896. The object was to have the keeping of statistics and general furtherance of the welfare of the industry in the hands of a stable institution, independent of the Combination. It was composed of ten members of the industry from Tarapacá, and one delegate from each of the districts Tocopilla, Antofagasta, and Taltal, producers paying ⅛d. per quintal of nitrate produced to defray expenses. It still exists at present, and has been a most useful institution. Excessive production, which had begun to be noticeable after the second Combination of 1892, was made worse by the Government auction of nitrate grounds in 1894 and 1895. The third Combination was formed in 1896, with the usual object of limiting the production, and as the nominal capacity of each works was to be determined by its output during the first three months of the year, the majority of them forced their production during that time regardless of cost or efficiency. Owing to excessive stocks in Europe from the previous year, competition of ammonium sulphate, speculation, and the scare caused by the discovery that some of the nitrate carried excessive quantities of perchlorate of potash, which is detrimental to vegetation, prices fell so rapidly as to cause the worst depression known to the industry. From 5s. $11^{13}/_{16}$d. per quintal in November, 1896, prices declined to 4s. 6⅛d. in April, 1898, in spite of restricted production. The Combination ended in October, 1898, and the rest of that year and 1899 were run on free production. In October, 1899, English firms controlled the greater part of the business, and several of them, headed by Gibbs & Co., attempted to form a 'Sales Syndicate', which was to fix the total to be manufactured, arrange freights and sales—in fact, to bring the industry under one control, but the project failed. After two and a half years of depression, the fourth Combination was formed in October, 1900, for a period of five years. It was agreed that this could only be dissolved before the stated time by a majority representing 65% of the total nitrate output, the parties not only binding themselves to respect the contract, but to stipulate its continuance in case of the sale of any one of the properties. The directorate of the Nitrate Propagation Association took over the management of the Combination. It fixes, on or before May 15, the total exportation for the nitrate year beginning April 1. This figure can only be

La Democracia Works near Iquique.

altered if decided upon by a representation of at least 65% of the total, before the first week in July. It is understood that the total fixed upon shall not be less than the consumption of the previous 12 months. The quota allotted to each works in the first year was to remain constant for the following four, except the proportional decrease demanded by the starting of new works to keep a constant total. In case of a new works starting, its quota was to be fixed by three experts delegated by the Directorate, or by an arbitrator in case of difference. Should a new producer start who is not willing to enter the Combination, the Directorate has power (after a general meeting of producers) to declare the Combination at an end. If a works belonging to the Combination produces more than 15% in excess of its quota, or exports more than the amount assigned to it, the owners pay a fine of 6d. per quintal in the first case, and 18d. in the second. The Combination expenses are defrayed by a contribution of one-eighth of a penny per quintal of nitrate produced. At the end of 1901 there was a total of:

Works.	Nationality.	Quota, quintals.
48	British	20,184,000
11	Chilean	5,407,000
12	German	4,976,000
8	Spanish	3,762,000
6	Various	2,666,000
85		36,595,000

Of the above, 19 were not working, being either

permanently shut down, or closed to collect caliche. The active ones were distributed as follows: in Tarapacá 56 works, in Tocopilla 5, in Taltal 4, in Antofagasta 1.

During 1903 a craze for the formation of new nitrate companies started in Antofagasta, Aguas Blancas, and Taltal, which grew steadily to the end of 1907. Titles to ground that had been considered of so little value that the owners had tried in vain to sell it for a few hundred pesos, suddenly found a ready market, bringing thousands of pounds sterling. Locations were searched for, and either found, or titles made to fit elsewhere; companies were formed with enormous capital, prospecting was done, and elaborate reports published of the wealth that had been lying forgotten. Branch lines were extended from the trunk railroads, and works were hastily erected in such numbers that the ports and railroads were entirely unable to handle the machinery and supplies; labor became scarce and went up in price accordingly; in fact the region had the appearance of a collection of mining camps during a boom. The cause is difficult to explain. A little consideration would have pointed to the probability that the old-established companies in the districts, working with ample capital and wide-awake possibilities, would have purchased most of the ground, if valuable, when they were to be had for almost nothing, which, as a matter of fact, with few exceptions, they did. Moreover, deposits of this nature, although because of their extent costly to prospect in detail, lend themselves remarkably to rough estimation, compared to most mining ventures. But wild-cat schemes were the order of the day, the public wanted them, and there are generally plenty of persons willing to cater for such a market. When the works were nearing completion, water began to be searched for. These efforts failing, some 'water diviners' did quite a flourishing business for a time, and want of water was made one of the chief reasons for delay; but finally want of sufficient nitrate of soda had to be confessed. Now the after effects of the boom are being badly felt. It is not to be said that the whole of the companies formed during this period come under the same heading, but it may be safely stated that 80% will not return their capital, while many have already shut down. Some idea of the movement during this boom may be gathered by comparing the list of works for 1901 with that for 1908, which is as follows:

Locality.	Works.	Quota, quintals.
Tocopilla	8	6,610,000
Aguas Blancas	14	10,000,000
Taltal	15	12,075,000
Antofagasta	17	15,860,000
Tarapacá	91	39,837,000
Totals	145	84,382,000

The average cost of plant alone may be taken roughly at £1 per quintal productive-power per month. This would represent an expenditure of about £4,000,000, without taking promotion expenses, cost of ground, working capital, railway construction, etc., into account. To the above must be added 14 works in various stages of construction.

The following quotations are from a consecutive list of nitrate companies published by one of the leading papers:

APPROXIMATE HALF-YEARLY AVERAGE PRICE OF NITRATE OF SODA PER SPANISH QUINTAL, ON SHORE, DUTY PAID, SINCE 1900.

	First 6 months.		Second 6 months.	
	s.	d.	s.	d.
1900	4	11¼	5	6
1901	6	¾	6	7¼
1902	6	7	6	5¾
1903	6	5	6	11¼
1904	6	9¼	7	10
1905	7	6½	7	8
1906	7	11¼	8	10
1907	8	7	8	8
1908	7	10¼	7	6

Calculations concerning the life of the deposits, made in 1892 by Mr. Bertrand, the Fiscal Delegate, taking into consideration the annual increase at that time, set a 25-year period. Semper and Michels in 1901 calculated that at the annual output of 30,500,000 quintals, there was a stock sufficient for 44 years; at the same time stating the probability of a continually increasing demand, and consequently shorter life, partly counterbalanced by better technical work. Gandarillas and Ghigliotti, criticising the foregoing calculation, and pointing to the then rapidly developing southern districts as proof of a total stock much greater than had been reckoned, came to the conclusion that an actually measured and surveyed supply for 88 years was in existence. There was also to be predicted a much larger quantity still, that had not yet been discovered. The general failure of the new ventures brings one back, however, to the stern reality that new discoveries of great extent or value are hardly to be expected, and that attempts have already been made to work deposits too poor to pay; so that Semper and Michels' estimate of what was then considered as workable at a profit, probably is nearer the limit.

In calculations of this nature, with so many varying factors, it is difficult even approximately to foreshadow results. The present export duty on nitrate is 28d. per quintal, and constitutes the main source of revenue of the Republic. Other circumstances continuing their natural course, it stands to reason that when the deposits rich enough to bear this charge have been exhausted, the duty will have to be lowered, and as at present this is rather more than the average cost of manufacture, its reduction to half for example, would throw open to profitable handling a considerable area that is at present valueless. The same would happen through any material increase in the price of nitrate, although offset by decreased consumption and keener competition from the rapidly growing manufacture of artificial fertilizers. Improved methods of working, with an actual recovery of more than the present 60 to 70% of the nitrate content of the ground, must come into vogue before long, and will have its effect, but what the final adjustments of these and other conditions will be is for the future to decide.

Ley of an ore in Spanish signifies the gold or silver content expressed in ounces per ton, kilograms per metric ton, or otherwise.

CONSERVATION AND ALASKAN COAL.

Written for the MINING AND SCIENTIFIC PRESS
By H. FOSTER BAIN.

The coalfields of Alaska, outlined on the accompanying map (Fig. 1), lie in three separate provinces,

Fig. 1. Coalfields and Coal-Bearing Rocks of Alaska From Maps of the U. S. Geological Survey.

the Pacific slope, the central districts, and the northern region. A. H. Brooks, in discussing the subject,[1] has shown that the problems of economically developing and utilizing the coal-beds of these three areas are markedly different. Much controversy has recently arisen regarding certain of these questions in connection with the coals of the first-named province and particularly of the Bering River or Controller Bay field which lies within it. On the accompanying map (Fig. 3), prepared from data furnished by G. W. Evans, of Seattle, is shown the distribution of coal and its relations to railway surveys and harbors. In Fig. 2 the relations of the field to the copper mines and railway being built is shown. The coal lies at the end of the stub line running out from Katalla.

The 'Cunningham Claims', of which so much has recently been said, are situated east of the Kushtaka glacier and cover parts of the areas of coking and of semi-anthracite coal there shown. Adjacent are the claims of the Alaska Petroleum & Coal Co., Pacific Coal & Oil Co., the Portland-Alaska, Seattle-Alaska, and other groups which have recently attracted attention. The Bering River coalfield was discovered in 1901 by certain prospectors who were looking for petroleum. It was seemingly known before to the Indians. It lies about 1300 miles by sea from Seattle, within 12 to 25 miles of tide-water and within reach of harbors accessible the year round by protected routes of travel. The field was studied for the United States Geological Survey by G. C. Martin, and from his reports[2] and the admirable summary by Mr. Brooks already cited, the following data have been compiled.

The Bering River coalfield has been surveyed and prospected in part only. The rocks trend to the northeast, and in the unsurveyed area it is probable that there are important extensions or even additional fields to be discovered. It will be noted from the map that later surveys by Mr. Evans have already resulted in some additions to the field as at first outlined. In the known portion of the field there are at least 21.6 sq. mi. underlaid by anthracite and 22.7 by semi-bituminous and semi-anthracite coal. The coal-bearing rocks are of considerable thickness, 3000 ft. or more, and are believed to be of late Tertiary (Miocene?) age. They are closely folded and faulted, but lie in such position as to bring much of the coal above water-level. There are numerous beds of coal from 6 to 25 ft. thick. Local swellings give greater thicknesses, but the figures quoted are representative of much of the coal.

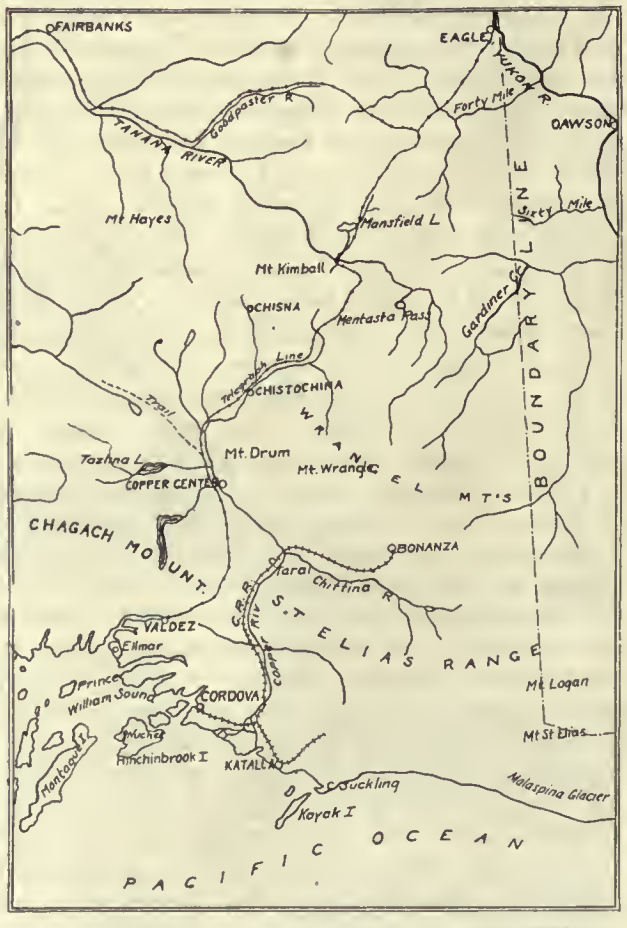

Fig. 3. Relation of Bering River Coalfield to Copper Mines and Transportation.

[1] Papers on the Conservation of Mineral Resources, U. S. Geol. Surv., Bull. 394, pp. 174-188.

[2] U. S. Geol. Surv., Bull. 225, pp. 365-382; Bull. 250, pp. 11-36; Bull. 259, pp. 140-150; Bull. 248, pp. 65-77; Bull. 314, pp. 40-46; Bull. 335.

In quality they vary from anthracite with 84% fixed carbon to semi-bituminous with 72. Some of the coal will coke, and indeed among the anomalies of the field are certain beds of natural coke so thick as to be of possible economic value. Analyses of the coals are given below:

	Moist.	Vol.	Fix. Carb.	Ash.	S.
Anthracite (average of 7 samples)	7.88	6.15	78.23	7.74	1.30
Semi-anthracite (average of 11 samples)	5.80	8.87	76.06	9.27	1.08
Semi-bituminous (average of 28 samples)	4.18	14.00	72.42	9.30	1.73

These analyses, given by Mr. Brooks, are evidently based on air-dried samples, but are none the less of value in showing that the coal has low ash and low moisture, and medium low sulphur. Mr. Martin, whose experience especially qualifies him to pass opinion in the matter, states that the coals are "higher in heating power and in purity than any other coal mines on the Pacific Coast in the United States, or the British Columbia and Australian coals."[3] The coal is conceded to be valuable for metallurgical coke, though the nature of the data on which this opinion is based is not published.

It will be seen that the field is one of large potential value, though in the attempt to give this statement more exact form there has been much misinformation and some exaggeration. Mr. Brooks has, with due reservation, estimated that in the Pacific slope coalfields of Alaska there are over 6,000,000,000 tons of workable coal. Since the Bering River and Matanuska fields are approximately equal in area it will be sufficiently accurate to assume that this tonnage is divided somewhat equally between them. It is difficult to assign any value to the coal. As is well known to all familiar with the coal industry the value of coal in the ground is but a very small part of the price at which the coal sells. In 1908 the average price of bituminous coal realized at the mine in the Unitd States was $1.14, and for anthracite $1.91. In Alaska and the Pacific Coast States, where this coal would necessarily be marketed, and where prices as compared with the rest of the country are abnormally high, it was $2.10. It is thoroughly understood also that the price of coal on the Pacific Coast at many points is artificial, and that the introduction of even a moderate amount of coal at lower prices would break the market. There can be little doubt also that for an indefinite number of years in the future, coal is likely to sell for less, rather than more in this territory. There is also question as to the capacity of the market to absorb large quantities of coal. In 1904 the total coal consumption in this trade territory, according to figures compiled by Mr. Brooks, amounted to approximately 1000 tons per day. Later figures have not been compiled except for Alaska where the consumption is now less than 200 tons per day. The Pacific Coast States absorb some, but not a great deal more coal than when Mr. Brooks made his estimates.

As there are already a number of collieries supplying this trade, it is evident that any large development of the Alaskan fields must be contingent on increased population and new industries. This is the most satisfactory sort of development, but it necessarily proceeds slowly. In the meantime interest charges mount, and against any assumed future selling price must be offset a large but unknown sum for interest on any present development. The value of the coal, however, should not be assumed at its selling price. Necessarily the cost of production and transportation, with fair profit on the money used, must be deducted. Perhaps the best measure may be obtained by a study of coal royalties. These generally, throughout the United States, run but a few cents per ton. In favorable situations, high-grade coal, easy mining conditions, and assured market, the royalty may be 10c. per ton. I have known a few cases of local mines near cities working on old leases, which paid more, and in the Eastern States limited areas of coal of value for particular uses bring more money. The average I believe to be less, though G. H. Ashley has recently concluded that 10c. may be taken as a fair value.[6]

Nevertheless, thousands of acres of excellent coal are available in areas of dense population at royalties of 3c. per ton and less, and in Illinois, as G. S. Rice has shown,[4] coal lands may be bought at prices which figure back to as little as $^1/_{13}$c. per ton for the coal in the ground. Even at these prices companies make little money and a number have been unable to pay interest on the bonds issued to secure the purchase price of the coal lands. If this is so of the value of coal lands in the midst of a big coal consuming district, with low mining costs, and with transportation already available, it is evident that the present value of coal lands in Alaska with unknown mining costs, transportation yet to be provided, and a limited and somewhat uncertain market, can not be high. Something may properly be allowed for scarcity of coal on the Pacific Coast but, as already suggested, that is probably less important than has been assumed. In the light of these data the value of $22,500,000 for one 2560-acre tract of the Cunningham claim, figured recently by the always interesting but sometimes inaccurate *McClure's*, is fanciful. This estimate is based on an evident misunderstanding of a statement made by Mr. Brooks where he was comparing the value of the coal at the pit mouth, with the corresponding values of metals produced in the territory. It is questionable whether the present value of Alaskan coal in the ground is more than of similar coal in the Middle West, and 1c. per ton would seem to be now an ample figure. I do not believe that the Conservation movement needs to be bolstered by any misinformation.

The essential features of the problem of conserving this coal supply have been put so excellently by Mr. Brooks,[5] that I can not do better than quote him verbatim.

"The conservation of the coal of the Pacific slope province is a more complex problem, both because of the high grade of some of the fuels and of their greater accessibility. While none has yet been ex-

[3]U. S. Geol. Surv., Bull. 259, p. 148.

[4]U. S. Geol. Surv., Bull. 424.

[5]Chatanooga meeting, Amer. Inst. Min. Eng., 1908.

[6]Loc. cit., p. 186.

ported, the great demand for the high-grade bituminous and anthracite coals, such as are found in the Controller Bay and Matanuska regions along the Pacific Coast, will lead to their exportation as soon as railways make them accessible. It is probable that the market for these coals will for a long time exceed the production, which will greatly stimulate mining activity once the transportation problem has been solved. When the coals are put on the market, they will probably curtail, if not entirely cut off, the demand for the lignitic and lower-grade bituminous coals which are so abundant in the Pacific Coast province of Alaska. Therefore the production of the high-grade fuels will effectually conserve those of lesser fuel value for the present. Some of these low-grade fuels, however, are so accessible and so abundant that future demands and strong competition may lead to wasteful methods of mining, provided they are all permitted to pass into unrestricted private ownership.

"The reserve of these anthracite and bituminous coals of the Pacific slope, while it can not now even be approximated, in all probability is far below that of the lignites. It seems probable that an extensive area of the high-grade fuels may be found among the mountains and glaciers to the northeast of the present known limits of the Bering River field. If such be the case, this will be another locality where the geographic conditions will prevent mining until there is far more demand for the fuel than at present. In the Matanuska there is probably also a large quantity of coal under the Quaternary coating of gravel. Making allowances for future discoveries, however, the high-grade fuel is not abundant, considering the demand for it.

Fig. 2. Bering River Coalfield from Data Supplied by G. W. Evans.

only to the extent of supplying the demand for the kind of coal which it best can furnish, then the immediate use of the coal will be legitimate and economical. But if the individual fields develop beyond the demand of their respective proper markets—if the Bering River field produces more than the needed supply for steamship, smithing, and local railway and smelting needs and of domestic anthracite, if the Matanuska produces more than is needed for its local railways and smelters, for bunker coal at its tidal terminus, and for shipment to the Pacific Coast coke-ovens, and if the coal from other fields invade these markets—there is sure to be ruinous competition, which may lead to cutting prices with the sole object of destroying all competition and establishing a general monopoly. In such ruinous competition as has existed in some of the Eastern fields the coalfields will be robbed of the more cheaply minable coal at the cost of the destruction of larger amounts which will be left in the ground so crushed and buried that it can never be recovered, coke for distant shipment will be made by wasteful processes at the mines instead of shipping the coal to points where both the coke and the by-products can be used, coal will be coked which would better be used for other purposes, and the waste by consumption en route will be extended to the Alaska coals.

"If these high-grade fuels, some of which make excellent coke, are not exploited, several conditions will probably be brought about: (1) The west coast of the United States will probably continue to draw heavily on the fuels of British Columbia, Australia, and Japan, and to the amount imported will conserve its own supply. (2) There will be an increasing demand for fuel oils, which, while it may not affect the production, will stimulate the search for new oilfields. (3) The west coast will probably continue to rely on the East for its pig iron and steel, for in the absense of good cheap coke—except as Alaska can supply it or the processes of coking coals are improved—the local supplies of iron ore will not be utilized, unless, possibly, by electrical methods of smelting. As a concomitant to this, the iron ore and coking coals of the East, which are of the most value to the nation, being nearest the centres of the population, will be correspondingly diminished. (4) What has been said of the relation these coals bear to the development of an iron industry on the Pacific Coast is to a lesser extent true of copper smelting. Without the use of Alaska coke either the copper ores will be transported to British Columbia or Puget Sound, or the coke will be brought to the copper deposits. In either case there is a loss in transportation. While it is true that these factors will affect the copper-mining industry and lead to the exploitation of only the richer deposits, yet the past few years have shown that it is economically possible to bring either the coke to the copper or the copper to the coke. (5) Certain loss of fuel in transporting Eastern coals to the west coast for certain purposes where their use is imperative will continue. This is, however, a small item, as the total tonnage of Eastern coals to the West is insignificant. (6) There will be no local supply of high-grade coals on the West Coast for the use of the navy.

"In considering the above facts it must be remembered that these Alaskan bituminous and anthracite coalfields can be made accessible only by the expenditure of a large amount of money. The millions of dollars necessary for the development of these fields will not be forthcoming unless provision be made by which a large tonnage of coal will be made available."

The difficulties it will be seen are both real and numerous. They have been intensified by the unfortunate controversy which has sprung up, but the latter may serve a useful purpose if it attracts serious attention to Alaska and its needs. The importance to the country at large of securing for Alaska as promptly as possible a vigorous and self-sustaining American population, needs no argument. This can only be accomplished by development of Alaskan resources and of the latter the minerals, here as always, are best adapted to prompt utilization because they represent concentrated value. Much can be obtained at small cost and with relatively little risk, and to tempt people into new territory liberal rewards are necessary. Undoubtedly also the simple and quick way to produce this result is by organized effort, syndicate control of special areas and deposits. The question is one of relative worth. There can be no question also that our coal-land laws are archaic and not adapted to the present situation. Indeed the present coal industry in the Western States has come in spite of rather than through their help. It is well understood that they were for years disregarded and evaded. Development of coal mines requires large expenditure, particularly in new territory. This cannot be based on small holdings and the modified law allowing 2560 acres is over restrictive rather than over generous. Present day facts and business methods should be recognized. The whole coal land law should be revised and its basis changed. Some way should be found for responsible companies to secure enough land to warrant the expenditure necessary to develop it. For myself, I believe the conditions may best be met by long-time leases, which would necessarily be at low royalties, but as to method there are legitimate differences of opinion. In the meantime rights accrued or accruing under existing laws should be scrupulously regarded and even liberally interpreted whether their holders be 'bartenders', 'laundry-men', 'Y. M. C. A. secretaries', 'politicians', or even 'capitalists'. The exact nature of those rights is clearly a matter for trial in the courts, rather than in the newspapers.

Gold is found at a number of points in the Carolinas and ajacent States. When the early Spanish explorers came to America the Indians showed them rich nuggets and ornaments of gold which came from the southern Appalachian region. At the close of the eighteenth century gold was discovered in South Carolina, and 30 years later it was found in North Carolina. In the year 1829 gold to the value of $3500 was mined in South Carolina, and from that time until the Civil War gold mining was carried on in the Carolinas with profit. The total gold production of the region has probably been about $10,000,000.

SURVEYING THE PUBLIC LAND OF THE UNITED STATES.

Written for the MINING AND SCIENTIFIC PRESS
By H. W. MACFARREN.

The method by which the public land is subdivided and marked upon the surface should be known by all miners. The prospector making his location, or holding his claims by 'possesory right', does not usually require this knowledge. In patenting a claim it is necessary that the position of the claim be accurately determined with reference to the land corners, that the Surveyor-General may be able properly to enter the claim in the plat-book; but this is the duty of the Deputy Mineral Surveyor who surveys the claim for patent. However, there will always come times when it may be desirable or necessary to locate tracts and to survey lines in the field by their markings, especially where claims conflict with or are contiguous to land held by agricultural or other title than mining patent or right. The Government is desirous that placer claims conform to legal subdivisions whenever practicable, and in such cases permits the claim to be entered for patent without further survey or plat.

The present method of surveying and subdividing the public land of the United States had its genesis in an ordinance passed in 1787, subsequent acts of Congress providing for such modification and further elaboration as changing of conditions necessitated.

As a starting point for the surveys a prominent landmark is taken in different localities as an 'Initial Point'. Through the initial point a 'Principal Meridian' is laid off, running north and south and conforming to a true meridian, and also a 'Base Line' running east and west and conforming to a parallel of latitude. The correct method of designating this initial point is to refer to the base line and the principal meridian that intersect at the point, as Salt Lake Base and Meridian, abbreviated S. L. B. & M.; though the general way is to refer to the meridian only, as Salt Lake Meridian, abbreviated S. L. M. The above is the designation of the initial point upon which the land surveys of the State of Utah are based, the initial point being in Salt Lake City. For the State of Idaho, the Boise Meridian, having its locus at Boise, Idaho, is used. California and Nevada make use of the Mount Diablo and San Bernardino meridians.

There are initiated from the principal meridian at intervals of 24 miles, east and west lines conforming to parallels of latitude, and similar to the base line. These are successively known as 'First Standard Parallel North', 'Second Standard Parallel North', 'First Standard Parallel South', etc, as these lines may be north or south of the initial point and base line. From the base line are initiated north and south lines at intervals of 24 miles, known as 'Guide Meridians'. Since all north and south lines converge toward the poles, these guide meridians are started anew from each standard parallel in contradistinction to the principal meridian which runs directly without change to the confines of the area governed thereby. These lines, though broken and displaced each 24 miles, are known and numbered successively from the principal meridian, as 'First Guide Meridian East', 'Second Guide Meridian East'.

Special base lines and meridians have been established to govern lesser areas remote from the main initial points where it was impossible or impracticable to carry the standard parallels over the mountains. The Uintah Base and Meridian, governing the northeast part of Utah, is an example. Local standard parallels or guide meridians have sometimes been established where necessitated.

The tracts, 24 miles square, are subsequently divided into 'Townships', 6 miles square, by east and west lines intersecting north and south lines. The townships in turn are divided into 36 tracts, known as 'Sections', each one mile square, and containing 640 acres; these are numbered as shown in the diagram. Only the exterior boundaries of the sections are run by the Government, but corner stones or monuments are placed each half-mile on these lines,

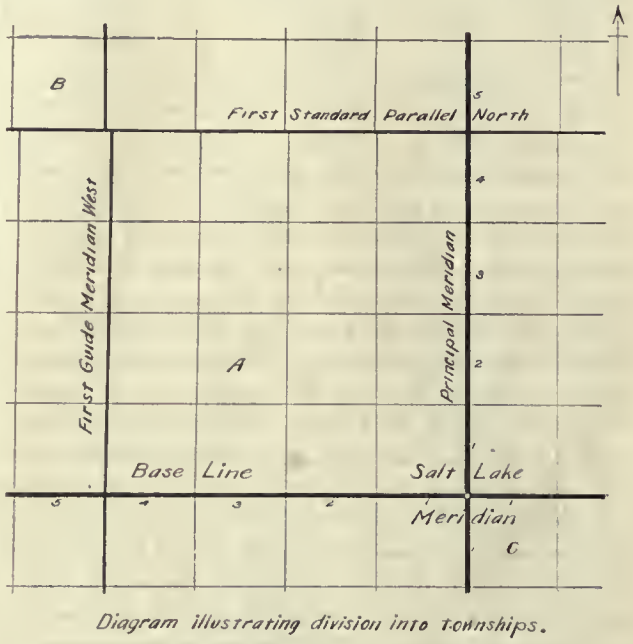

Diagram illustrating division into townships.

that the sections may be readily divided into 'Quarter Sections'. Each quarter section is held to contain four square 40-acre tracts—'Quarter-Quarters'—the smallest legal subdivision; though the Government in the case of patenting placer claims conforming to the land surveys does recognize and allow entry on 10-acre tracts, that are the regular subdivisions of these 40-acre subdivisions.

Any row, or series of contiguous townships, extending east and west, is spoken of as 'Townships', though the proper term is 'Tier', but the latter is not used. Any row or series running north and south is known as a 'Range'. A township in the first row of townships north or south of the base line and initial point or meridian is designated as Township 1 North, or Township 1 South, while a township in the second row becomes Township 2 North, or Township 2 South, etc. Similarly the rows of townships east and west of the principal meridian and the initial point are known as Range 1 East, Range 1 West, Range 2 East, Range 2 West, etc. By co-ordinating these systems of numbering, easy reference can be made to any township. In the diagram, the township designated by A is known as Township 2 North, Range 3 West, Salt Lake Meridian, and is abbreviated T. 2 N., R. 3

W., S. L. M. Likewise the township indicated by B is T. 5 N., R. 5 W., S. L. M., while C is T. 1 S., R. 1 E., S. L. M.

The method of surveying a township into sections, the exterior boundaries of the township having been run, and all monuments on these lines having been placed, is ordinarily to start from the south boundary of the township and close the survey on the east, north, and west boundaries. Starting from the southeast corner of Section 35 on the southern boundary of the township, the surveyor will run a line north, noting the topography of the country he passes over and recording the distances in chains of 66 ft., or 80 to the mile. At 40 chains, or one-half mile, he will set a rough undressed stone or a dressed post, called a 'Quarter-Section Corner'. This stone will probably be 8 by 12 in. by 2 ft. long and will be set with two-thirds to three-quarters of its length in the ground. If a post it will be 3 ft. long by 3 or 4 in. square. On a side parallel to the direction the line is being run will be chiseled '¼' if a stone, or inscribed '¼S', and the numbers of the sections it stands for, if a post. Should any trees over 3 in. be found within 20 ft. of the corner, one in each section will be marked on the side directly facing the corner by being blazed and having cut into the blaze the initials B. T. and the abbreviated section in which the tree stands. These trees are known as 'bearing trees', and are recorded in the surveyor's notes. From this corner the surveyor will continue north another 40 chains, making a full mile, where he will place a stone or post for the section corner common to sections 25, 26, 35, and 36. This monument should be set with its edges facing the cardinal points; on the east corner should be chiseled or cut one notch to denote that it is one mile from the east boundary of the township, while on the south should be one notch to indicate that it is one mile from the south boundary. If a post, it will bear in addition the sections for which it stands, and the township and range. A mound of rock will be raised beside the monument, and any suitable trees blazed as bearing-trees with the initials B. T. and the abbreviated section, township, and range, in which they stand. From this corner the surveyor will run east on a random or trial line, setting a stake for a temporary quarter-section corner at 40 chains. Running another 40 chains, and arriving on the east boundary of the township, the surveyor measures and calculates his error in bearing and distance in striking the section corner to sections 25, 30, 31, and 36, that was placed when the township boundaries were run. Returning from this corner on a true line to the corner for sections 25, 26, 35, and 36, he sets permanently, in the proper place, the quarter-section corner that was temporarily marked. From the corner for sections 25, 26, 35, and 36, the surveyor will run north one mile and east one mile, as before, and continue in this way, marking all section corners on the east and south edges with cuts or notches indicating the number of miles the monument is from the east and south boundaries of the township. The last mile on the north (between sections 1 and 2) will be run in a way similar to the east and west lines, so that the line may close on the corner already in place on the north boundary of the township. Where the north boundary of the township is a base line or standard parallel (formerly called a 'Correction Line'), the north between sections 1 and 2 will be run as a true line without reference to the corner already existing on the township boundary. A 'Closing Corner' will be set where the section line intersects the standard parallel or base line as the closing-corner of sections 1 and 2 only. This corner will bear the letters C. C. on the south, facing the township it represents, and notches or grooves to indicate the number of miles it is from the corners of the township, in this case one on the east and five on the west. This is the plan of marking section corners on township boundaries. It will be noticed that notches on these corners will always total six, and are on the opposite faces of the monuments instead of on edges adjacent and quartering toward each other, as in the case of section corners within townships. For illustration, the corner to sections 19, 24, 25, and 30 on the township boundary line will have two notches on the south face and four on the north.

All lines will be carried from the southern to the northern boundary in this way. The closing on the west boundary will be done by means of trial or random lines, just as on the north and east boundaries. Closing-corners are placed in the interior of a township only when it has been surveyed at different times, and it is impossible to close within proper limits the lines of the latter survey upon the corners of the earlier one.

A township corner is a monument marking the corner of a township. Due to the necessity of making corrections along the standard parallels to correct the convergence of the meridians or of joining old surveys to new ones, a township corner may be the corner of from one to four townships. There are certain methods of marking corners to show this or other facts, but the details would only be confusing to any but surveyors. A corner common to four townships bears six notches on each of the four corners of the post or stone. One common to two townships, or referring to one alone, is marked by six notches on two edges facing toward these townships. Township corners on base lines or standard parallels bear six grooves on three faces. Township corners that are closing township corners bear the letters C. C., and three sets of six notches. Such corners must necessarily be placed along the standard parallels when the 24-mile tracts are surveyed into townships; they also occur in joining different surveys. When it is impossible to place a corner in the proper place due to inaccessibility, a corner is placed on the line as near the proper point as practicable; this is called a 'Witness Corner', and bears in addition to the usual markings the letters W. C. Where rock is not available for a mound, pits may be dug and the earth raised as a mound. Stone monuments and mounds of rock are to be preferred to wooden posts and earth mounds, as being more substantial. Recently new corners have been adopted, being iron pipes surmounted by brass caps, similar to the bench marks of the Geological Survey. Mounds and pits will accompany them as with the old style corners. Trees should be marked by the surveyor; those intersect-

ing the line by two opposite blazes facing the directions of the line; those within a half chain by two blazes quartering toward the line. Brush should be cut to indicate the line.

By the method of surveying, all the error in measurement is thrown on the north and west boundaries of the townships; for this reason the outside quarter sections on these boundaries are reported and sold according to the measurements returned by the surveyor, the other tracts being presumed to be of full area. This error is platted into the outside tier and range of 40-acre tracts on these boundaries. These particular sub-divisions are called 'lots', and in these sections are numbered as shown in the diagram. Any tract of the 40-acre subdivision class that contains more or less than 40 acres is called a lot. Also any part of a 40-acre subdivision that may be cut off and left remaining by a piece of land, the title of which has passed from the Government, is called a lot. There can be no regularity in numbering such lots as can be seen in the case of the lots made in sections 9 and 16 of the diagram, by the issuing of patent to the group of mining claims indicated.

Though the Government does not sub-divide sections, it issues the following instructions for such procedure: First, determine the boundaries of the section by the established corners, then divide into quarter-sections by running intersecting lines from the opposite quarter-section corners. To still further reduce by dividing the quarter-sections into quarter-quarters 40-acre subdivisions), locate quarter-quarter corners at points midway between the section and quarter-section corners, likewise between the quarter-section corners and the centre of the section as determined in dividing into quarter sections. Then run intersecting lines from these quarter-quarter corners. In subdividing the quarter-sections on the last half mile of the lines closing on the north or west boundaries of the township, where the errors in measurement are thrown, the inside rows of quarter-quarters are made exact by measuring 20 chains along the section lines from the quarter-section corners, the outside rows of quarter-quarters becoming lots of various areas.

The nomenclature of the subdivision of a section is simple. In the diagram the tract indicated by *G* is the southeast quarter of section 23, abbreviated the SE. ¼ sec. 23; *E* is the west half of the southwest quarter, abbreviated the W. ½ SW. ¼ sec. 23; the quarter-quarter *D* is the northwest quarter of the northwest quarter, abbreviated the NW. ¼ NW. ¼ sec. 23; *F* is the southeast quarter of the northeast quarter, abbreviated the SE. ¼ NE.¼ sec. 23. A 10-acre placer claim conforming to legal subdivisions and situated in the extreme northwest corner of *G* would be the NW. ¼ NW. ¼ SE. ¼ sec. 23.

After completing the survey, the surveyor will file a copy of his field notes with the Surveyor-General, who binds them into a book open for inspection by all upon application. The surveyor also files a map of the township, which is open for inspection and tracing. These maps are made by entering on the plat the topography of the section lines as found in the field notes of the surveyor and connecting these according to the sketches in the surveyor's field book. The fact that the interiors of the sections are only sketched in and consequently creeks, roads, etc., are often wrongly connected or misplaced in the interior of a section, should be remembered when trying to fit the known topography of a section to the map of the same. The topography of the section lines should be accurate, and invariably is.

After the notes and plat have been filed with the Surveyor-General, the Government sends an examiner who inspects the survey, measuring a number of the lines, and endeavoring to determine if the survey has been properly made, marked, and returned. In case errors are found, the surveyor is required to return and correct his work; this frequently happens. The errors and omissions of the surveyor may consist in initiating his surveys from wrong corners, in putting up poor corners, in failing to mark his line, or in willfully neglecting to run lines or set corners in a difficult part of the country where it is expected that the surveyor will not go. Errors in measurement and alignment are sometimes found, though these should not occur since by the method of surveying there is a constant check on the work. At first, previous to the 'eighties', examinations of surveys were not made, but so many irregularities resulted, willful and otherwise, that all are now inspected. Gross irregularities are often found after a survey has been accepted, such as a corner being a quarter of a mile from its proper point, but after a survey has been accepted the corners hold and cannot be changed.

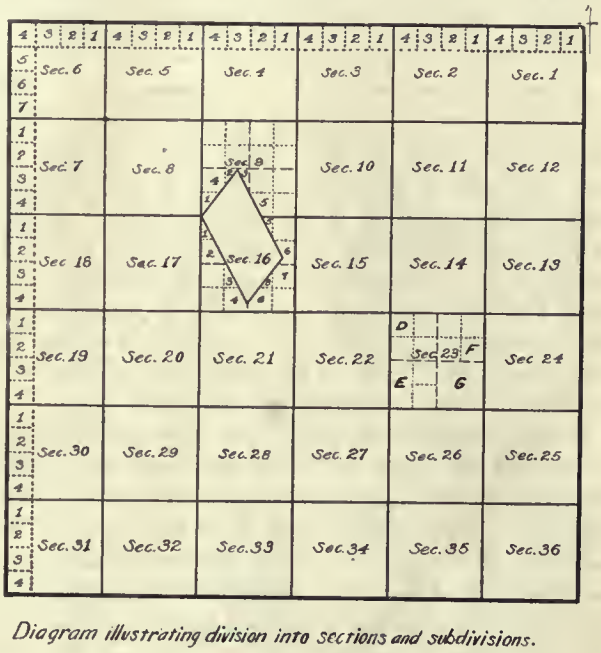

Diagram illustrating division into sections and subdivisions.

All lines do not run due north and south or east and west or the prescribed theoretical distance. Many of them vary in small amounts, and occassionally some vary greatly for a short distance. This is only done when necessary to close surveys, and is fully shown in the notes and plats.

With the passing of time the corners or monuments disappear. Men may intentionally or unintentionally remove them; cattle may tear them down; the elements and the various forces that change the surface of the earth may obliterate them. Anyone who has observed the condition of patented claim-stakes on

a steep hillside subject to much snow can understand how these corners disappear. Corners that have disappeared may be restored by running lines from existing corners in the vicinity, or a re-survey of a township or locality may be ordered to be made, starting from known corners and following the notes of the old survey. Section 57 of the United States Statutes, as revised and amended March 4, 1909, reads:

"Whoever shall willfully destroy, deface, change, or remove to another place any section corner, quarter-section corner, or meander post, on any Government line of survey, or shall willfully deface, change, or remove any monument or bench mark of any Government survey, shall be fined not more than two hundred and fifty dollars, or imprisoned not more than six months, or both."

The mounds of rock thrown up by the surveyor are usually too meagre. The requirements are that they be of 2 ft. base and 1½ ft. high; properly, they should have earth placed in the base to hold the rock together. Too often only a few stones are placed on a pile. There is a great difference between the land surveyor's corner and that of the prospector. The prospector's corner looms up large, well built, and often has a stake in the centre. The experienced man can almost instantly distinguish the prospector's corner from that of the land surveyor. It may be said without attempt to be sarcastic that the prospector is a professional 'monument builder' who takes a peculiar pride in building it in a substantial and workmanlike manner. It would be well for the land surveyor to add to his crew such a man who may be in need of recruiting his exchequer.

The Government does not hire land surveyors directly, but contracts the work, the successful bidder receiving in the past a stated amount per mile, the maximum price ranging from $9 to $25 per mile, depending on the nature of the country passed over, and the kind of line run. Since introducing the new iron corners contracts have usually been given at a rate per diem instead of per mile. A crew for surveying will consist of the surveyor in charge, who will operate the instrument, two chainmen, a head flagman, one or more brush cutters, a combined camp cook and packer, and four or five burros or mules for moving the camp. Being a case of 'more miles, more money', the work is hard and the hours long, to which the discomforts of a constantly moving camp is added. But it is interesting work, and lingers long in the memory. For the instrumentation a light mountain-transit is used, fitted with magnetic needle and with solar attachment or direct observation device. Each member of the crew carries with him several yards of white bunting which he tears into flags and attaches to poles cut from the brush. These flags are left at all corners and on high ridges as back sights, as range flags, and for triangulation points.

The stadia method, which was not officially sanctioned in earlier years, has been used lately to a considerable extent, by permission, as being more accurate and easier than chaining. It is especially valuable over rough, mountainous, or brushy land. Sights up to 1500 ft. can be taken, and with less accuracy up to 2600 ft. The objection to the use of stadia is that too little topography is taken; the sights are taken from ridge to ridge as far apart as convenient, the intervening topography being generally approximated rather than obtained by intermediate determination.

The General Land Office has been criticised because parts of the country have been long unsurveyed, and that lines have been poorly marked. It must be remembered that the task of subdividing the great area of the West is stupendous, and that the magnitude of the work and the money available will only permit it to be done gradually. Also the greater part of these surveys are made during the early settlement of a country, and it is impossible that all corners and markings should remain indefinitely. To have chiseled the letters U. S. on the monuments, and to have instructed the people to take a greater interest and to assist in preserving these corners and markings, would have been well. There is hardly a person so illiterate as not to know the meaning of the letters U. S., or so devoid of reverence or fear of the consequences as not to respect them. One of the visible indications of this is the safety that surrounds stamped parcels lying on top of a mail box, or a street car bearing the sign. "U. S. Mail" passing through a crowd of strikers. It may be mentioned that the new iron posts have inscribed on the brass caps, in addition to the usual markings, the words 'U. S. General Land Office', and the penalty for their removal.

In all communities are found men who are familiar with the surveys, but the majority are not. Many do not know in what section their land lies or the marks that definitely fix its position. The latter class often unknowingly remove or destroy the corners. Again, corners are removed by the knowing ones in order that area in excess of the rightful amount may be claimed. This is especially true in districts used only for grazing. Cases are constantly cropping up in which a party has applied for and obtained title from the Government for the tracts of land which he considers he is occupying, without looking up the markings and corners on the land. Eventually some investigator finds that the land being occupied is still open for entry and is not that to which title has been obtained, the first party having filed upon the wrong tracts, whereupon trouble ensues.

The literature bearing on the subject of public land surveys consists of a bound volume issued by the Department of the Interior, and entitled 'Manual of Surveying Instructions for the Survey of the Public Lands of the United States and Private Land Claims, 1902'. This is a book of detailed instruction for study and reference. It can be secured by unofficial applicants at cost from the Superintendent of Documents, Washington, D. C. The same Department also issues a circular for free distribution, entitled 'Restoration of Lost and Obliterated Corners and Subdivisions of Sections—Revision of June 1, 1909'. A pamphlet under the name 'The Rectangular System of United States Land Surveying', by Charles L. Du Bois, Chief of Public Surveys, General Land Office, being a re-print from the Technology Quarterly of December 1899, explains in a general and interesting way the method in use.

Discussion.

Readers of the MINING AND SCIENTIFIC PRESS are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy. The Editor welcomes the expression of views contrary to his own, believing that careful criticism is more valuable than casual compliment. Insertion of any contribution is determined by its probable interest to the readers of this journal.

Leasehold System for Mineral Lands.

The Editor:

Sir—In a recent editorial you have set forth at length the disadvantages of a leasehold system as applied to mineral lands, and especially to those containing phosphate. I think, however, that there are certain considerations to which you have not attached proper weight. Your objections are: (1) that a leasehold affords a less secure title than a fee, and (2) that the system takes from the individual locator a part of the unearned increment and therefore discourages individual initiative. As to the first it may be said that, even granting your conclusion, the objection might not be valid. As a matter of fact the cases you cite are those of short-time leases of agricultural land with 'fluctuating rental'. I am not aware that any such system has been proposed in connection with the phosphate or other mineral lands, and there is certainly a great difference between the proper appeal made in behalf of the small holding and home of the individual farmer and the large tract of rich mineral ground held by a big corporation; which happens to be the exact case in point. However, the leasehold system might afford less secure title than a fee, and yet be eminently just and proper. The advantage which it affords is that it allows all possible degrees of security to be given a title. There is all the difference in the world between the right of the 'crop farmer' in the South to raise cotton one year, and the 999-year lease of one railroad to another. To all practical purposes the latter is just as secure a title as an outright sale would give, and that it is so regarded by the business world is shown by the present price of New York Central securities. If another case need be cited, the enormous investment in buildings on leased ground in London, New York City, and elsewhere ought to remove any lingering doubt as to the adequacy of a 'leasehold' tenure.

Now it happens that there are substantial reasons why title to mineral property may justly be given, where desirable, some insecurity—that is, may properly be made contingent on the performance of specific acts or the payment of agreed sums. Mineral deposits are concentrations. They represent the gathering together of a large amount of wealth in a small space. It is impossible that they should be equally divided, and in a peculiar sense their possessors are 'trustees of the public'. This becomes a matter of first importance whenever the material is one restricted in quantity and vital to the continuance of our civilization and prosperity, as in the very instance of phosphate reserves. In such a case the necessity of preventing extortionate prices and wasteful development is paramount. The leasehold system permits this without, I am persuaded, incurring to any serious extent (to make the maximum concessions to your argument), the dangers you seem to see.

As to the second point, possible discouragement of individual initiative, I think your fears equally groundless. It is to be admitted that the proposed system will take from the possessor of phosphate land some of the unearned increment. Why shouldn't it? He is justly entitled to, and it is proposed he should have, liberal reward for his industry and the use of his capital but why should he have more? To the extent that the deposits rise in value because of increasing density of population, of decreasing abundance elsewhere, of improvements in transportation and similar factors, he, having contributed to these no more than others, is entitled to no more reward. Provision is already made in the patent office for securing to him ample rewards for any improvements in process which he may make. None of us want to discourage individual initiative. As you well say "it is too valuable an asset to be seriously jeopardized," but is not your argument really the old one that restrictive measures will frighten away capital? It sounds, at least, suspiciously like it.

The same argument was originally urged against any term-limit on street railway franchises, and yet there are now millions of dollars being invested regularly in what are virtually 'leases' of the public streets. In cases these franchises provide for the property being taken over at any time by the public, and yet the securities sell at a higher rate and are better regarded by trust companies and even the 'widows and orphans' than under the old system. However, the practical test is, does the leasing system discourage development of mineral lands?

I think no one can have had experience under it who gives an affirmative answer. Even in the case of 'short-time' leases it is notorious that resort to leasing has saved many properties at Cripple Creek and elsewhere from closing, at the same time that it has given many a good miner an otherwise impossible opportunity. Incidentally the leasing system has been the main preventive of labor troubles in Gilpin county, the production of gold from which is notoriously as regular as a Kansas wheat crop where land is held in fee. Look also at the Joplin district; it is the one place which is at once 'a poor man's camp' and a profitable district for large investments, and yet the leasing system is there universal. You admit its applicability to petroleum, but how about coal and iron? The fact that much, not to say most, of the coal mined is from leased ground does not seem to have prevented the growth of our largest mining industry. Many Lake Superior iron mines are on leased ground and, incidentally, the State of Minnesota derives a large revenue and will eventually have an enormous school fund as a result. To come still closer home, it may be well to recall that a large part of the phosphate output of South Carolina has been derived from State lands under a leasehold system, and yet the development of the territory was, if anything, too rapid. Your fears are groundless. It is entirely possible to be just to investors, and no American wants to be other than just, and yet adopt this ef-

ficient system of retaining for future generations a proper control over deposits whose wise use is fundamental to our future prosperity. I take it, that the desirability of doing so, if it can but be done justly, is beyond dispute. Long-time properly drawn leases will secure at onee adequate development and wise use; will prevent extortion; and will give to the general public some direct share in the 'unearned increment'. I put the latter last as the proposed law is not primarily a revenue matter. Theodore Roosevelt, when he made an earnest plea for the introduction of the system, specifically stated that the royalty assessed might well be purely nominal. It is control, not money, which is wanted.

The Copper Game.

The Editor:

Sir—Referring to your editorial, 'The Copper Game' in your issue of November 27, the final and most important idea comes out in the closing of the last sentence, "but meanwhile the shearers on Wall Street are busy at the old trade." The crop of suckers for 'The Copper Game' seems most abundant, when such issues as Utah Copper, with outstanding shares of over 730,000, reaches a quotation of $66 per share, or a valuation of over $48,000,000 for a property paying $1,000,000 per year in dividends. This dividend rate is but little over 2%, not so good as a first-class Government bond, and the most enthusiastic promoter or stock-seller could hardly claim that Utah Copper had security for its stock value equal to Government bonds. At the present rate of dividends, it would take an investor over 40 years to get his principal back without interest; it certainly must be that there is a good crop of suckers for 'The Copper Game'.

Another instance of the copper-crazy sucker is found in the flotation of Ray Consolidated, with a paper-value by market quotation of over $14,000,000. Even the officers of this company put the first dividend in the indefinite future. The first unit of 4000 tons capacity will not be in commission for over a year, and allowing the same margin of profit on this ore as on Utah Copper, the hoped-for dividend could not be over $500,000 per year, or practically it would take 30 years from date to get back the principal without interest. Four thousand tons per day for 30 years equals 43,800,000 tons, or much more than the rosy prospectus of this company claims is in sight. The sucker, if he bought for investment, would be lucky in dealing in either of the above stocks to get his principal back in a lifetime. Possibly the investor is to be considered as a gambler; he buys paper-values only, hoping for a rise and a chance to unload on a less-posted sucker. Some of the States have laws to prevent betting on horse races, but there is no restraint on betting on copper or any other old stock. There never was a 'fixed' horse race that could equal, for a 'sure thing' for the promoters the average of the newer great copper issues.

Los Angeles, December 17.

Who Is a Mining Engineer?

The Editor:

Sir—The discussions, frequent lately, about what constitutes a mining engineer, are leading to some clarified thoughts on the subject. Perhaps no one has yet given, or can give, a satisfactory definition. If I were to try, it would be "one who can perform any of the duties inseparably connected with mining, or who can determine when those duties are properly performed." As knowledge has increased it has become clear that the duties are so varied and many, that it is impossible for any single individual to become proficient in the performance of each and all of them; but it is possible for one to gain enough knowledge to enable him to form a correct opinion as to the merits of a performer in any one of them; in other words, to distinguish between pretense and merit.

In the schools students are taught enough mathematics to perform any of the calculations required; surveying in its various branches; metallurgical chemistry, and mineralogy; a very little practical and more theoretical mining, book-keeping, geology, metallurgy, mechanics, and physics. Just as in the classical course, no intellect can retain and digest all it studies, but the student has an opportunity to learn where to look for the things he does not know. This, in fact, is one of the best results of a college education. After graduation he takes up such specialty as his taste, or perhaps necessity, gives him. If, as a result, there are some round pegs in square holes it is only in accordance with the law of things. While I believe that the mining schools turn out a larger percentage of men fitted for their work than are turned out by the medical schools, there is something lacking in both. There are European art schools where students who do not show talent for the work are dismissed and advised to seek an occupation for which Nature has better fitted them. All technical schools need a little of that drastic weeding out. If they had it, the degree of E. M. would not be so undeserved by graduates as it is often supposed to be.

Under the definition of mining engineer above, those who are entitled to the designation are not abundant. It is not limited to those who have attended mining schools, nor to those who are really entitled to school degrees. Perhaps none are until experience has ripened their knowledge.

The suggested system of examination and licensing which is applied to medical doctors would draw the lines pretty clearly. In the case of one superintending work where human life or health are endangered, certainly the public good demands that he should be capable, and a license would do much to bar out the incapable. But should State or Government control go any farther than is required to guard health and life? Is there necessity for a law to prevent an arrant humbug from adopting a title to which he has no right, when such humbuggery deprives no one of life or health, but only of what Shakespeare calls 'trash'? Laws to prevent people from being fools have never been eminently successful.

Special Correspondence.

LONDON.

English Copper Companies.—Cape Copper.—Copiapo.—Messina.—Edmundian.—Cordoba.

At the present juncture, when copper mining is receiving close attention, it may be of interest to review the actual position of some of the English companies. In particular the fortunes of such old companies as the Cape Copper, the Copiapo, and the more recent ventures, the Cordoba, Edmundian, and Messina, are of interest.

The Cape Copper Co., Ltd., was formed in 1863 to acquire the O'okiep mine in Namaqualand, South Africa, and for many years it made handsome profits out of high-grade bornite and chalcopyrite, which was and still is shipped to Britonferry, South Wales, for treatment. John Taylor & Sons are the managers. For some time it has been known that the reserve of ore is limited, and other properties have been acquired on trial in Africa and elsewhere. The report for the past year shows a profit of £90,223, which is only one-half of the average of the last twenty years, and £50,000 less than last year. The low price of copper is accountable for most of the fall, as may be judged from the fact that two and three years ago the profits were four times as great as during last year. Another reason for the fall of profits was the strike at the Britonferry works which lasted for 13 weeks. During the year, sales of copper brought in an income of £187,914. The company owns shares in the Tilt Cove Co., of Newfoundland, and treats its ores at Britonferry. The company's profit from this source during the year was £10,661. Other items brought the income to £205,700. Mining, smelting, and investigations cost £106,736. London and other expenses brought the total cost to £115,456, leaving a balance of £90,223. Taxes also absorbed £26,148, so that the balance available for distribution was £64,075. As a large balance, £74,864, was carried forward from the previous year, it has been possible to distribute £12,375 on the preference shares, which is at the rate of 13¾%, and £82,500 on the ordinary shares, at the same rate. During the year 15,968 tons of ore assaying 15.45% was obtained from the O'okiep mine, and the reserve is calculated at 10,000 tons. The Nababeep mine yielded 54,000 tons of ore assaying 5.04%, and the reserve is 150,000 tons, practically the same figure as a year ago. Trial workings have been conducted at the Narrap, Springbok, and other mines in the district, with moderate results. Details of operations at the properties under option in America and India are not given.

The Copiapo Mining Co., Ltd., operating the Dulcinea copper mine in Chile, is not in a promising condition. This company was originally established in 1833, and for many years made good profits. Three years ago the control passed into the hands of the Siemens group, who also own the Tyee. Additional capital was subscribed with the object of developing the property and erecting a modern smelting plant. J. H. Cordner-James is chairman and L. C. Stuckey was recently appointed manager. During the year ended June 30 the amount of ore smelted was 11,374 tons averaging 8.4% copper, which produced 1343 tons of matte assaying 51½% copper, and containing also 428 oz. gold and 9766 oz. silver. Some of this ore was pyrite and some oxidized; no mechanical dressing is done, but some waste is picked out by hand. The receipts from the sale of matte were £33,631, and the loss on the year's working was £25,893. If it had not been for the action of Henrik Loeffler, one of the largest shareholders, in advancing £26,000 with practically no security, the company's finances would have been seriously embarrassed. The company has a share capital of £225,000 and a debenture issue of £50,000, no money could have been raised by temporary loans on security, so that Mr. Loeffler's course partook of the generous. Smelting is far from perfect, and the height of the blast-furnace is to be increased with a view to decreasing the consumption of coke, which is an expensive item. In June last, damage and interruption were caused by an earthquake. On June 30 the ore reserves were 21,757 tons of oxidized ore and 39,234 tons of pyrite, a total of 60,991 tons averaging 7.19% copper. The amount developed during the year was approximately equal to the consumption. The directors do not take a cheerful view of the future, and hardly hope to make a profit unless the price of copper rises.

The Messina mine, owned by the Messina (Transvaal) Development Co., Ltd., is in the northern part of the Transvaal. The company was floated in London by Chaplin, Milne, Grenfell & Co. The mine was worked in prehistoric times and is rich in chalcocite. Owing to its inaccessibility it has not yet been possible to proceed rapidly with development and production. The cost of bringing in supplies precludes for the present any scheme for smelting locally, and the cost of shipping concentrate to Swansea is excessive. The policy has therefore been to go slow, to ship sufficient high-grade concentrate to pay expenses of development, and to wait for railway connections. Last June an extension of the Pretoria-Pietersburg railway to Bandolier Kop was authorized and its construction is already well advanced. When this is completed communication will extend to Johannesburg and Cape Town. In addition another railway is being built from Komati Poort to Leydsdorp, which will complete communication with Delagoa Bay. These lines when completed will help to reduce the cost of transport. During the last year the development of the mine has been satisfactory. The rich ore has been proved to exist down to 400 ft., where a winze contains ore assaying 20% of copper. The high-grade ore reserves on June 30 have been increased to 43,315 tons having an average content of 15% copper. In addition, there are 10,000 tons of lower-grade ore, and it is safe to estimate another 60,000 tons of probable ore. During the year ended June 30, 1906 ft. of development work was done at a cost of £8471, and the high-grade ore reserves were increased by 15,533 tons. During the same period 15,011 tons assaying 12% copper were milled, yielding 2240 tons of concentrate assaying 52.3% copper, together with 1217 tons of middling product averaging 20.5%, and 56 tons of pyrite concentrate averaging 31.8%. The total recovery of copper was 80%, and the average assay value of the tailing and slime was 2½%. Of the rich concentrate 1885 tons were sold to Swansea, yielding £53,135, or £28 per ton. The cost of shipping to Swansea averages £5 17s. 6d. per ton. The cost at the mine, including development redemption, depreciation, and shipping charges, was £45,802, the London office expenses, £3805, and interest on debentures and overdrafts, £3650. The total expenses were therefore £53,257, which practically balances the receipts from sale of concentrate. The company has an overdraft at Chaplin, Milne, Grenfell & Co.'s of £42,591, and there are other creditors. It is intended when railway communications are completed to raise further capital in order to straighten finances and actively pursue operations. Though present conditions are complicated the ultimate prospect is distinctly hopeful.

The Edmundian Copper Mining Co., Ltd., belongs to the Consolidated Gold Fields group and operates a copper mine in Mozambique territory close to Rhodesia and adjoining the Beira-Salisbury railway. The copper occurs as chalcopyrite which is exceedingly friable. The content is fairly regular, but the vein varies in width. Though in many cases the average is over 15%, a lower content is used in estimating the value of the ore actually mined, 9.8% being the figure adopted at present. The ore as it comes from the mine is hand-picked on belts, rich ore being taken out on one side of the belts and barren rock on the other. The discharge from the end of the belt averages from 4 to 5% copper. It is sent to stamps, where it is crushed to pass through a screen with 300 holes to the square inch, and is afterward concentrated in an Elmore vacuum plant. The concentrate here obtained runs from 20 to 22% copper and the tailing contains about 1%. The ore and concentrate is smelted in a reverberatory, where a matte averaging 50 to 60% is obtained. The engineers have not been able to get as much work out of the crushing plant as they expected, for some reason not explained. Three air-cushion stamps are in use, each with an estimated capacity of 20 to 25 tons per day. The engineers could not get more than from 11 to 12 tons per day through each stamp, so that the

daily duty was only 35 tons instead of 60 to 70, as expected. The capacity of the reverberatory furnace has also been less than was expected. Modifications are therefore being introduced into the crushing and the smelting plants. In future the fine ore is to be removed before crushing and the coarse ore will be sent through the air-cushion stamps with a larger aperture and subsequently through a Chilean mill. In addition to the reverberatory, a blast-furnace is being erected. It will be designed to use pyritic smelting, and it will treat the slags from the reverberatory and the coarser parts of the ore. The company was formed in 1907 and operations commenced toward the end of 1908. The present report covers the nine months ended June 30. From October 1908 to June 30 the production was 569 tons of matte, which sold for £15,749. Since the latter date to the end of November the output was 400 tons of 50% matte. The expense at the mine for the nine months was £17,867, which shows a loss, but when the new crushing and smelting plants are completed, the operations should show a profit. The ore reserve on June 30 was 26,965 tons averaging 9.8% copper.

The Cordoba Copper Co., Ltd., was formed in August 1908 to acquire copper mines belonging to the Cerro Muriano and the North Cerro Muriano companies, owning properties near Cordova, Spain. The management is in the hands of John Taylor & Sons. The mining, concentrating, and smelting problems encountered at these mines have been by no means easy. A great deal of development has been accomplished lately with fairly encouraging results. On September 30 the ore reserves were figured at 122,395 tons, with an average assay of just over 3% copper. The decomposition of the country rock makes stoping difficult, and to ensure safety the workings are filled with waste immediately after stoping. During the past year 61,486 tons were raised. The preparation of these ores for smelting is not simple. About half of the production is sent to the wet-dressing plant, where 522 tons of concentrate averaging 20.9% copper and 3128 tons averaging 14.9% copper were produced. The former were sold and the latter sent to the sintering plant. There is also a magnetic separating plant where some of the crude ore and also the middling from the wet plant are treated after receiving a preliminary roast. During the period under review 19,627 tons of crude ore and 6971 tons of middling were treated and produced 3155 tons of concentrate averaging 16½% copper. Of this 124 tons were sold and the remainder sent to the sintering plant. Aside from this, 3000 tons of rich fine was sent to the sintering plant and 2326 tons was picked out and sent to the blast-furnace. At the sintering plant 8808 tons of smelting material was produced, of which 8755 tons was sent to the blast-furnace and 53 tons of return fine was briquetted. The average assay of the sintered product was 12.69%. The blast-furnace commenced operations in August 1908, and as its capacity is greater than the ore supply, it is only being worked every alternate month. During the period under review 10,489 tons of ore have been smelted, made up as follows: 2280 tons of picked ore, 8070 tons of sintered product, 74 tons of screened fine, and 65 tons of briquettes. In addition 1073 tons of slag have been re-smelted. The fluxes added amounted to 6274 tons, and the coke consumed was 2360 tons. The product of smelting was 1838 tons of matte assaying 62% copper and 69 tons of bottoms assaying 85 to 90% copper. The directors report that the magnetic process is expensive in repairs and renewals and that it is not easily kept in an efficient condition. The wet-dressing plant is not at all up-to-date, and a modern one is now being erected. The problem of concentration is far from an easy one. The ore was tried in the Elmore vacuum plant, but owing to the presence of so much calcite, the results were not satisfactory. For some months parcels of the ore have been sent to the Murex Magnetic Co.'s plant at London, and the preliminary tests have been sufficiently encouraging to warrant the erection of a small experimental plant at the mine. As regards the financial position of the company, the profit and loss account on September 30 showed receipts from sales of ore and matte of £65,102 and a total income of £76,873. Against this the expenses at the mine and in London were £73,462.

MANILA, P. I.

Mining Claims Located.—Gold Production. — Tayabas Oilfield to be Tested.—Copper Deposits.

In the fiscal year ended June 30, 1909, there was great activity in the filing of mining claims with the Bureau of Lands, according to the annual report of the director. During the year there were 656 lode and placer claims filed, and the whole number since the opening of the bureau has reached the large total of 3442. By provinces these claims are: Albay, 7 gold placer claims; Ambos Camarines, including the Paracale district, 156 lode and 99 placer gold; Benguet, 110 lode gold; Bulacan, 1 iron placer and 2 placer not stated; Ilocos Norte, 9 lode manganese; Lepanto-Bontoc, 3 lode not stated; Mindoro, 9 gold and 1 copper placer; Nueva Ecija, 4 gold placer; Rizal, 1 building stone placer; Sorsogon, including the Masbate district, 45 lode and 2 placer gold; Surigao, 32 gold placer; Tayabas, including the Tayabas oilfield, 4 lode gold and 168 petroleum placer;

Southern Philippine Islands.

Zambales, 3 asbestos placer claims. During the year 14 patents for lode claims and 5 placer patents were issued. Eighteen other claims were perfected for which patents were issued after the close of the last fiscal year. Ten additional lode claims were surveyed and advertised and were ready for patent soon after the close of the year. The period was marked by a small but steadily increasing production of gold from the lode mines in Benguet and the placers of Paracale, development work in Masbate, and activity in locating oil claims in Tayabas. During the last six months of 1909 a decided impetus has been given to mining. Three dredges are now at work in Paracale on ground averaging 50c. per yard. The Benguet mines have increased their production. Masbate gives promise of entering the list of producing districts soon and lode claims in Paracale are ready to yield returns. The Batan coal mines have now a steady output. Arrangements have been made for sinking two wells to a depth of 200 ft. on the Tayabas peninsula should oil in quantity not be found before that depth is reached. These two wells are to be sunk on what is known as the Bahay Valley Oil Co.'s property, comprising about 200 acres of some of the most promising oil ground in

the district. The best expert opinion is that the oil should be struck at a depth of from 600 to 1200 ft. The capitalization of the company is ₱100,000, divided into 1000 shares of ₱100 each, offered to the public at par.

The Mancayan mines, which are the most important and best known copper deposits in the Philippines, have lately come under the control of a local syndicate composed of American and English capitalists. This company has applied for and obtained a franchise to build a railroad from Mancanyan to Bangar, a town on the western coast of Luzon. Such a road is of prime importance to the interests of the copper company, but the gold mines of Suyoc and northern Benguet will also be benefited. The Mancayan property is now being thoroughly examined by a mining engineer from the United States. Promising specimens of the carbonate ores from eastern Pangasinan have recently been brought to Manila, but no authentic reports have yet been received concerning the extent of the deposits. Similar specimens, but more data, have been recorded from Cagayan de Misamis. Large boulders of chalcocite float carrying appreciable quantities of gold and silver have been found in Marinduque, but up to the present time the mother lode has not been discovered. Native copper occurring as a thin stringer in igneous rock has been discovered in Masbate, and rich carbonate ore carrying gold and silver have been found in the same region.

WASHINGTON, D. C.

Bills for Classifying Public Lands. — Proposed Leasing Systems. — Adverse Claimants in Alaska Get Longer Time.

Among the bills recently introduced is one by Knute Nelson, Senator from Minnesota, and chairman of the Senate Committee on Public Lands. It provides for the classification, care, and disposal of the public lands of the United States. Under its terms the President will have power at any time to withdraw from settlement, sale, or entry, any of the public lands of the country, and reserve them for forestry, water-power, irrigation, or other public purposes, and such withdrawal will remain in force until revoked by him or by an act of Congress. Mr. Nelson would separate the public lands into eight classes: agricultural, irrigable, dry-farming, timber, coal lands, mineral lands, national forest, and water-power lands. The bill provides for the disposal of these lands under the various laws with the following provisions relating to the mineral lands: "That all valuable mineral deposits other than those embraced under the head of coal lands, as defined in this act, in the public lands and national forest lands of the United States shall be free and open to exploration, and shall, together with the land requisite for the development and working of the same, be subject to location, purchase, and entry under the mining laws of the United States. In case valuable mineral deposits are found in any subdivision of agricultural, irrigable, or dry-farming lands, as defined in this Act, or in case any of the mineral lands of the United States are suitable for agriculture or grazing, only so much of the land in any subdivision shall be subject to location and purchase under the mining laws as is needed for the development and the working of the mineral deposits; and the residue of any such subdivision shall be subject to entry and disposal as agricultural, irrigable, or dry-farming land, according to the class to which it may belong. That all valuable deposits of coal, petroleum, or other mineral oil, phosphate, asphaltum, or natural gas, in the coal lands or other public lands shall be free and open to exploration and discovery. The Secretary of the Interior may, however, under such rules and regulations as he may prescribe, grant a license for a limited time, not exceeding one year, to any person to explore for such deposits in any specified public lands, not exceeding in the aggregate —— acres; and for such license the licensee shall pay a fee of not less than —— dollars per acre for the land included in such license. The license shall give the licensee the exclusive right to explore the land designated in the license during the term thereof, and shall give to him preference right to lease such of said deposits as he may have explored and discovered under his license. None of the said deposits shall be sold or disposed of; but the right to develop and work the same and to dispose of the product may be secured by lease as herein after provided. The Secretary of the Interior is hereby authorized and empowered on behalf of the United States to lease such deposits and the right to work the same and to dispose of the product thereof for a limited period, not exceeding in any case 25 years as to deposits of coal, and not exceeding 10 years as to deposits of petroleum, other mineral oil, asphaltum, phosphate, or natural gas. The lessee under such lease shall pay for coal deposits a rent and royalty of not less than —— cents per ton of the coal extracted, and not less than —— cents per barrel for petroleum, mineral oils, or liquid asphaltum extracted, and not less than —— cents per ton for asphaltum not in a liquid state, or for phosphate. In no case shall a greater amount of land be leased with the deposit than is necessary to develop and work the same, and in no case more than 2000 acres, as to coal, and in no case more than 640 acres as to the other deposits referred to in this section. The Secretary of the Interior shall determine and the lease shall prescribe the minimum development and the output to be extracted of the deposit each year during the continuance of the lease. Such lease shall also contain a covenant on the part of the lessee covenanting not to violate the provisions of an act entitled, 'An act to protect trade and commerce against unlawful restraints and monopolies', approved July 2, 1890. In case the lessee violates the said act or fails to develop the deposit and extract therefrom each year the output required by the terms of the lease, his lease shall be subject to forfeiture in a suit brought by the Secretary of the Interior. That so much of the surface of any subdivision of land containing any of the deposits, as is not necessary and requisite for developing and working the deposit shall be open to entry and sale as agricultural, irrigable, or dry-farming land, according to the class to which it may belong." Mr. Nelson has left the figures blank in the bill to give the members of the Senate an opportunity to fix them. The bill further provides that forest lands not valuable for their mineral or coal deposits, or for agricultural, grazing, or water-power purposes shall continue withdrawn and to be administered in accordance with existing laws governing the maintenance, use, and care of national forests. The bill also provides for the leasing of water-power sites for a term not exceeding 25 years at a rental not less than 1% for the first ten years, 2% for the next ten years, and 3% for the remaining five years of the gross earnings.

Frank W. Mondell, of Newcastle, Wyoming, Representative and Chairman of the House Committee on Public Lands, has introduced a bill which provides for agricultural entries upon the public coal lands, the Government reserving to itself the coal in such lands and the right to prospect for, mine, and remove it. The bill has practically been approved by the House Committee. It would affect 35,000,000 acres of coal lands already classified and as much more unclassified. The bill does not apply to Alaska. Under this bill any person obtaining a patent upon the land for agricultural purposes shall have the right to mine sufficient coal for domestic purposes until the coal is disposed of by the Government. C. I. Crawford, Senator from South Dakota, has presented a bill which provides that all public lands and lands included in national forests containing workable deposits of coal shall be classified as coal lands and disposed of by leasing, the title in fee to remain with the United States. Mr. Crawford would have the lease run 25 years, and would not grant to any one person, association, or corporation to exceed 2560 acres of coal lands, exclusive of the surface, in legal subdivisions of not less than 160 acres, which subdivisions need not be contiguous. He would require an annual rental per acre of 5% of the classified price for such lands, and in addition thereto a royalty upon the coal taken from the ground.

The statute which gives adverse claimants to mineral lands in Alaska 60 days in which to file their claims will soon be amended by the Senate in such manner as to give the claimants 90 days. A bill introduced last March by Mr. Nelson, of Minnesota, has been reported favorably by the committee on public lands. In its report, the committee

says, "It is a matter of general knowledge that during a considerable portion of each year communication by mail and otherwise between different parts of Alaska and between that Territory and the States is practically suspended. Hence it is not only possible, but probable, that a notice of an application for patent published, say, at Nome, may not be brought to the attention of claimants to the same ground residing at Juneau or in some other portions of the Territory or in some portions of the States at any time during the period of publication. This can be appreciated when it is remembered that the distance between the two Alaskan points named is, roughly stated, 1100 miles in a direct line overland, and 2200 miles by water. During the winter season there is an overland mail between certain Alaskan points, which, however, carries only letter mail. There is no doubt but that by delay of publication of mining notices until after communication on account of the season is practically closed in Alaska, unscrupulous claimants may render the requirement of mining laws in this particular ineffective, and for that reason the statutes providing for publication and the assertion of adverse claims should be amended. In fact instances have occurred where the Land Department found it necessary to suspend publication in Alaska mining cases in order to prevent injustice."

MEXICO.

Ortiz Mines in Guerrero.—Butters Copala.—Cinco Minas.—Oil Concession, Baja California.—Mexican Petroleum Company.

The Exploration Co., Ltd., of London has obtained an option on the famous mining properties of the Reforma Mining & Milling Co., at Campo Morado in the State of Guerrero. This company is practically a close corporation controlled by the Ortíz family, José M. Ortíz being president and Vicente Ortíz general manager. Due to this fact very little has ever been written about the properties, although they can well be classed among the great mines of Mexico. The area of the company's holdings is approximately 2500 acres, and the workings have a length of more than six miles. There are 14 adits, and an extensive system of development has been carried on for years. Although the actual tonnage of ore reserves is not made public, it is stated by those who have visited the mine to be enormous. There must be something great when a man with the experience of R. M. Raymond, the present managing director of the Exploration Co., is prepared to enter into a contract which calls for a payment of ₱20,000,000. The mines are about 30 miles from the railroad at Balsas, and all of the high-grade ore is packed on mule-back from the mines to Balsas station for shipment to the smelters; about 1800 mules are kept going in this service. The company had a scheme some time ago for constructing an aerial tramway from the mines to Balsas station. The oxidized ores near the surface are principally lead carrying from 750 to 5000 gm. silver and from 10 to 50 gm. gold per ton. At greater depths the ores consist mainly of iron pyrite, carrying from 3 to 8% copper, with some silver and gold.

The company is operating a concentration plant, and one 30-ton, and one 100-ton, lead-smelter. Plans have been made for the installation of a pyritic smelter. The plant is equipped with steam and electric power aggregating about 200 hp., and about 700 men are employed.

The Butters Copala Co. owns about 26,000 acres of land and practically all of the mineral claims worth having in the Copala district of Sinaloa. This has been a famous camp for over 200 years, and there should be no difficulty in finding sufficient ore to keep a large mill going, but there are persistent rumors to the effect that there is such a shortage of ore blocked that the mill has not been running at full capacity for a long time. The mill has 40 stamps and a thoroughly modern equipment, including a Butters cyanide plant. There is also a fine central steam-power station with electrical distribution of power to the mill and to the hoisting and pumping plants.

The final payment on the Cinco Minas has been made by H. E. Crawford on behalf of the Marcus Daly estate. The first payment which was made when the option was first granted was for ₱70,000, and the final payment was for ₱500,000, making a total purchase price of ₱570,000. The history of the reason for obtaining the option which has led to the final purchase of this mine reveals the value of a thorough knowledge of economic geology by a mining man of broad experience. When the former owners offered the mine for sale they thought that the bottom of the ore-shoot had been reached, and the vein had pinched, and they put the sale price of the mine on a rather high estimation of the blocks of milling ore left in the stopes, and on the possibility of a new ore-shoot being encountered. The vein is a silver-gold quartz, and has been formed in a fissure in the andesites in the hills on the south side of the Santiago River canyon. The veins occur in this district in the older andesites, and have been exposed only by the erosion of the more recent rhyolite flows which form a comparatively shallow capping in the immediate vicinity of the Cinco Minas. The fact that the main valley of the Santiago river has been eroded to fully a thousand feet below the present mine workings of the Cinco Minas would insure the ultimate permanent water-level being far below that in the mine. Mr. Crawford noticed that there were evidences of numerous small faultings in the vein, and evidences of extensive brecciation which had been re-cemented. Large zones of brecciated and leached ore were found in the lower levels, and this led to a search for the outlet of the downward percolating waters. A system of step faulting was found, and the vein continued with large and valuable ore-shoots. A winze was sunk 250 ft., which revealed the extension of a valuable body of ore.

Guanajuato.

Valuable deposits of high-grade iron ore are known to exist in the States of Colima, Michoacán, and Guerrero, and engineers representing John W. Gates have recently been making examinations of various prospects along the Pacific Coast. The Republic Development Co. of New York has been acquiring title to a number of properties recently.

Orders for two, each 55-ton, Kelly filter presses were placed with the British Mexican Development Co. of Mexico City by the Guanajuato Mining & Milling Co. for their Carmen mill. The slime from the ores treated in this mill is difficult to filter, but the results obtained from a small press erected for tests is so satisfactory that it is probable that all of the slime will be treated in Kelly presses.

A concession covering 40,000 acres of land has been granted to Flavio Gonzales to explore for coal and oil in Baja California. The land is Government property and the concession has been obtained to protect prospect work on a number of oil-seepages that have been found. New wells are continually being 'brought in' in the existing oil-fields in Mexico. In the Huasteca district the Mexican Petroleum Co. has just brought in three new wells and is now drilling two more in the same field. Tanks having a total capacity of 55,000 bbl. have been erected and are receiving the oil from the wells. From the oilfield to Tampico a pipe-line is being laid. The total distance is about 110 miles, of which about 10 miles has been completed and the material for 65 miles has been received. A narrow-gauge railroad of 130 miles will be built so as to give access to the properties.

NEW YORK.

Copper Merger Again. — Lake Copper. — Finds Rich Ore. — Santa Gertrudis Commissions.—Channing on Ray Central.

The interest in mining circles during the past week has been centered in the market. The present hysterical condition of the East, bordering as it does on a semi-panic, will undoubtedly have the effect of indefinitely postponing the large plan for a copper merger. J. P. Morgan is far too astute a reader of financial futures to attempt the flotation of a project to be equal in scope to the U. S. Steel Corporation. Copper merger plans are also halted because of complications that seem to have been unexpected. E. A. Wall, of Salt Lake, has obtained an injunction from the courts of New Jersey, temporarily restraining the merger of the Utah Copper with the Boston Consolidated. As the matter now stands the Guggenheim merger has developed into a three-cornered fight. James Phillips, Jr., is heading the Nevada Consolidated stockholders and opposing any union of Nevada Consolidated with Utah Copper, whether the latter is to include Boston Consolidated or not. Mr. Phillips' opposition is based on his contention that the terms of the proposed exchange would be a distinct loss to the Nevada Consolidated shareholders. Mr. Wall's chief argument against the merger plan is that it is contrary to the Sherman Act, and secondarily, that Utah Copper is paying too much for the other two companies. His lawsuit, viewed in this light, becomes interesting, as one of the important questions to be solved before the larger organization could be effected is whether or not it would come within the scope of the Sherman Act. It is stated here, apparently without contradiction, that the copper 'merger' would have been a fact long ago if the promoters could have been comfortably assured of a complacent attitude upon the part of the legislative and judicial authorities. There has been no drop in price so far as copper metal is concerned, but it is to be accepted as a certainty that the copper surplus must be absorbed and a price for the metal established that will show a reasonable profit for the so-called high-cost producers, before any big copper flotation can be pulled off successfully. In Boston, Lake Copper continues to be the sensation. It is now claimed that the orebody as developed by diamond-drills, will prove to be the richest vein ever opened in the Lake Superior country and possibly a richer and wider lode than any in the Calumet & Hecla. The neighboring properties of North Lake, South Lake, and the Indiana, are looked upon as having almost equal possibilities, and conservative leaders in Boston are already deprecating any wild market movement with its possible disastrous culmination.

The General Development Co. has declared a special dividend of 10%, making a total of 101½% returned as dividends since the organization of the company. Bitter complaint is heard from some stockholders of the Camp Bird, Ltd., both in this country and abroad, regarding the commissions paid on the purchase of the Santa Gertrúdis property. It appears that John Hays Hammond draws a retainer of £4000 per annum as consulting engineer for the Camp Bird. As a commission he receives about 119,000 full paid £1 shares of stock in the new Santa Gertrúdis company, and in addition receives a call on about 38,000 shares at the subscription price. Some of the stockholders think the commission is more than should be charged by an engineer in the regular employ of the company, though on the other hand it is not contended that Camp Bird lost anything on the bargain. It is conceded that the company has made a splendid purchase in acquiring the Santa Gertrúdis.

J. Parke Channing has just made a report on the Ray Central ground, in which he says that while it is impossible to determine the thickness of the orebody that has been explored on some 600,000 sq. ft. of the ground, he assumes it to be on the average 150 ft., giving a total of 90,000,000 cu. ft. of mineralized rock, which, as estimated at 12 cu. ft. per ton, would make a total of 7,500,000 tons of developed ore. Mr. Channing states that he feels safe in assuming that this ore will average 2% in copper content. These figures would give Ray Central a possible profit of $12,000,000 to $15,000,000.

DENVER, COLORADO.

Conditions in the San Juan District. — Cripple Creek News. — Property Transfers.—Clear Creek. — New Process.

Mining throughout the State has been hampered thus far by the severity of the weather. The outlying camps are practically isolated. The Denver & Rio Grande railroad from Durango to Ouray was blocked from December 31 until January 10. Many families in Ouray suffered from the cold, as the local coal dealers had only a small supply of coal on hand. The business men of the town raised nearly $300 to help the railroad get the tracks cleared. To add to the difficulty, warm weather was experienced from January 3 to 6 which caused slides to run in nearly every gulch in the district. All Western Union, railroad, and telephone wires connecting Silverton with Durango were down. The canvas plant at the Iowa-Tiger mine was completely wrecked and some damage done to the main mill, necessitating a temporary shut-down. Eight men in all have been reported as lost in the slides. The Silverton, Gladstone & Northern railroad, connecting the Gold King mine with Silverton, has been leased to Otto Mears.

Ore-hauling and all surface work in the Cripple Creek district was at a standstill during the first part of the month. Teams were kept busy delivering coal. All pipelines supplying compressed air were frozen. There is a persistent rumor that the Golden Cycle & Milling Co.'s holdings are to be sold to the Consolidated Gold Fields of South Africa, Ltd. At the annual meeting of the Cripple Creek District Mine Owners & Operators Association, the old officers were re-elected. The association is waging war on high-graders and operators of 'fences'. It is estimated that $250,000 was lost to the owners and operators last year by petty thieving. James F. Burns has secured control of the Jennie Sample Consolidated Mining Co. by purchase of 60,000 shares from S. S. Bernard. Howard Masterson has been elected president. The Portland Gold Mining Co. paid its regular quarterly dividend of 2c. per share on January 15. The Vindicator Consolidated Gold Mining Co. has announced its quarterly dividend of 3c. per share payable on January 25. The Deep Drainage Tunnel is in softer rock and is advancing rapidly. The heading is now within the lines of the Beacon Consolidated Mining Co.'s holdings on Beacon hill. Several transfers of property have taken place since the first of the year. The old Buell mine in Gilpin county has been sold to the U. P. R. Mining & Milling Co. This mine has a recorded production of $2,000,000. The mill is to be remodeled and equipped to treat the lower grades of ore. The sheriff's sale of the property of the Golden Dale Mining & Milling Co. on Raven hill in the Cripple Creek district has been adjourned until January 29. The sale is to satisfy a judgment of $3295.

The success of the Newhouse tunnel has made similar projects look more hopeful. There are now six tunnels boring into Saxon mountain near Georgetown. It might not be amiss to suggest that a consolidation of tunnel interests in such a case would mean a great saving in time and money. The Newhouse tunnel was driven 3332 ft. during 1909. More than 15,000 ft. of lateral has been driven from this tunnel. Work at the face has been stopped until about March 1. The Stanley mine on Spanish bar just above Idaho Springs has been balled out to the third level and is now shipping. The placer operators on the creek bank below the mine are doing well. The Malm dry chlorination mill being erected at Georgetown is progressing slowly, because the material and machinery cannot be secured as rapidly as expected. The Colorado Springs and Denver daily papers have recently given some space to heralding a new process for extracting gold from so-called ore from the Front Range. The story goes that an expert chemist living near Woodland Park has discovered this process. A quotation from one of the articles may serve to illustrate. "The acid he has invented is a neutral one, and its chief value lies in the fact that it saves the flour gold. In other words, the acid when poured over the ore to be tested sets free the volcanic gases, whereas in ordinary methods where fires are first used the flour gold is lost in freeing the volcanic gases."

General Mining News.

ARIZONA.

COCHISE COUNTY.

The shaft at the Copper Queen property at Courtland is down 150 ft. It is the intention of the company to sink to the 200-ft. level and connect with the first shaft that was sunk on the property, a distance of 900 ft.——New cages have been installed at the property of the Great Western Mining Co., and new ore-cars purchased. Good ore has been opened on the lower level of the Mary shaft and the company is erecting living quarters for the men in anticipation of a considerable increase in the force employed.——The Red Mountain Development Co., operating at Dragoon, opened a body of sulphide ore in the shaft at a depth of 60 ft., and is planning on installing power and hoisting machinery. Frank Briggs is manager.——At Paradise the California & Paradise company is erecting a hoist preparatory to more extensive development.

GILA COUNTY.

(Special Correspondence).—The Williams shaft of the National Mining Exploration Co. has cut a new formation at a depth of 500 ft., and is now in material consisting largely of hematite that contains a small amount of copper. It is believed that the new formation may prove to be the main orebody which the shaft is expected to open. H. W. Woodward, the superintendent, is employing 25 men.——A force of 350 men is employed by the Arizona-Commercial Copper Co. in underground, surface, and smelter work. The sixth level is yielding most of the commercial ore, but on the fourth and fifth levels also valuable copper deposits are opened. Two winzes being sunk from the sixth level between the Eureka and Black Hawk shafts are down 75 ft. Both of these follow the vein at an angle of about 63° and have been in ore continuously. The amount of ore for the smelter has been slightly increased, so that the output of fine copper for January should be nearly 500,000 lb.——The 200-ton ore-bins at the McGaw shaft are completed, and the railway spur from the Arizona-Commercial smelter to the McGaw is practically done, so that the Superior & Boston Copper Co. is in readiness to ship ore. The date for beginning shipments has not yet been set but when production has once begun no less than 50 tons per day will be sent to the smelter.——The cross-cuts north and south on the 500-ft. level of the Telfair shaft of the Arizona-Michigan property are about 400 ft. long, the north being in quartzite containing some manganese and the south in diabase. Work has been discontinued temporarily on the drifts running east and west from the north cross-cut at a distance of 130 ft. from the shaft, because the vein followed is narrowing and contains little mineral of any kind. The formation in the face of the north cross-cut indicates the proximity of the Dewett lode.

Globe, January 21.

GRAHAM COUNTY.

At the Gold Belt property, in the Clifton-Morenci district, the new 5-stamp mill has been running about a month with excellent results. The cross-cut on the 100-ft. level has opened the vein showing it to be 10 ft. wide with an average value of $10 per ton.——The ore from the Standard mine is now being shipped to the Shannon smelter instead of the Detroit Copper plant as in the past.——The Copper Mines Co. of Arizona has been re-organized as the Arizona Morenci Copper Co. The company owns 100 claims in the Clifton-Morenci district and at present is prospecting the Celtic group with two churn-drills.

MARICOPA COUNTY.

The east incline of the Vulture Mines Co., at Vulture, has been retimbered to a depth of 275 ft. and will soon be completed. A connection has been made between the two shafts giving better ventilation and good ore opened on the No. 6 level. The mill has been kept running steadily on ore that assayed from $8.50 to $11.50 per ton and by April 1, the company will have the new mill in operation which will greatly increase the milling facilities. A second artesian well is being drilled and a cold-storage plant is under construction.——George Margaretic is preparing to forward a shipment of ore from the Unida mine to the Humboldt smelter when it resumes operations about the first of March.

PIMA COUNTY.

The shaft of the Chesterfield company near Tucson is down 330 ft. and the cross-cut on the 200-ft. level has opened a body of shipping ore. The company is preparing to open the ore on the 300-ft. level and expects to be shipping by May 1.——The Pontotoc mine, 8 miles northeast of Tucson, which has been idle for a year, is being unwatered and operations will be resumed on a larger scale. Duran Daily is superintendent.——A new hoist has been installed at the Old Growler mine and the company will sink to the 500-ft. level.——An extensive report has been made on the Gould mines 18 miles west of Tucson and the company is contemplating the erection of a smelter.

YAVAPAI COUNTY.

Considerable activity has been manifest in the Big Bug district since the announcement that the Humboldt smelter would resume operations about March 1. B. S. Bowen, manager for the Humboldt Consolidated Mines Co., is to purchase a hoist and power-plant for the company's property near McCabe. A new shaft has been started on one of the claims and as soon as the hoist can be installed, the ground will be thoroughly prospected.——Considerable ore is being stored on the dump of C. P. Wingfield's group, near McCabe, which will soon be shipped to the El Paso smelter.——The drift on the 100-ft. level of the Mint Gold Mining & Milling Co.'s property in the Copper Basin district has opened 4 ft. of $30 ore. George W. Montgomery is manager.——The Golden Idol mill, in the Cherry Creek district, is being repaired by the Hillside Consolidated Mining Co., and will be in operation in a short time.——Activities are to be resumed by the Arizona Copper Gold Mines Co., operating in the same district, and plans for a 50-ton mill are being considered.——The Arizona Power Co. has connected the wires between its plant on Fossil creek and power house of the Prescott Electric Co. The local plant has been closed down but is kept in repair for reserve.

YUMA COUNTY.

The Ryan group, near Vicksburg, has been sold to El Paso capitalists for $10,000. The new owners are erecting new quarters for the men and are to sink on the ore which has been opened in several places showing a fair gold content.——J. W. Brown has shipped another lot of ore from his property near Quartzsite to the custom mill.——A large dredge is being erected at Middle Camp, four miles west of Quartzsite, to operate on the ground that was formerly worked by dry placer machines.——The Yum Yum mine has been sold to Eastern capitalists and is now in charge of O. A. Pease.——W. E. Scott is milling ores from the Old Goodwin and Poor Man properties, the last clean-up resulting in a $4500 gold bar.——The rails of the Arizona & Swansea road are laid to within eight miles of Bouse, and it is hoped to complete the track this month. Another locomotive has been ordered for the line and five converter shells and a 500-hp. Sterling boiler for the smelter of the Clara Consolidated Gold & Copper Company.

CALIFORNIA.

AMADOR COUNTY.

(Special Correspondence).—The north drift from the 1750-ft. level of the Bunker Hill has struck a strong flow of water and several promising bodies of ore have been intersected. As soon as the vein has been cut a drift will be extended from the 1950-ft. level to open it at that point. The December clean-up approximated $22,000.——The west drift on the 3300-ft. level of the Kennedy has cut a body of ore believed to be a portion of the foot-wall vein.——The Argonaut is completing a new station on the 3300-ft. level. Good ore has been opened at several points in the lower workings and monthly dividends of 5c. per share are being paid.——The South Eureka is paying regular monthly dividends. The December clean-up of the mill exceeded $42,000.——It is reported that a 9-ft. body of milling ore has

been opened in the adit on the Wiley property.——The Mitchell has installed a new hoist and is arranging to add an air-compressor.——An 'agreement for air' paper has been signed by the South Eureka and Central Eureka companies. It provides for the connection at several points of the shafts of the two companies for the improvement of ventilation, for the promotion of greater safety, and to facilitate operations in case of a fire or cave-in. The shafts are about 2400 ft. apart, and are already connected.——

Kennedy Mine, Amador County.

The Argonaut Mining Co. and the Kennedy Extension Co. are collecting evidence for the impending suit involving disputed ground.

Jackson, January 24.

CALAVERAS COUNTY.

Operations are to be resumed at the Pilot mine near Mountain Ranch. The mine has an excellent record and should prove a good producer.——At the Columbia property the shaft is being retimbered and a 6-ft. vein opened. ——Eastern capitalists have purchased the Ophir Consolidated Mines property from John Nuner and will commence work on the group in a short time. There is a good supply of water on the property, and an adit has been driven, opening the vein at a depth of 500 ft.——A small force of men has been started to work at the Boston mine near Mokelumne Hill.

KERN COUNTY.

(Special Correspondence).—One of the most important transfers of mining property that has taken place in this district for many years was completed the other day by the purchase of the famous Weatherbee group of tungsten claims. The purchaser is C. Grant Illingsworth, proprietor of the Miners' Supply Store, Randsburg. The Weatherbee group is situated near Atolia, the tungsten country, and includes the well known Goldstone claim. The tungsten occurs in the form of scheelite, of which a 3-ft. vein has been traced throughout the claims. This has been developed for a considerable distance, and a large body of valuable ore blocked out. The purchase price of the property, $12,000, has been paid and the further development of the claims will be carried on vigorously.——Great activity prevails in the Stringer district. This district gets its name from the fact that the gold-bearing quartz is not found in continuous veins of any great thickness, but in stringers or occasional patches of ore that are sometimes of great richness. One of the best of the claims in this district, developed and a constant producer, was bought last week by C. G. Illingsworth. The sellers were Ostick & Renne, and the purchase price was $2000. The mine, which is known as the Pearl Wedge, is in the neighborhood of the Sunshine mine.——Frank Feldman, who is working on a claim leased from W. Houser, in the Stringer district, has run into a large body of ore that promises well. Two tons milled last week ran over $100 per ton.——Spurlock and associates, who are working the Merced mine, have run into a promising body of ore. Up to this point their drift has been driven through quartz of unusual density, which has been found very hard to work. The present body is softer and the owners are much cheered by their prospects.

Randsburg, January 24.

NEVADA COUNTY.

The transfer of the Champion properties has finally taken place, the new company being represented by T. N. Kelly. The lessees have stopped work in the mine, although they have 500 or 600 tons of ore ready for crushing.——The drift on the 1050-ft. level of the Oustomah opened the shoot at a distance of 300 ft. from the shaft. The ore is high-grade, and two feet in width.——The drift at the Erie mine, near Graniteville, opened the shoot at a vertical depth of 150 ft. The vein is 10 ft. wide, and mills $40 per ton. There is a 30-stamp mill on the property which had been put in good order and will be started in a short time.—— At the Keller mine in the same district the adit opened a 10-ft. vein that assays $8 per ton at a depth that will give several hundred feet of backs.——Several stopes have been opened at the Prudential and 12 stamps are dropping in the mill.——Arthur H. Hoge has secured a bond on the Lily mine in the Grass Valley district. The bond runs for three years and calls for a payment of $35,000 if the option is taken up.

PLACER COUNTY.

The Spring Garden Mining Co. is retimbering the old shaft and installing new machinery at the property, and will drive a bedrock adit to open the channel. C. A. Palmer is superintendent.——Machinery is being hauled to the new Cash Rock dredge from Auburn. The new boat will be larger and better equipped than the old one.——The channel on the ground of the Pacific Mining Co. has been opened and good prospects obtained.——The mill at the Barton has been overhauled and a winze started at the adit-level. E. B. Quigly is superintendent.——Work will be resumed shortly at the Crandall mine under the direction of F. B. Norton.

SHASTA COUNTY.

A 2-stamp Nissen mill is to be installed at the Happy Jack mine, on Clear creek, west of Shasta. There are six claims in the group which is one of the first properties worked in the district, and is now under bond to Charles L. Page.——The Northern California Power Co. is extending its line from the substation at the Balaklala mine, to the Uncle Sam property. L. C. Monahan is superintendent. ——Operations are to be resumed at the Climax mine near Igo. A hoist has been ordered and a contract let to sink 100 ft. which will give the shaft a total depth of 300 ft. Experiments are being carried on to determine the advisability of erecting a cyanide plant. H. W. Robinson is operating the property.——The Victor Power & Mining Co. will install a 5-stamp Nissen mill at French Gulch next summer.——It is reported that the Gold Leaf Mining Co., owning properties in the Lower Springs district, expects to resume in the early spring.——The Delta continues idle, pending the adjustment of its difficulties with the Inca Mining Co.——The new machinery for the Milkmaid is arriving. The mill is operating at full capacity.——The working force at the Sibyl has been increased.

SIERRA COUNTY.

The Gold Star property, in the Alleghany district, has been purchased by the Alleghany Quartz Channel Mining Co., and will be developed on a larger scale this spring. The old adit has been recently cleaned out and retimbered for 3500 ft. opening gravel that averaged $5 per car.—— The new mill at the Bear Creek mine, in the American Hill district, is running smoothly and the management is looking for an excellent clean-up.——The adit at the Queen Radigunde mine on Kanaka creek is expected to open the contact within the next 400 ft. Frank B. Smith is manager. ——The Golden Fraction claim, on Chipps flat, has been bonded to Los Angeles parties.

TUOLUMNE COUNTY.

It is reported that operations are to be resumed at the old Dead Horse mine upon which the Erie Mining Co. holds a lease.——The Republic mine, near Parrot's ferry, is to be equipped with new machinery and a larger force of men put to work. A good shoot is known to exist in the property and with proper equipment the mine should be made to pay well.——The owners of the Gold Spring property near Jamestown have satisfied themselves as to the amount of

ore in the property and are preparing to erect a fully equipped 10-stamp mill. A new 30-hp. motor is being installed at the Draper mill. In the mine work is being carried forward on the second, third, and fifth levels.

COLORADO.

LAKE COUNTY.

The Virginius adit, in the Sugar Loaf district, opened a 1-ft. vein when in 1600 ft. that assays 12 oz. gold and 148 oz. silver per ton. There are seven veins in the property which will be opened by the adit, all of which have proved rich in the upper workings. The management expects to open these within the next 750 ft.——New dump cars have been added to the equipment at the Saguache adit, and electric power installed to operate the machinery. The face is now in over 500 ft. and has opened the first vein on the property.——A new air-compressor has been installed at the Little Vinnie property on Breece hill, and shipping will be resumed in a short time.——On the 365-ft. level of the Little Ella mine, in South Evans gulch, the drift has been run 70 ft. on a high-grade streak of ore.——The American Zinc Extraction Co. has installed three new concentrating tables in its plant.——The Yak tunnel has tapped the water in the Resurrection No. 2 shaft and is slowly draining the workings.

SUMMIT COUNTY.

The tunnel of the King Solomon Tunnel & Development Co. is nearly 4000 ft. and is expected to open a number of rich veins in its progress this year. This is the longest tunnel in the Ten Mile range and it is expected that the company will erect a large plant when the work is completed.——The severe weather has resulted in the shutdown of the New Pennsylvania property at Argentine, and a curtailed outpnt from the Sallie Barber mine.——The mill at the Wellington is running steadily producing a good grade of concentrate. The output will be considerably increased when the tram from the mine to the mill is completed.

TELLER COUNTY.

James F. Burns, former president of the Portland Gold Mining Co., has secured the control of the Jennie Sample Consolidated Mining Co. Two sets of lessees are now working through the main shaft and shipping high-grade ore. ——A rich shoot has been opened between the tenth and eleventh levels of the Findley property by Frank Clay and associates who have a lease on that portion of the mine. It is estimated that the fine ore will run about 2 oz. gold per ton, and the coarse 1.——At a stockholders' meeting A. E. Carlton, president of the Findley Consolidated Mining Co., reported that the company had paid off its indebtedness of $20,000 during the past year, and now had a balance in the treasury of over $16,000.——Gibbs, Sharpe & Klatz are shipping $40 ore from the lease they recently obtained on the Bonanza King property. An air-line has been laid from the Anchoria Leland plant enabling the lessees to operate machine-drills.——The Consolidated Cripple Creek Mines Corporation has been incorporated to take over and operate the properties held by the Cameron estate.——The Success Leasing Co., which has a bond on the Gold King mine on Gold hill, is to build a 50-ton mill below the dump at the International shaft.——A new set of rolls has been installed in the mill of the Trilby Mines Co. increasing the capacity of the plant to 70 tons per day.

KANSAS.

CHEROKEE COUNTY.

(Special Correspondence).—Steady progress is being made at the Mission mine, at Baxter Springs, where the ground has just been drained and tracks laid preparatory to furnishing the large new 500-ton mill with ore. Many new saving devices have been added to the equipment of the new mill which other companies are watching with interest as several other large mills are to be built this year. ——The Tennessee Metal Producing Co. has been extending its possessions by the acquirement of new properties recently. The 30 acres of ground, including two shafts of the old Quivera company, has been taken over with the mill upon the tract, and work will be started at once. The company also took over the Mascotte mine and 10-acre lease, and a tramway will be built from the latter shaft to the old Quivera mill where the ore will be treated.——The Omaha Petersburg Mining Co. has four drills at work on the lease to determine the extent of the ore and its general dip in order to determine the best point upon which to build its large new mill. All the holes so far show both lead and zinc.

Galena, January 21.

MISSOURI.

JASPER COUNTY.

(Special Correspondence).—The Mandarin Mining Co., west of Joplin, has resumed operations after a six months' shut-down. At the time of opening the mine a splendid ore-face was opened up which later pinched out and the company was forced to suspend operations. Since that time the operators have been busy trying to re-open the run and have recently succeeded in finding the ore in the roof of the old drifts. The former sinking was too deep for the ore. The mill on the lease is exceptionally well equipped for the treatment of the ore.——The new 400-ton mill of the Mercantile Mining Co., operating north of Webb City, is just completed and is only awaiting more favorable weather to start work. This is the third mill to be built on the lease by the company, the other two each having a capacity of 300 tons. The company has been working in sheet ground from 165 to 175 ft. for some time. Below this level is a thin layer of barren rock below which another sheet run extends to 200 ft.——The Hercules Mining Co., operating on the Luke & Ash ground, in the west Joplin dissem-

Zinc Mining and Smelting Centres.

inated field, is just completed and will start work soon. The mill has a capacity of 500 tons. The shaft is down 202 ft. and drifts have been started on that level. The run extends from 182 to 200 ft. The sheet ore in this part of the field is somewhat different from the Webb City sheet ore being in a softer formation and more easily mined.—— The Maple Leaf Mining Co. is building a 200-ton plant on its developed lease in the Duenweg camp. The lease adjoins the Lincoln and Wolfsheart and the formation is similar.——S. A. Stucky, of Carthage, who owns a lease on the Knight land at Peacock, is planning the erection of two large mills on the lease. Several drill-holes block out a good ore deposit.——A steam-shovel is being operated in the Mohler-Smith open pit at Carl Junction and it is found more economical of operation than hand labor.

Joplin, January 21.

MONTANA.

SILVER BOW COUNTY.

(Special Correspondence).—The report that the Anaconda Copper Mining Co. will run a cross-cut for the North Butte company from the bottom of the Diamond mine to the Edith May still lacks official confirmation, though it is understood that the matter has been under consideration for some time. According to recent reports of average car samples the North Butte ore, which used to average 6 to 8% copper, now runs below 4.——The Butte & London Development Co. held an annual meeting of stockholders a few days ago and a report to the stockholders concerning the company's financial condition is promised later. The company still has a little cash on hand and considerable

stock in the treasury. The only expenditures since 1907 have been for a watchman, taxes, and small office expenses. There is no immediate prospect for a resumption of work at the property, and so far as known no effort is being made to re-finance the company.——According to the reports of engineers there are 750,000 tons of ore blocked out in the Ophir mine, the property of the Butte Central Copper Co., and this fact adds interest to the report of Lewis & Walker, assayers and chemists in Butte, who made a concentration test for the company on 300 tons of ore. The ore was crushed to 30 mesh, and 9¾ tons were concentrated into one. The concentrate assayed 180 oz. silver and $8.40 gold per ton, with 8.03% copper, 18% sulphur, 26% zinc, 18.8% iron, 7.6% silica, and 15.37% manganese. There was lost in the tailing 26 oz. silver and 40c. gold. The chemists say the ore is splendid for concentrating, not being inclined to slime much, and that the tailing can be pan-amalgamated with a possible saving of 85 to 90% of the value. The possibilities of the mine lie in the big tonnage of ore in sight, the cost of treating concentrate, which is $2 per ton as against $8 that was charged by the smelters for treating the ore, and the claim of the management that the ore can be mined and milled at a total cost of $2.50 per ton.——The Basin concentrator, owned by La France Copper Co., a Heinze concern, has started operations on ore shipped from the mines of the Butte & Superior company. Only half of the concentrator is being used and the remaining portion will be reserved for La France and Davis-Daly ores. The Butte & Superior is shipping about 175 tons of ore per day, and is concentrating only for zinc and silver. A gravity tramway has been built from the mine to the bins and a railroad spur line is being built to connect with the Great Northern railway, over which the ore is transported to Basin.——The stockholders of the British-Butte Mining Co. held their annual meeting in Butte last week and re-elected the old board of directors, with the exception of Mr. De Hora, who resigned as president, manager, and director of the company. Norman L. Jenks, of London, representing the British interests in the company, was elected president and manager, and W. R. Hocking, of Butte, succeeds Mr. De Hora as director. Operations on the big gold dredge near Butte were suspended last October, and the dredge has been idle ever since. The work is now confined to prospecting and a bore-hole is being sunk from the bottom of the 670-ft. shaft, in an effort to find bedrock. The bore has reached a depth of more than 500 ft., giving a total depth from the collar of the shaft of 1175 ft. A considerable quantity of water has been coming into the bore-hole and that gives the impression that the bedrock is near. The gold value continues quite uniform throughout the bore-hole.

Butte, January 22.

NEVADA.

ESMERALDA COUNTY.

(Special Correspondence).—Interest in the holdings of the Jumbo Extension Co. has been aroused by the discovery of pay-ore at a depth of 760 ft. in the shaft of the Annex lease, operating on the Poleverde claim, adjoining the Clermont on the east and the Velvet and St. Ives claims of the Goldfield Merger Mines Co. on the west. This double compartment shaft has been sunk with an objective depth of at least 1000 ft. at about which point it was expected to penetrate the hanging wall of the Mohawk vein and at 760 ft. the shaft entered a large vein of quartz giving low-grade assays. Farther down an ore-shoot with two feet of $50 ore was opened and the main vein is shown to be 20 ft. wide. At the 800-ft. level a large station will be cut and the vein explored. As the result of litigation instituted by the Consolidated company some time ago against the Jumbo Extension, involving apex rights to the Poleverde and other claims, an agreement was signed by the terms of which all profits from the operation of this claim are to be equally divided between the two companies. Under the same agreement the Consolidated was ceded a one-half interest in the Vinegerone Fraction and clear title to the Wedge Fraction, side-lining the Mohawk.——One of the latest developments of interest is the discovery of rich ore on the Diamondfield Black Butte where an adit has been driven 75 ft. and from a winze at the end lessees have taken 20 tons of shipping ore. The vein is over 30 in. wide. On January 15 the property was sold under execution to satisfy the claims of creditors and was bought in by the Registration Trust Co., acting as trustee for the chief stockholders. The trustee is now carrying out plans for the organization of a new company, to be known as the Diamondfield Black Butte Re-organized Mining Co., the stock of which will be assessable, and it is the intention of the men at the head of the project to build a mill of at least 50 tons per day capacity.——Satisfactory results have attended the sampling of the Gold Bar workings of the C. O. D. Consolidated Co. by the men who have secured the ground and plant under a five-year lease, and who will build a 50-ton mill early in the spring.——During the month of December the total production of the Goldfield Consolidated company was 20,234 tons containing $741,668, or an average of $36.65 per ton, of which the whole was milled with an average extraction of 93.83%. The net profit to the company was $495,353.14, or $24.48 per ton. The development work consisted of 4390 lineal feet. J. R. Finlay does not report on developments and mine conditions owing to his unfamiliarity therewith and the fact that J. H. Mackenzie and H. P. Henderson are both absent. He states, however, that the development work accomplished was undoubtedly successful to the usual extent and the amount of work done was unusually large. The mill has been demonstrated to have a capacity of fully 850 tons per day. This increase of capacity has been accomplished without any loss in the metallurgical efficiency of the plant.

Goldfield, January 22.

LYON COUNTY.

(Special Correspondence).—Walter C. Orem, the general manager of the Nevada-Douglas mines and railroad, has gone to Mason City to be on hand at the opening day of the advent of the railroad into Mason City. From that point the line is to be extended some 20 miles to the mines of the Nevada-Douglas. This work will be completed early in the summer months, and then the company will commence shipping high-grade copper ore from its Ludwig mine to the Salt Lake smelters. Several years ago Frank J. Hagenbarth took an option on the purchase of the Ludwig mine from Joseph E. Cain and Max Junghandel for which he agreed to pay $200,000. Cain and Junghandel had entered into an agreement to purchase the Ludwig mine from the owners for $1,000,000 and Hagenbarth agreed to pay $200,000 for the privilege of taking over the property from Cain and Junghandel. A payment of $30,000 was made on the option and Hagenbarth had the mine examined and refused to pay more on the option. In the meantime the Nevada-Douglas Mining Co., in which Hagenbarth is heavily interested, purchased the property from the Ludwig crowd, and Cain and Junghandel instituted suit to recover the balance of the $200,000 from Hagenbarth. The Supreme Court has handed down an opinion in which it holds that Hagenbarth was not forced to carry out his option payments, and releases him from further obligations to Cain and Junghandel.——The Mason Valley Mining Co. has just completed its metallurgical work, and determined upon the best methods for treating its ores. A smelter will be erected at once, the equipment for which is now being ordered, and the foundation is about completed.——Several of the Yerington properties are in shape to begin consigning ores to the market as soon as the new railroad is ready to receive them.

Yerington, January 21.

NYE COUNTY.

The 30-stamp mill of the Tonopah Extension has been started, the entire plant having been completed in seven months. The ore is reduced to 1½ in. diam. before going to the bins, is crushed to 20-mesh by the stamps, passed to Deister tables and the sand put through two tube-mills, the tailing going to Dorr classifiers. The pulp is then classified, treated on slime tables, and cyanided in a Blaisdell filter.——The ore recently opened on the 1100-ft. level of the Belmont mine has widened to 16 ft. with an average value of $40 per ton.

OKLAHOMA.

OTTAWA COUNTY.

In the Miami camp, just south of the Baxter-Quapaw camp, a deeper ore-level is being opened up by the Miami-Yankee company. The company recently changed management, L. C. Church being succeeded by George Wolfe. The old shaft is being sunk to the deeper levels and turn-ins have already been made.——Chapman & Lennan, of Webb City, have recently sold the King Jack mine, one of the best and steadiest producers in the Miami camp. It was one of the earliest mines and its turn-ins have at times been the leaders in the field. The mill was burned down last summer, but was immediately rebuilt. Pennsylvania parties are the purchasers.

Miami, January 22.

UTAH.

JUAB COUNTY.

The Sioux Consolidated Mining Co. directors have decided to make the dividends payable quarterly in the future. It is shown that the mine is now producing a lower-grade ore from its workings at Tintic, and the owners have decided to devote some of the surplus money to carrying on deeper development work. This may necessitate several months' operation, and the dividends will be made quarterly in consequence.

SALT LAKE COUNTY.

(Special Correspondence).—The Utah Con. tram which is to be completed this summer will have a capacity of 1500 tons of ore daily, which it is estimated will reduce the cost of transportation from the mine to the smelter from 40 to 10c. per ton. The mine is under contract to deliver 1200 tons of ore per day to the smelter, and should other mines at Bingham desire to take advantage of cheap haulage, the capacity of the tramway will be increased to accommodate custom shippers.——Since the second unit of the Ohio Copper mill was started only about 100 tons of ore per day is being reduced in this portion of the mill. The capacity of the unit is 500 tons, while experiments have shown that under favorable conditions as much as 750 tons can be handled with ease. The first unit is handling about 500 tons per day and the second portion will be worked up to capacity as soon as all the adjustments are completed and some raises in the mine are connected to drain the upper workings. No new development work is to be done on the Elvina vein for the present, as it is the purpose to devote all efforts to making connections for proper drainage. When this work has been finished, a raise from the 500-ft. level of the Elvina vein will be made to the upper portion of this deposit and connections between the 500 and 700-ft. levels made in order that this ore can be dropped down the incline to the Mascotte adit. An offset will be made in the chute near the adit so that the Elvina ores can be dropped into separate bins on the adit level. This ore contains a high percentage of copper and an excess of iron. ——Daniel C. Jackling, general manager of Utah Copper, is in Arizona inspecting the Ray and Gila copper properties. He will return within two weeks, and complete the transfer of the Boston Consolidated to the Utah Copper. The present staff of Utah Copper will have charge of both properties, and few of the Boston corps will be retained. Louis S. Cates, the mine manager, will remain in charge of the Newhouse interests in Utah during the coming year, or until the return of Lafayette Hanchette from his trip around the world. Upon the return of Samuel Newhouse from Europe he will take some of his engineers to guide the affairs of his other properties in this State and Arizona. ——Utah Metals Mining company, which has taken over the Bingham Metals and Central-Standard properties at Bingham, has just ordered complete new equipment. The main working tunnel, being driven from the Middle canyon side of the range, is now in a distance of 3000 ft. It is to be continued 8000 ft. farther to get under the ore-bodies of the Central-Standard ground. The tunnel is to be double-tracked, the water developed utilized for power, and a large generating plant installed. It will cut the ore-zone in Central-Standard ground at a depth of over 2000 ft., and increase the present water-flow from 500 to 3000 gallons per minute. The tunnel will be driven through the mountain to the Car Fork side of the range, and will drain a large area.

Salt Lake, January 22.

SUMMIT COUNTY.

George W. Lambourne, general manager of the Daly-Judge Mining Co., at Park City has gone to New York. The object of his trip at this time is to confer with Eastern directors with reference to starting work on the proposed Snake Creek tunnel. Most of the machinery has been delivered, the compressor, power-house, and other buildings will soon be placed in position. The tunnel is controlled by a separate corporation. The proposed course will intersect the Daly Judge at a depth of more than 2000 ft., and drain a large area of adjacent country. It will be 4000 to 5000 ft. long, thus making it one of the most important pieces of development work undertaken in Park City since the Ontario tunnel was driven over 15 years ago.

CANADA.

BRITISH COLUMBIA.

(Special Correspondence).—Resolutions affecting the mining industry, that will be placed before the convention of the Associated Boards of Trade, which will be held at Nelson, January 25, will include one from the Rossland Board of Trade that the Government of the Dominion of Canada be requested to coin silver dollars in the Ottawa mint. This will naturally increase the amonnt of fine silver that the Government will buy from the Trail refinery and will prove of local benefit, provided the step is taken. Another resolution will be toward the abolition of the existing personal tax on merchandise, machinery, and such stock or plant as is carried for the general conduct of business. ——The following change in the Mineral Act becomes law on April 1: "The owner, or agent of the owner of a mineral claim for which the mining recorder's certificate under form 1 of the schedule of this act, has been granted, shall, within three months from the date of such certificate, make application to the gold commissioner for a certificate of improvement, and in default of such application being made in such time, such mining recorder's certificate under form 1 shall lapse and become absolutely void." This will compel those who have secured certificates to make application for their Crown grants without unnecessary delay.——Future improvements planned by the Le Roi No. 2, Ltd., indicate a period of steady progress ahead. The Josie shaft has just been sunk from the 900 to the 1300-ft. level, where work is now in progress.——The Centre Star group of the Consolidated company shipped over 4000 tons for the past week. The Consolidated company has paid $6000 for the Black Jack and Caberfae Fr. claims, adjoining the recently acquired No. 7 group in Central camp.——H. A. Harris, of Rossland, has bonded the Silver Cup for $40,000 and the Sunrise for $60,000, in which he owns a half interest. They are silver-lead claims situated near Hazelton, at Nine Mile mountain. ——The movement of the Granby Consolidated Mining, Smelting & Power Co. to dispose of 13,500 shares of its treasury stock, with which to pay off outstanding indebtedness, especially referring to the amount owing for the stock in Crow's Nest Pass Coal Co. acquired last year, is looked upon favorably here and many of the shareholders are availing themselves of the opportunity and taking their share of the stock at the preferred figure of $85.——Work at the B. C. Copper Co.'s mines will not be suspended on account of the trouble with the Miners' Union, the company having applied to the Government for a conciliation board under the Arbitration Act. The 'closed shop' is the issue.——A local syndicate, the Phoenix-Riverside Co., has purchased the Riverside property on the West Fork.—— Surveyors are running the preliminary survey for the extension of the Great Northern railway from Oroville to Penticton.——The managing director of the Lucky Jim zinc mines confirms the report that a body of shipping ore has been struck in the lower adit assaying from 52 to 53% zinc.——It is stated that the Crow's Nest Pass Coal Co. is to resume dividends of 6%. The coal production at the mines has increased in the last six months from 3000 to 4000 tons per day.

Rossland, January 21.

Personal.

Professional men are invited to send news of their engagements and travels. Such news is interesting to friends.

L. A. GREENE is at Chicago.

R. H. CAMPBELL is at Seattle.

J. MORGAN CLEMENTS was at Butte this week.

RALPH ARNOLD was in San Francisco this week.

A. B. SHUTTS has gone to Minillas, Zacatecas, Mexico.

DANIEL C. JACKLING is in Arizona for a couple of weeks.

W. P. RAWLE, of New York, has gone to Phoenix, Arizona.

MARK R. LAMB is visiting the Lake copper mines in Michigan.

EDWIN E. CHASE, of Denver, is examining mining property in Arizona.

W. F. COPELAND has returned to San Francisco from Butte, Montana.

NORMAN C. STINES has returned to San Francisco from Hoag, California.

R. B. NICKERSON has gone to Rat Portage, Ontario, to examine the Mikado mine.

A. G. KIRBY is with the Nova Scotia Silver-Cobalt Mining Co., at Cobalt, Ontario.

ARTHUR YATES is general manager of the Mijnbouw Maatschappij Ketahoen, Sumatra.

C. W. PRITCHETT and G. W. GIBSON, of Denver, were recently in Mohave county, Arizona.

S. H. BALL has returned to New York from New Mexico, and will go to Belgium in February.

E. H. BARTON is manager for the Frisco Mines & Power Co., operating near Kingman, Arizona.

F. L. RANSOME will attend the Toronto meeting of the Canadian Institute of Mining Engineers.

SAMUEL J. LEWIS is at Monterey, Mexico. He will be at Hostotipaquillo, Jalisco, about February 1.

CLIFFORD D. FIES has left Colorado Springs and will be with the New Keystone Copper Co., at Miami, Arizona.

ALEXANDER H. SMITH, recently of Oaxaca, Mexico, is in the Porcupine district of Ontario for A. E. Osler & Co. of Toronto.

GODFREY D. DOVETON, of Spurr & Cox, Inc., is at the DeLamar mine, DeLamar, Idaho, making an examination of the cyanide mill.

EDGAR A. COLLINS is examining the Black Oak mine in Tuolumne county, California. He expects hereafter to make headquarters in San Francisco.

WILLIAM E. CASTLE, until recently with the Chafey Mines Co., at Chafey, Nevada, is operating a property at Spring Valley in that State.

W. H. WEED, who has been examining the Ely Central, passed through San Francisco this week on his way to New York by way of Los Angeles.

A. E. DRUCKER has reached San Francisco on his tour around the world. He has been appointed consulting metallurgist for the Oriental Consolidated.

R. B. LAMB, of the C. L. Constant Co., has returned to New York from a professional trip to New Ontario, Canada, and has left Central America. He expects to be gone some time.

ALFRED WELFHAVEN becomes general manager for the Oriental Consolidated Mining Co., at Unsan, Korea, in place of H. F. MESERVE, who becomes managing director with headquarters in New York.

LEON M. HALL and D. C. DEMAREST have joined to form the firm of Hall, Demarest & Co., Inc., making a specialty of mines, mills, and power plants. Offices have been taken in the Kohl building, San Francisco.

THE MINING & METALLURGICAL SOCIETY OF AMERICA held an adjourned session of the annual meeting at New York, January 20.

Mint Estimates of Gold and Silver Production in the United States, 1909.

The Director of the Mint has completed his preliminary estimate of the production of gold and silver by the mines of the United States for the calendar year 1909. He estimates the gold product to have amounted to $99,232,200, as against $94,560,000 for 1908; an apparent increase of $4,672,200. The output of silver is estimated to have been 53,849,000 fine ounces, an increase over the previous year of 1,408,200 fine ounces. At the average price of silver ($0.52016 per fine ounce) for the year the commercial value of the silver product for 1909 would amount to $28,010,100. Nevada shows an apparent increase in her gold product of $3,219,000, California $1,941,600, and Alaska $1,088,800. Colorado shows a decrease of $916,300, and South Dakota $892,300. The decrease in the latter State is attributable to the closing down of the works of the Homestake mine on account of labor troubles. Montana shows an increase in her silver product of 1,643,800 fine ounces, Utah 1,082,100 fine ounces, and Arizona 732,200 fine ounces. The greatest decreases in the silver product were: Colorado, 1,056,600 fine ounces; Nevada, 555,500 fine ounces; and Idaho, 503,800 fine ounces. The product of gold and silver by the different States and Territories is shown in the following table:

State or Territory.	Gold		Silver	
	Fine oz.	Value.	Fine oz.	Value.
Alabama	1,355	$ 28,000	200	$ 100
Alaska	1,013,340	20,947,600	158,100	82,200
Arizona	129,273	2,672,300	3,632,200	1,889,300
California	1,029,000	21,271,300	1,705,200	887,000
Colorado	1,062,056	21,954,700	9,093,600	4,730,100
Georgia	2,141	44,300	200	100
Idaho	67,207	1,389,300	7,054,500	3,669,500
Illinois	14	300	3,600	1,900
Michigan	.....	.....	323,900	168,500
Missouri	9	200	15,200	7,900
Montana	174,123	3,599,400	12,000,000	6,241,900
Nevada	721,195	14,908,400	8,953,000	4,657,000
New Mexico	13,464	278,300	329,200	171,200
North Carolina	1,557	32,200	500	300
Oregon	34,488	712,900	71,100	37,000
Philippine Is.	9,000	186,100	2,100	1,100
Porto Rico	30	600	.....	.....
South Carolina	169	3,500	200	100
South Dakota	331,363	6,849,900	205,600	107,000
Tennessee	179	3,700	58,500	30,400
Texas	18	400	358,300	186,400
Utah	185,993	3,844,800	9,533,400	4,958,900
Virginia	175	3,600	6,000	3,100
Washington	18,282	377,900	73,500	38,200
Wyoming	184	3,800	1,100	600
Other States	5,744	118,700	269,800	140,300
Total	4,800,359	$99,232,200	53,849,000	$28,010,100

The above estimate is based upon deposits at the mints and assay offices of the United States and reports from private refineries and smelters in the United States.

Commercial Paragraphs.

The Wood Drill Works, Paterson, New Jersey, are now represented in Colorado, South Dakota, and New Mexico by Thomas J. Barbie, 1416-1418 Wazee St., Denver, Colorado. A large stock of drills, repairs, and mountings are now on hand.

Smith, Emery & Co., Inc., San Francisco, announce the following appointments as chief inspectors in the iron and steel department: San Francisco office, W. F. Richards; Los Angeles office, E. O. Slater; Pueblo, Colorado, office, M. L. Kulp; Birmingham, Alabama, office, R. T. Miller.

The Trent Engineering Co., composed of the well known firms of L. C. Trent & Co., of Salt Lake, and the Trent Engineering Co., of Reno, Nevada, having combined, have opened a branch office in Los Angeles, California. The new company will make a specialty of L. C. Trent slime agitators and Chilean mills, and is agent for the Oliver continuous filter. This type of Chilean mill has been adopted by the Goldfield Consolidated Mining Co. at Goldfield, Nevada; and Trent slime agitators have been installed in the mills of the Montgomery-Shoshone, at Rhyolite; the Tonopah Extension, at Tonopah; Desert Power & Mill Co., at Milliers, Nevada.

The Ernst Wiener Co., New York, advises that it has opened branch offices in the following cities: Petersburg, Virginia; Ocala, Florida; Toronto, Ontario; and Mexico City. Changes of address of its other offices are as follows: Los Angeles, 223 H. W. Hellman Bdg.; Philadelphia, 1103 Land Title Bdg; San Francisco, 112 Market street.

COMPANY REPORTS.

SHANNON COPPER COMPANY.

The annual report of the Shannon Copper Co. for the year ended August 31, 1909, is issued. The income compares as follows:

	1909.	1908.	1907.	1906.
Copper receipts	$2,328,467	$2,249,294	$2,994,539	$1,919,034
Silver receipts	34,899	63,508	25,147	17,824
Gold receipts	44,495	33,626	64,380	12,708
Copper inventory	321,337	316,603	313,608	275,190
Totals	$2,729,199	$2,663,033	$3,397,676	$2,224,756
*Total operating expense	2,644,861	2,574,191	2,701,759	1,891,431
Net profits	$84,337	$88,841	$695,916	$333,324

*Including construction, freight, refining, interest, and inventory.

During the year there were sales of 17,553,213 lb. of fine copper, 1744.955 oz. gold, and 87,115.53 oz. silver.

Good progress has been made during the year both as to production and development of new orebodies. The production of 307,271 tons of ore is an increase of 25,822 tons over the preceding year, and is by far the largest output in the history of the company. The mines were, at the close of the fiscal year, in the best possible physical condition, with more ore of better grade blocked than at the end of the last fiscal year, notwithstanding the fact that the production for the year was the largest in the company's history. The extraction for the year was 2.57 lb. of copper per ton less than for the preceding year, which on the tonnage treated means a shortage of about 800,000 lb. of copper, worth in the neighborhood of $100,000.

The development of ore below the ore-tunnel, at a point heretofore supposed to be non-mineral-bearing ground, opened about 80 ft. of ore which averaged 8% copper, and a streak of ore 8 ft. wide, assaying as high as 35% copper. In a winze below the ore-tunnel was 20 ft. of ore assaying 15% copper. The new development proves that the ore in the Shannon mines continues in depth and gives renewed assurance as to future production. The new high-line railroad, now being operated from the company's mines to the smelters, a distance of about ten miles, should be in operation by the first of February 1910, and will start with a freight tonnage of about 400,000 tons per annum from the Shannon company alone.

A reduction in the cost of power of $45,000 has been effected for the year, and also a small reduction in the cost of mining, concentration, and converting. In the aggregate these various reductions in costs have offset the loss of approximately $100,000 which was incurred through the lower extraction of ore for the year. There has been a decrease in the cost of smelting per ton during the past year of 32.7c., and the cost of concentrating was reduced approximately 14c. per ton.

L. Vogelstein & Co. give the following figures of German consumption of foreign copper for the months January to November 1909:

	Tons.
Imports of copper	143,988
Exports of copper	7,485
Consumption of copper	136,503

as compared with consumption during the same period in 1908 of 139,080 tons. Of the above quantity, 131,716 tons were imported from the United States.

EDITORIAL.

THE BUREAU OF MINES bill has passed the House at Washington and is now before the Senate. Considerable opposition there is anticipated. Your Senators will be glad to know whether you do or do not favor the movement.

TASMANIA proposes to stop high-grading. A bill has been passed requiring gold-buyers to take out a license and to keep a complete record of the amount of gold bought, with the name of each seller. Any false return is made perjury.

INFORMATION has been received of action taken by the Board of Directors of the Anaconda Copper Company to effect a coalition of mines in Butte, Montana. The proposal is to increase the capital stock of the Anaconda, by a considerable amount for that purpose.

THE American Institute of Mining Engineers will hold a meeting at Pittsburg, beginning March 1. Headquarters will be at Hotel Schenley and an interesting session seems to be in prospect. An excursion to Japan is proposed for next fall, leaving San Francisco October 5, and returning November 25.

RADIUM is flanked by many close allies. Two new radio-active elements have been added to the list, one of which, called nipponium, was recently discovered by a Japanese chemist, Ogawa. It has been isolated from thoranite, remite, and molybdenite, and has an atomic weight of 100. Sir William Ramsay assigns it to a position in the periodic scheme of the elements between molybdenum and ruthenium. The other newly discovered radio-active element is ionium, which is evidently an intermediate stage in the transformation of uranium into radium. Its radio-activity is 1000 times as great as uranium, with a ratio of 1 to 0.76 as compared with radium. It is obtained from carnotite and other uranium minerals.

MINING EXPERIMENT STATIONS corresponding in character to those which have done so much for agriculture have been proposed a number of times. North Dakota has taken the lead by making official provision for such a station at its University. The especial work to be undertaken will be the investigation of the utilization of lignites and clays. It is rather striking that a State which is principally famous for its agricultural wealth should be the one to take initiative in this. In Illinois a considerable amount of work relating to mines has been carried on at the Engineering Experiment Station and in Colorado and Utah ore-testing plants are

maintained in connection with Schools of Mines. In a number of other States provision is made in one way or another for some work, but there is a field for a few Mining Experiment Stations. The effort to enlist Federal aid in establishing them has not heretofore been successful, and in any event the main burden of their support must inevitably rest on the States.

WATER-POWER policy, discussed more extensively on another page of this issue, is the subject of a bulletin just issued by the United States Geological Survey. The question is fraught with deep concern to the mineral industry. In many Western districts cheap hydro-electric power is the only means whereby some of the great mines are able to operate at a profit.

CHINESE railway development is reviewed in great detail in the November issue of *The Far Eastern Review*, just received. Railway loan agreements, in their relation to the open door, are discussed with that fairness which is characteristic of our vigorous contemporary at Manila. Mr. G. B. Rea's plea for fair play to China is refreshing in these days of emphasis on the white man's burden. It is better for everybody that each should 'tote his own load', and one of the best features of the present situation is the ability shown by the Chinese to build and operate their own lines. They need the help of foreign capital, but, except when foreign engineers have been in charge, they have shown a catholic spirit in the purchase of railway equipment.

COAL MINERS are much more generally members of labor unions than are metal miners. This is partly due to the difference in conditions, since coal mining does not afford the same opportunity for the advance of the individual miners that is offered by the leasing system and the ground open for prospecting throughout the West. Also, the coal miners have had better leadership. Mr. John Mitchell won a deserved and general popular support, and that in turn won many battles for his organization. His successor, Mr. T. L. Lewis, has still to achieve the same measure of public confidence, but in his annual report submitted recently at Indianapolis, he takes winning ground in saying: "Let us appeal to the intelligence of the operator and miner in the non-union mining districts. Perfect frankness in stating our position and sincerity in carrying into effect our declarations will do much to establish the confidence necessary to success. The application of common sense should be the basis of the new method of promoting industrial peace in the mining regions." His address as a whole is a broad gauged appeal to the members of the United Mine Workers, and it is to be hoped that the spirit which animates it will dominate the organization. The labor problem has many sides, and the West has seen more of the evil than the good side of labor unions. In view of the close relation now obtaining between the Western Federation of Miners and the United Mine Workers, operators of Western metal mines have a very definite interest in Mr. Lewis and his ideas.

Oriental Trade and American Shipping.

Americans are pleased to consider themselves aggressive and keen in trade, yet our correspondent from Tientsin, China, Mr. Thomas T. Read, sends severe criticism of the methods pursued in seeking foreign business. The arraignment is justifiable. The same facts have been set forth by American travelers for many years; the Consular Reports have published the story from a hundred ports; Mr. Charles M. Pepper reiterated it after a personal investigation of conditions and trade opportunities in South America made a few years ago for the Department of State. This cry has been sounded for twenty years, and Mr. Blaine used to urge American manufacturers to conform to the requirements of foreign trade in order to secure their proper share of the business. The answer has always been that domestic consumption created a sufficient demand, and that the cost of special attention to detail, as required for successful invasion of over-sea markets, was out of proportion to the benefits that would accrue. This argument was not without warrant twenty years ago, but conditions have been changing. Increase in manufacturing has been so great that the outward pressure for markets has grown more pronounced. Competitors abroad have foreseen this more clearly than our own people, and we think that there is truth in the contention of Mr. Edward P. North, whom Mr. Read criticises; obstacles are apparently thrown in the way of efforts to expand our shipping and foreign trade-relations by forces without as well as within the country. Contact with the foreigner is imperative as a means to understanding his needs, and such contact is in direct proportion to the merchant tonnage afloat under the flag. We recommend a re-reading of Mr. Pepper's contribution to this subject.

Water-Powers and Eminent Domain.

Industrial development in the West requires the utilization of its water-power. That power, furthermore, must be available to all upon equal terms, and upon reasonable terms. Monopoly of so vital a resource should be neither in the hands of the Government nor of private persons or corporations. The Government should not be able arbitrarily to limit the development of water-powers, nor should private owners be free from Governmental regulation. In Switzerland, less than three years ago, the control of the water-power of the country was transferred to the central Government by amendment to the Federal Constitution. The power will be used in part for operating the railroads which belong to the State, the estimates indicating a reduction of one-third from present costs. The current will also be sold to the cantons, cities, and smaller communities, which will distribute the power to local consumers. Swiss methods are not, however, necessarily applicable to American problems, owing to radical differences in legislative and administrative details.

At the present moment the status of the undeveloped Western water-powers is involved in doubt. The areas where water is available under head suffi-

cient to be utilized for the generation of electricity are embraced almost entirely within the public domain. The water itself, belonging as it does to the States, has been appropriated in accordance with local laws, but the United States Government by virtue of its ownership of the adjacent lands exercises control through its power to grant or withhold easement for right of way for ditches, dams, and other works necessary in the utilization of the water. Recently Mr. Thomas H. Carter, Senator from Montana, introduced a bill to endow the States with the right to grant title to public lands needed for water-power development. It is interesting to note that this bill is fathered in Montana, where the State Constitution directly disclaims all rights in unappropriated public lands. It would seem that the bill in question was with a view to special difficulties experienced by private companies in Montana; in other States it is probable that such legislation would be unnecessary for a legitimate utilization of water-powers, perhaps even in the Forest Reserves—and a legitimate use is one that the courts would sustain as a public utility. In such a case the United States as proprietor is not exempt from the application of the principle of eminent domain. The public lands are held in trust by the Federal Government, not for its own benefit, but for the advantage of the people of the States themselves. As pointed out by Mr. S. C. Smith of California in a recent speech on this subject in the House of Representatives, "the United States of America is not a business institution, looking for profits and dividends; it is a government pure and simple." If the Secretary of the Interior could determine the conditions for utilizing the vital resources of such vast areas as are included within the public domain in the West, he would have it in his power to throttle the development of the States. But no dangerous authority in this matter now vests in the Secretary of the Interior. The States already possess ample jurisdiction. We believe that no need exists at the present time for a law directly conceding to the separate States a right which they already possess. It would make easier the appropriation of water-powers, which now is made sufficiently difficult to prevent abuse. A case in court is open and notorious, while a petition passing through a State bureau generally becomes known only to a limited number. Manifestly the rights of the public would be better conserved by requiring that condemnation proceedings in open court be instituted, whatever additional provisions for equitable public service might be imposed by State laws upon the rights so obtained.

That the States' right of eminent domain does apply as against the public lands of the United States is clearly sustained by decisions of the Federal Courts. In the case of the United States *v.* Railroad Bridge Company (6 McLean 517) the right to condemn Rock Island, formerly a military post, in the Mississippi river, was affirmed, and it was further held that every State has the power under eminent domain to authorize the construction of railroads and public roads, through the lands of the United States. The same opinion declared that "the proprietary right to lands in a State, held by the Federal Government, is in many respects similar to that of an individual. * * * The proprietorship of land in a State by the general Government cannot, it would seem, enlarge its sovereignty or restrict the sovereignty of the State." The decision cited lays down principles directly applicable to the water-power problem in its existing status: "Where lands are reserved or held by the general Government for specified and national purposes, it may be admitted that a State cannot construct an easement which shall in any degree affect such purposes seriously. * * * The right of eminent domain appertains to State sovereignty and is exercised free from the restraints of the Federal Constitution." Again, in Jones *v.* Florida Railway Company (41 Fed. 70) the court said, "Every State has, by virtue of its sovereignty and right of eminent domain, power to create * * * easements upon all lands within its limits unless specially reserved for the purposes of the National Government and such easement would interfere with the purpose for which they were reserved."

It is apparently only necessary to demonstrate that a proposed construction is a public utility to warrant condemnation by the State to acquire easement on Government lands, and action could be initiated in a Federal court, with the precedents pointing toward a favorable decision. Definition by State statutes of what shall be deemed a public utility is one of the most hopeful and practical means of solving this problem. In the famous case of Clark *v.* Nash (198 U. S. 361) arising in Utah in 1904, the United States Supreme Court affirmed that "where right of condemnation is asserted under a State statute, we are always, where it can fairly be done, inclined to hold with the State courts." This case involved condemnation of right of way for water to irrigate the farm of an individual. Older decisions have gone so far as to permit an individual mine-owner to invoke the power of eminent domain for the purpose of obtaining a shaft-site on land held in fee, when the development of the mine rendered this necessary from the standpoint of economical feasibility. The extension of this principle has been rapid within the last few years, and the statutory declaration of water-power development to be public utilities, coupled with regulations applying to such enterprises when facilitated by the exercise of the power of eminent domain, would seem to be one clean and honest way of providing for a rational development of resources without prejudice to either State or Federal Governments. It involves only the perfecting of rights already existent, and would secure fair and open treatment. It is in line with precedent and the natural evolution of our Government. That difficulties lie in the road may be conceded. The conflicting interests of the varied States, and the unequal development of public opinion and of public conscience in regard to questions involved, make it a matter to be determined on the basis of policy, whether the existing rights of the States be perfected or some wholly new powers be granted to the central Government. Even if, however, it be held best to allow the States to handle the matter in whole rather than in part, the pending legislation is superfluous and therefore unwise.

BY THE WAY.

Mining investments were diseussed illuminatingly before the Finanee Forum in New York, January 19, by Mr. J. Parke Channing. From his leeture the following is abstraeted:

The risks whieh one undertakes in mining are the same, to a eertain extent, that one undertakes in agrieulture. The first is the varying price of the produet; the second is the sudden end of the partieular ore deposit being exploited. The ehance of a coal seam being terminated underground is, of course, a minimum, the main thing being to secure sufficient acreage at the time of starting. The priee of eoal does not vary so very mueh because it is really the cost of production that determines its selling value. Roughly, one may state that the profit per ton on the produetion of soft coal is 10 to 15c.; and on anthraeite probably 50c. per ton. In iron mining the risk is somewhat greater, and was markedly so until the diseovery of the Mesabi iron range in Minnesota, with its enormous deposits of ore now largely eontrolled by the United States Steel Corporation. It is likely that they have on the Mesabi range 1,250,000,000 tons of ore aetually developed by shafts and drill-holes, while on the older ranges, whieh have been operated for the last forty years, it is doubtful if there is actually visible more than 250,000,000 tons of ore. It is the ownership of these large tonnages of iron ore, and of the large aereage of eoking eoal that puts the United States Steel Corporation in such a strong position.

The next group in which the risk is greater, and, eonsequently, the returns should be greater, are copper mines. The average eost of produeing eopper is probably 10e. per pound, the minimum being 7½ and the maximum being 12½c. per lb. The priee of copper has fluetuated from 11 to 25e., but one may figure the average priee at from 14 to 15c. per lb. For a number of years, with the possible exeeption of sueh regular deposits as those of Lake Superior, there was a great deal of risk in eopper mining, and there were violent fluetuations in the priee of eopper-mining eompanies' stocks. The geology of the deposits was not understood, the partieular phenomenon of what is known as seeondary enriehment having been unreeognized. It frequently happened that when a mine got below this level, large sums of money were expended in looking for the downward extension of the rieh zone, whieh existed only in the imagination of the manager. Within the last six or seven years attention has been turned toward the so-ealled disseminated orebodies, and there are now half a dozen mines in this country whose proved tonnages are ealculated in the millions. This type of property requires a large initial investment and considerable time for development and equipment, but when in proper shape is one of the best mining investments whieh is known.

Gold mining is always in a eategory by itself, and is a favorite of the English publie. The tendeney now in gold mining is toward the development and exploitation of low-grade deposits in which a relatively large tonnage is exposed and available for treatment.

Silver mining at present is rather more speculative than any other, not only on aeeount of the tremendous fall in the value of the product in the last twenty years and the fact that a large proportion of the world's eonsumption is produeed as a by-produet in the produetion of other metals, but also from the fact that the strietly silver mines themselves are always irregular in oeenrrenee. As showing this, last week there was a certain silver mining stock selling at $9 per share, which was paying a dividend of $2 a year, and a eertain eopper stoek selling at $90 per share which was paying a similar $2 a year dividend. In eaeh ease the question of security and probable life were the governing faetors in determining the priee, though I think that, as often happens, the publie had gone to the extreme in each ease, and that one mine was selling at too low a valuation, and the other too high. Still, however, one ean say that without doubt a stock paying $2 a year and selling at $9 was doing so for the reason that it was a question as to how long it would last. In this connection it is probably not improper for me to say that the mineral reserves of the world and of this eountry are not unlimited, and that I strongly believe in the conservation of our metallie resources as mueh as I do in eonserving our timber resources.

In determining the value of a mine two main points are to be eonsidered, first, the net profit in the amount of ore which the mine has developed, and, seeond, the possibilities of finding other orebodies. It is this possibility of finding new orebodies, or the extension of old ones, whieh makes a mining investment so desirable to people who know, and whieh holds forth sueh glittering possibilities to the man who first reads the glowing prospeetus of the old-time promoter. If the investor will study mining conditions and mining reports in the same way that E. H. Harriman and Edwin Hawley in their early days studied railroad reports, and will get an idea of values and disregard prices, he will find that mining investments give one of the best returns that ean be found. The investment of money in prospeets must be left to those people who are distinetly in the mining business, or to development companies that ean afford nine failures out of ten efforts.

When you come to study a mining investment look first to the question of the amount of ore whieh the property has developed, and the profit per year whieh it can make. Take into consideration the faet that if no ore were found during the five, or ten, or twenty years that the mine will exist, not only has it got to pay you baek interest on your money, but to return your capital. When you buy mining stoek take this into consideration, but do not let it be the whole point governing your investment. From the reports of the engineers or the manager, take into eonsideration the possibilities of finding further ore. If these possibilities are good, and if at the same time you consider that the price of the metal whieh this mine produces is going to advance, then you eertainly have a good investment. One can get into few businesses and get 6% return, have absolute security, and at the same time a chance of having the business and the profits double or treble as is often the ease with good mining investments.

MINES OF AJUCHITLAN, QUERETARO, MEXICO.

Written for the MINING AND SCIENTIFIC PRESS
By SAMUEL J. LEWIS.

The mines of Ajuchitlán are situated in the district of Tolimán, State of Querétaro, Mexico, about 25 miles northeast of Bernal station on the National railway, and a little more from the Central. They are reached by coach over good roads from Tequisquiapám, the little town near the railroad. The country generally is a level plateau about 6000 ft. above sea, traversed at considerable intervals by ranges of rolling hills with a general east and west

Fig. 1. Pena de Bernal.

axis. From the mines, the mountains of El Oro are in sight, about 65 miles to the southeast.

The principal mines, worked by the Ajuchitlán Mining & Milling Co. of Monterey, are near the head of a gently sloping arroyo with rather steep sides, the latter due to the bluffs of andesite-capping overlying the steeply tilted shales. These latter form the country rock, and strike generally northeast, with a dip varying from 50° to vertical. Erosion has been active. The shales are exposed below the capping for at least 1800 ft., and the andesite itself is deeply pitted. Silica nodules have been left comparatively unaffected on the surface, while the surrounding feldspar has been cut away. Cooling cracks in the capping are abundant on the tops of the bluffs. The local uplift containing the mineral veins is practically a single widely extended, many-spurred mountain, striking northwest, and evidently close to one edge of the great andesite flow that once covered hundreds of square miles in this country. Beyond this mountain, to the northeast, is visible but one important vestige of capping, the solitary butte known as the Peña de Bernal. This is a remarkable structure. The upper pyramidal portion, vertically scored with marks resembling flow-lines, is of soft red andesite, resting unconformably upon darker, more bluish andesite, the latter presenting the appearance of being stratified; the planes have a dip of 45° southwest. The same stratified appearance occurs near the top of the Ajuchitlán mountain, on the side facing the Peña. It is probably due to slow cooling and consequent more perfect crystallization. The rock of the pyramid is identical with the red andesite found on the crown of the main hill and scattered over the slopes above the 250-metre contour (Fig. 3). Below this level a much harder, more compact bluish andesite is found all over the ridges, giving a ringing sound when struck. The difference in the two kinds is so marked as to suggest two successive flows. The lower andesite of the Peña can be followed westward down into the arroyo, disappearing under vertically dipping shales, evidently much vulcanized. Detailed study might quite probably show the Peña to be a plug marking a former centre of volcanic activity. To the north of the butte, a few hundred metres, appear low red bluffs of the same upper andesite, apparently capping brown shales. This seems to be the northeasterly limit of the capping.

As the shales are followed down to the bottom of the arroyo they become soft and brittle, and undergo startling changes in color through every shade of gray, black, brown, and red. About 500 metres north of the Peña, near the Chica Roma arroyo, the confusion of dips is so great through all angles to 90°, principally near the latter, that the immediate neighborhood of a centre of disturbance is at once suggested. Near the bottom of this arroyo is the only place in the district where the basal limestone is exposed upon which the shales were laid down. It lies with a dip of about 25° to the southeast, the shales above it being only about 250 ft. thick. It is a dense, fine-grained, hard blue limestone, traversed where exposed in the arroyo by innumerable calcite veinlets. Old workings in the hill at this point, going north, penetrate the same limestone with the dip unchanged, at 20 metres distance. It is probable that the original mountain crest was here, before the overflow covered the country.

Fig. 2. Ajuchitlan Mines and Mill.

The west side of the main hill is shown in Fig. 2, with the mines of Ajuchitlán one above the other in the centre. They closely follow the dip of the vein-system. The large upper dump, to the north, marks the old Santo Tomás mine, the original discovery found and worked by the Spaniards. Remains of their old arrastres are still to be found in the arroyo, and some of their characteristic narrow low workings are intact in the mine. At this point the deposit is a flat 'blanket' going into the hill at about 15° for a distance of about 200 metres. Both the early owners and their Mexican successors goph-

ered around in it looking for rich pockets, never getting very far from the surface. Nearly everything shown by the labyrinth of old workings averages $8 to $9 United States currency in value, consisting of about 60% gold, the rest being silver. The high-grade pockets were exceedingly rich. In 1901 the Mexican owners sold the property to an American company. Development has been in progress since, coincidently with the building and operation of a cyanide mill. The latter has been running about three years, and is now being enlarged. The new owners left the old mine, after about two years' study, and began work on the quartz outcrops below it. The large dump noted below and to the south of the old mine, is the upper tunnel or new mine. This has developed very large orebodies, containing ore of satisfactory value. Below it is seen the mouth of the lower level, used entirely for tramming ore to the mill.

The upper level, 41 metres in elevation below

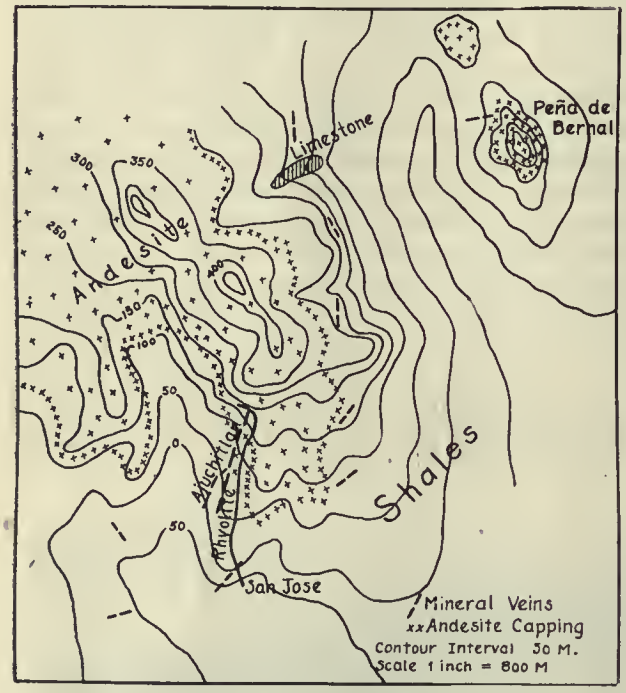

Fig. 3. Region Surrounding Ajuchitlan.

Santo Tomás, opened up the so-called Calavera vein, and led into what seems to be its intersection with the Santo Niño. The resulting orebody was large, and averaged about $8 United States currency in assay value. Here the first fault was encountered, a relatively minor disturbance, which threw the vein slightly to the west; this being related to an igneous intrusion to be described later. Assay values in the immediate neighborhood of the fault rose to $25 and more. Beyond, as work proceeded, two similar faults were encountered, with a like effect on the content and showing the same proximity to the igneous dike mentioned. From an assay value of $2 or $3 or less on the outcrop, the grade of the ore has risen steadily to about $8 in the Santo Niño vein and thence with slight variations to an average of $12, maintained now for over a year. At but one of the faults, the last, was the throw sufficient to make the picking up of the vein difficult. For the most part it has averaged a width of 9 metres. Both walls are usually well defined as highly calcareous shales dipping about 50° to the east; the foot-wall is overlaid by a few inches of barren quartz, below which is sometimes found iron-stained limy material. A similar iron-stained breccia is found next to the hanging wall, and gives high assay values occasionally. A rich stringer follows through it, re-appearing at intervals. Near the present face the foot-wall is as smooth as masonry for many metres. At other points it blends into the country.

The ore has been blocked for about 50 metres above this level, and connection has been made through barren shales with the old mine. Below the level, ore-chutes and air-connections have been carried down on the vein 55 metres in vertical distance to the level of the lower drift. This, begun after the new mine was opened, is in ore except for the first 100 metres, which pass through drift and shale, cutting the vein in the foot-wall. The total length of the level is now about 650 metres, practically all driven by hand. Air-installation is planned for the immediate future.

The grade of ore found here varies from $4 to $6, with unmistakable signs of downward leaching and secondary enrichment. Sinking has been begun near the face, following down on the vein, to reach a zone of secondary enrichment. The indications are favorable that this will be found, judging from conditions at the neighboring prospect known as the San José. The prospect, which is of great interest, lies about 900 metres to the south of the Ajuchitlán mines and lower by 42 metres at its shaft collar than the level of the lower drift. The property is small, entirely developed by an 80-metre shaft in the hanging wall. After cutting the vein at about 55 metres, water became troublesome and now fills the lowest 15 metres of the mine. Two main drifts on the vein-system at different levels have developed about 110 metres of mineralization, striking N. 60°E. Two cross-cuts totalling 40 metres, on opposite sides of the lower level, are entirely in mineralized shales, with the hanging wall well exposed and the foot-wall not yet reached. It is visible only near the mouth of the prospect, as unaltered brecciated brownish shales. Those of the hanging wall are blue, thicker, and harder. The assay values average about $3 throughout the orebody till the neighborhood of the shaft is reached, when there are sporadic but recurrent rises to $7 in value. Near the bottom of the shaft considerable $18 and $20 ore has been found, on which a small and inefficient mill was run till financial difficulties paralyzed the operations.

The notable size of this block of mineral, totalling probably half a million tons, in such a small space, with the permanent water found, indicates a drainage system of considerable extent. The nature of the formation is well shown in Fig. 4, a photograph of a portion of the outcrop of one of the two veins which intersect to form the orebody. The parallel layers of altered shales, slightly separated by bands of quartz, are characteristic of the orebody throughout the prospect. In general features, the property is closely allied to the Ajuchitlán vein-system. The only essential structural difference is in the degree of disturbance suffered here when the original water-channels formed. The latter mines seem to

have been close to the centre of uplift, the fracture forming a fissure of some size, in places quite open. The ore formed here is in relatively concentrated form. In the San José, farther from the uplift, there seems to have been merely a loosening of the shales along their stratification planes, over a considerable area. Ore-bearing solutions percolating through mineralized loosened shales, depositing occasional higher-grade pockets; and meteoric waters have since leached the upper portions of the vein to enrich the lower. Since the erosion of the andesite

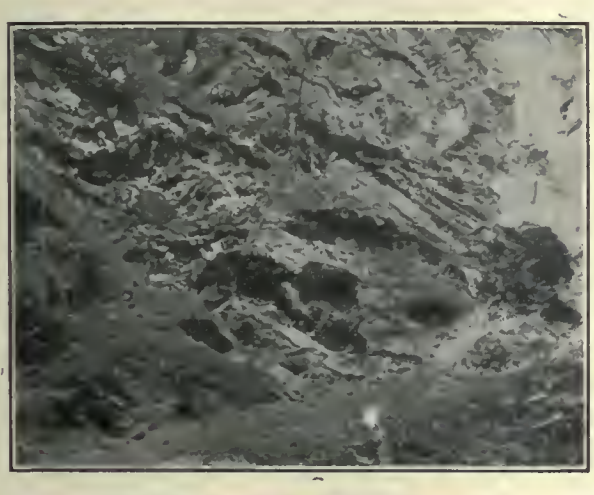

Fig. 4. Outcrop of North Vein, San Jose.

capping, leaching of this vein has certainly proceeded rapidly.

Two shafts sunk in the arroyo by the Ajuchitlán company in search of water for milling purposes, supplement this evidence. Both were successful, and from one of them, near the San José ground, all the water is pumped for the 65-ton mill and about 500 employees. The conditions seem to indicate continuance in considerable depth for both properties. The workings in the new mines of the Ajuchitlán company totalling some 1100 metres of main drifts, have developed about 250,000 tons of ore with assay values from $7 to $12. The old mine has in sight about 150,000 tons of $8 to $9 ore.

The original orebodies seem to have been formed by an uplift which fractured the shales along the line of the present veins; the shales on the opposite sides of the mountain indicate this also by their dip. The tearing apart of the strata was accompanied by much vertical oscillation, as shown by the crushed condition of most of the vein. Fig. 5 shows a specimen of characteristic breccia, assaying about $12 from the vein-stuff now being stoped. At the point where it was taken the orebody is 9 metres wide, the precious metals being uniformly disseminated. Study of the specimen at once establishes the presence of the two factors, movement and water. The whole is cemented by a lime-silica deposit. Occasional small but perfect quartz crystals in open cavities are found. Banded structure, due to successive depositions is shown, the dark bands being rich sulphides of silver, containing gold; the white between being quartz. Through the sulphide bands pass minute veinlets of green iodo-bromides of silver, where oxidation has proceeded. The vein as a whole is thoroughly oxidized, the residual sulphide nodules showing as black specks. Some fine specimens of bromargyrite have been found here, practically all the silver being in this form. Chlorides are rare, occurring only as small isolated crystals.

The extraordinary condition of the orebody in the Santo Tomás mine has made the problem of origin difficult. The thick sheet of ore found there, nearly horizontal, capped by shales, and in places horizontally parted by strata of shale, ends abruptly in the country rock, and seems a body independent of all others. The important developments which brought it into relationship with the main vein-system were two: a cross-cut northeast through the barren shales from the apparent end of the 'blanket', meeting the vein of the new mines at about 40 metres distance, and a drift in ore, near the northern end of the 'blanket', which follows the deposit uninterruptedly through a change from the horizontal to the normal dip of the main vein and into it. These facts establish the Santo Tomás orebody as an immense dislocated fragment of the original vein, torn bodily from the parent structure at the southern end, and moved about an axis near the northern. The shales overlying the blanket could only have come from the former hanging wall of the structure. Overhead winzes pass through them to daylight, and in the further parts of the orebody reach the broken and decomposed bottom of the andesite capping. Slickensides abound, with every angle of dip. The ore in the Santo Tomás is much decomposed as if by action of water. Great brecciation of both shales

Fig. 5. Characteristic Breccia Main Vein.

and ores is found, most conspicuous in the immediate neighborhood of the parent vein. The whole orebody is out of place, and originally occupied a position fairly coincident with the vein as later developed. The origin of the dislocation is in the igneous intrusion previously alluded to, which will now be described.

Reference to the map, Fig. 3, based on my own surveys, will show what seems to have been a dike of rhyolite, which traversed the shales from north to south, opening a fracture having a present width

of one metre. It is now filled with highly decomposed gouge, in which are embedded fragments of rhyolite, some of it quite undecomposed, rounded by abrasion. The rock in fracture shows a coarse ground-mass of feldspars in which are plentifully embedded beads of unaltered glass, averaging $^1/_{16}$ to $^1/_8$ in. diam. It is found as abundant 'float' on the surface along the west slope of the spur, as shown; never on the low ridges closing the mouth of the valley nor above the level of the Santo Tomás. Underground, it has been cross-cut in workings driven east from the vein, in the new mine, and as a capping in the inner workings of the old. In all cases, its presence in the new mine has accompanied slight displacement of the vein westward. In the case of the first fault, the rhyolite came in as a horizontal fold or nose, which pushed the vein westward to correspond. As the nose receded eastward, assuming its general dip, of about 60° northeast, the vein also recovered its normal dip. The dike seems to have come upward and outward from somewhere near the Peña de Bernal, paralleling the vein for some distance, and finally cutting across it completely. In the upper tunnel and drifts below it, the workings have clearly defined it at several points as curving round in a northwesterly direction. The vein is completely cut off, the contact being strongly slickensided and striated; on the other side, the drift is in a conglomerate of andesite fragments and boulders. About 30 metres have been driven on the general strike of the vein, and fragments of quartz containing payable silver and gold are being found. The vein should be picked up with little further driving, probably will be, but little dislocated. Where encountered in the workings, some 15 metres below this point, no andesite fragments whatever appear. The dike cuts across at about N.80°W., the vein being much broken and discolored for about 5 metres south. Beyond, fragments of ore and quartz clearly indicate the proximity of the unaltered vein, and help to explain the nature of the obstruction above.

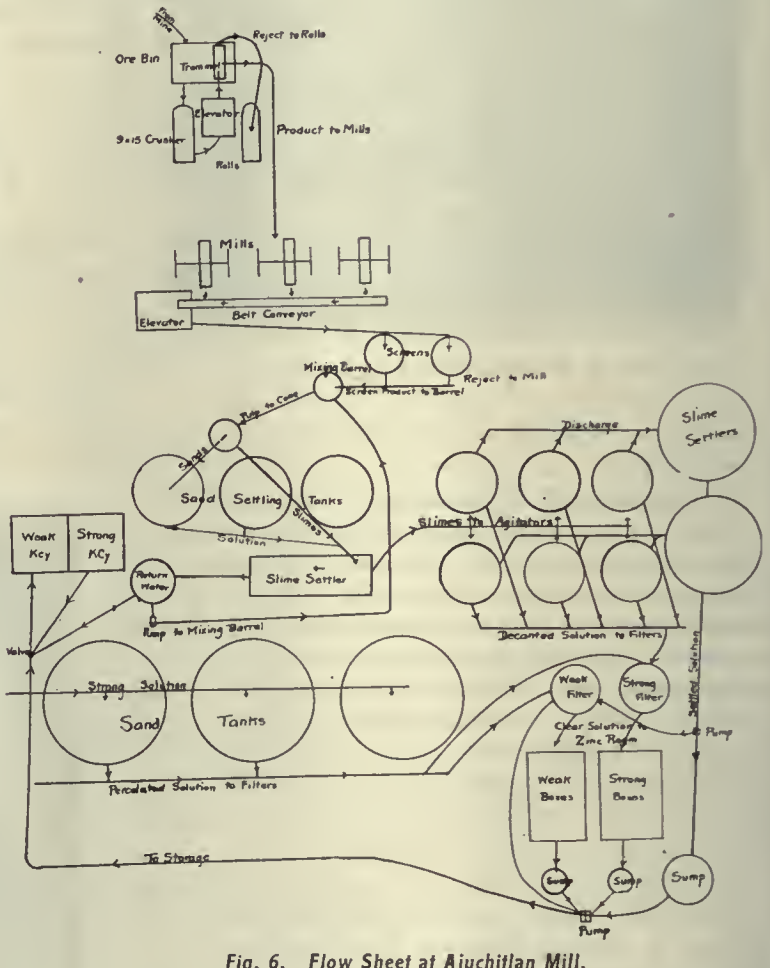

Fig. 6. Flow Sheet at Ajuchitlan Mill.

Study of the surface above the face shows a slip in the capping along a line about N.70°W., closely corresponding in direction and location with the line of the dike below. The slip is local, confined entirely to what is now a little hollow behind the rugged andesite bluff above the mines, excellently shown in the general view, Fig. 2. The photograph shows the break well, contrasting with the rounded outline usually shown at the edges of the capping. The entire absence of rhyolite fragments from the surface of the capping, of itself indicates that the dike antedated the latter. It seems clear that the igneous intrusion came to the original surface, becoming itself a channel for the circulation of meteoric waters, which in conjunction with the grinding and settling along the walls of the crack, produced the rounded pieces of rhyolite we find in it today, embedded in damp clayey gouge. A unique piece of rhyolite found on the surface shows complete replacement of the ground-mass by hard smooth ivory-white quartz, banded in concentric layers, with the gas bubbles intact. The andesite flow, conforming to the topography at that time, deposited a thin sheet over the present arroyo, then the ridge, and filled more deeply the hollow places above the present vein-system. Once the thin sheet of andesite was broken, erosion on the soft shales must have been rapid and destructive, carving out the present valley and causing blocks of the capping to split off and fall as it became undermined. The process can be seen going on today, leaving cave-like openings at the foot of the bluffs. When the gradual advance of the erosive agencies reached the zone that had been fractured by the dike below the capping, a line of weakness developed along its course. The abrupt fall of a relatively large portion, taking with it vein, shales, and dike, with the original surface drift, could be only a matter of time. All the physical peculiarities of the zone clear up when referred to this slip. At the same time, there is observed on the present surface a large block of andesite which from the angles of its parting planes and its tilt is certainly not in place.

The grinding of this extremely hard ore for cyanidation has been the difficult feature of the milling practice here. The solution has been found in mills of the triple-roll and die type, which reduce the ore to about 60-mesh. The flow-sheet shows the practice in detail. After preliminary breaking in the crusher and rolls, the ore is ground, delivered by belt and bucket conveyors to the screens, and there sized on

specially designed impact-screens of conical shape, which have great capacity and are uniform in action. The oversize is re-ground, and the finished product is delivered by belt-conveyor to the mixing barrel, where it meets the cyanide solution pumped from the return-water sump. This takes out about 40% of the metals in carrying the pulp to the classifying cone. There the sand and slime separate, going to their respective settling tanks. The clear solution with metals all goes to the return-water sump, where a centrifugal pump delivers it to the mixing barrel, together with the added fresh cyanide solution. From this point the slime is treated in mechanical agitators of the rotating arm type and the sand is leached by successive washes. Precipitation is effected with zinc in the usual form, the clean-up every 10 days yielding precipitate about 860 fine. The mill-heads are kept up to about $12 United States currency, in value, and the treated sand and slime, carrying about $3, are being stored awaiting the installation of tube-mills. The present plant, having a capacity of about 2000 tons per month, is being remodeled to crush 3000, and with the installation of fine-grinding machines the capacity will be increased. Electric power is used throughout, the current coming from the line of the Cia. Hidroeléctrica Queretaña, 25 miles across country. Separate motors drive crusher, mills, and agitators, and an electric pump furnishes the water. Costs at these mines have been kept low. At present, with the price of labor higher than a few years ago, drillers get 75cv. per day, peons, 37 to 42, mill-workers, 30cv. to ₱1.25. No timbering has been necessary in the mine. The ore is stoped, mucked, and trammed to crusher for about ₱2.10 per ton; milling costs about ₱3 per ton, and general marketing and miscellaneous expenses bring the total to about ₱6. Facilities for study of this property were courteously accorded by Cliff Crowell, the general manager.

Explosives are being used in increasing quantity and variety. They are now made at 150 plants in different parts of the country, and the product of a single year is now nearly 500,000,000 lb. Of all this material no explosive is safe in the hands of a careless or ignorant person, whether it is used in mining or otherwise. Statistics recently compiled by the railway bureau for the safe transportation of explosives show that more than 400 persons have been killed or injured, and over $3,000,000 worth of property destroyed by explosives in transit by rail. The fact that three years of co-operative effort under the supervision of this bureau have reduced these losses to almost nothing should encourage the hope that similar co-operative effort may likewise greatly reduce losses of life and property from the use of explosives in mining.

The Pachuca tunnel is a plan to run a bore about 12 miles long, at a depth of 1000 ft. below the lowest level of any of the mines in Pachuca, Mexico, and to cut them at that depth, which would be about 3000 ft. below the surface. The main veins to be tapped would be the Santa Gertrúdis, the Real del Monte, and the Barrón.

ELECTRIC DRIVE IN FOUNDRIES, WORKS, AND MINES.

Written for the MINING AND SCIENTIFIC PRESS
By HUBERT A. CARTER.

The large annual increase in brake horse-power in motors installed in foundries, works, and mines, in Europe and the United States during the last few years is striking evidence of the fact that the advantages of the electric drive over other means of power-transmission are rapidly becoming recognized. Where electric driving is suggested the engineer endeavors to arrive at an accurate estimate of its advantages by making a rough calculation of the number of units he will require, multiplies that number by the quoted price per unit, and in this way arrives at his total annual bill for power. This total he compares with his calculated cost of power by steam or gas-engine. A calculation of this kind is, as a rule, rendered defective by the difficulty of ascertaining exactly what horse-power the tools require. Estimates based on the horse-power of the engine should not be taken into consideration, as, owing to belt and transmission losses, and to other factors, they are certain to be greater than the maximum needed if electric driving be resorted to. It is quite as erroneous to estimate the horse-power which each machine is supposed to take and then multiply the total by the total working hours. In practice most machines work intermittently, and their actual total consumption of energy may probably be less than half what it would be if they were worked continuously at full load. With an isolated power-plant which must be kept running constantly, the benefit of that difference is not obtained, but with electric driving from the public mains the power paid for is the power used by each machine in useful work, and it therefore varies almost as directly as the load. Most power users find that the units of electricity which a works is likely to absorb in a year are much lower than expected.

In the case of iron works the argument based upon the intermittent working of machines is very strong. The cranes, rolls, drills, and miscellaneous tools may be said to be 'off and on' all day, and it will be found in most cases that the only economical way of dealing with the situation is to have a source of power which is cheap under both heavy and light loads. Steam or gas-plant is only economical at full load, while light loads are wasteful. With electric power the cost follows the actual work done. Many iron works are forced to use an isolated number of steam-plants, at times fed with steam from a central source. Although such an arrangement may be convenient it is immensely wasteful. Owing to the intermittent demands and the scattered arangement of the plant, the economies of electric driving will be appreciated by iron works. The saving effected in any fair-sized plant will in the course of a year be astonishing as to up-keep, supervision, insurance, and so on. The electric supply arrangements should be made so as to ensure continuity. A three-phase current of 10,000 volts should be conveyed to such works, and on the premises the pressure transformed down to a working level of about 400 volts. A duplicate supply, provided by means of a second connection to the trunk

mains, constitutes a great assistance to the easy continuous working of the drive. A good arrangement is to control the actual supply to the various motors from a switchboard on a lower floor at the sub-station, and to have six separate circuits, which can be labeled A, D, E, H, K, and L respectively, each of these circuits with a sub-distributing board in a convenient position for the control of a group of motors; each motor in turn to be on its own separate circuit leading up to the distributing board which controls it. This arrangement enables the supply to be regulated in whole or in detail, with perfect facility. Circuit A might consist of 7 motors, with a total horse-power of 100; circuit D of 11 motors totaling 147 hp.; circuit E of 7 motors of 135 hp., and so on. The speeds might vary from 470 to 1410 rev. per min. Spares should be included. With electric driving it is easy to test the exact amount of power which each motor or machine is using, and by this means perfect check is kept upon the behavior of the machines, and any mal-adjustment or defect detected at once. The electric drive can be made much safer than the mechanical, reducing the risk of accident; it also does away with the obstructions and makes the supervision of labor easier.

In regard to saw-mills, J. F. C. Snell, who was until recently the electrical engineer at Sunderland, England, and who has had wide experience with electric power in its practical aspects, stated that in one case where a saw-mill was driven by steam-engines the cost was over 2d. per horse-power, or 2s. 6d. per unit. Seven motors were installed, ranging from 4 to 50 hp. each, with a total of 179. After one year's run it was ascertained that the total consumption was 50,785 units. The electric company furnished the static transformers and the high-tension switchboard, the low-tension switchboard and fireproof-transformer chamber being found by the user. The cost to the consumer was as follows: electricity £264 10s. 2d., oils and stores £9 3s. 4d., interest on sub-station building £12; total £285 13s. 6d., of 1.35d. per unit, exclusive of capital charges on motors and wiring.

The peculiar features in building work and kindred operations, show the advantages of the electric motor as against steam, gas, or oil engines strongly. Much of the work, as in cranes, is intermittent. The electric motor, which takes power only when required, is the only means of dealing with such work economically. Steam has to be kept up continuously no matter how often or how seldom the crane is actually used. Crane engines are not large, and require to be run non-condensing, hence they are by no means efficient, not taking into consideration the great waste of power during idle minutes. For traveling cranes, which are so important a feature in builders' yards, the electric motor stands unrivaled. In stone crushers, and other like appliances, the load varies greatly, and there is the risk of occasional heavy overloads. The electric motor can deal with these overloads without difficulty. When the load is light it will be found to run far more efficiently than the steam engine under the same conditions. Another important point is the ease with which motor-driven machines may be placed at convenient points in yards, or on building sites. The necessity of considering arrangement of shafting or of crowding plant together does not arise.

The largest sheet and wire mills for precious metals in London, and the first that were electrically equipped throughout, are those belonging to the firm of Johnson, Matthey & Co., in Hatton Garden, where 300 hp. in brush-motors is installed. The business is concerned with refining and assaying, as well as the melting, casting, rolling, stamping, and drawing of gold, silver, platinum, and other metals, and the largest gold and silver-smiths in London, Birmingham, and elsewhere, are supplied from these works. The first motors were installed in 1903 by the British Electrical Engineering Co., of Longhborough, England, and have fully demonstrated the superiority of electric driving, especially on account of the uniformity of gauge obtainable. Gold can be drawn, for example, into wire measuring $^1/_{1000}$ in. diam. in almost any length required, and this is impossible without electric driving. Similar success has been reached by electricity in rolling, flattening, and other operations.

Recent accidents in English collieries have been caused by defects in the winding machinery, and miners think that the tendency to increase the speed of raising and lowering has a good deal to do with the growth of accidents from this cause. There is a direct and simple means of making the winding engine one of the safest parts of a mine equipment. Modern electric winding-gear is so well devised that the danger of accident is practically negligible. The German Government, which is extremely careful about the safety of workmen, permits electric winding plants to haul men at the rate of ten metres per second, as against the maximum of six metres per second for steam-winding. A fact like this is of great significance to both mine-owners and miners generally. Electric plant for collieries is made enclosed to protect it from coal-dust; for other mines this is unnecessary. Many colliery owners have the same ideas about cheap coal and pit-heap refuse as engineers used to hold about water-power, namely, that it is so cheap that economy need not be considered.

With mines generally there exists the problem of transmitting the steam to the uneconomical engines which use it. It is not altogether the fault of the engines that they are so uneconomical, for the steam is frequently delivered to them so wet that it might be wondered whether they were expected to work as steam engines or hydraulic motors. Many of the steam pipes in collieries and mines, are bare, and at best imperfectly covered. The loss due to radiation even in covered pipes is considerable, while in uncovered pipes it is a most serious drain on the boiler plant. From tests made in a colliery in the North of England it was found that with steam at a boiler pressure of 100 lb. per sq. in. the condesation in well covered steam-pipes in the pit-shaft was at the rate of 1 lb. of steam per hour for every three square feet of pipe surface exposed. A pipe 3 ft. in circumference is quite a moderate size in the case of a colliery—less than 12 in. outside diameter—yet for every single yard of length the boilers must raise 3 lb. of steam per hour during the whole time the steam is turned on, in addition to that used by the engines, regardless of whether the engines are working or not. For such

a pipe carried down a shaft 1000 ft. in depth it would be necessary to raise 1000 cu. ft. of steam per hour for no other purpose than that of keeping the pipe warm. But steam-pipes are often carried to pumping engines in mines over much larger distances than this, and in the case of the colliery referred to it was all that two Lancashire boilers could do to raise sufficient steam to make up for the condensation in a range of 6-in. pipes leading to the underground pumps. This meant two boilers going continuously, and probably one as a stand-by, with all that this means in up-keep, firemen's wages, wages of men delivering and dumping and removing ashes, cost of flue and chimney cleaning, cost of feed pumps, water, and oil, to say nothing of the cost of coal, and the fixed charges, such as interest and depreciation on boilers and chimney stack. Then the condensed steam had to be pumped up again. It appears incredible that two boilers should be used to pour water down a shaft while adjacent boilers have to provide the necessary steam to pump it up again. It is not surprising, therefore, that great economies have resulted from the adoption of electric-driven in place of steam-pumps for underground work. In one case the substitution of electric pumping plant, costing £3500, effected a saving of over £1200 per annum. In another the adoption of electric motors to drive existing pumps previously driven by wire-ropes from engines and boilers situated underground, effected a saving of £1500 to £1800 per annum, the cost of the electric installation being £3000. In yet another instance the substitution of a three-throw electric pump for one spear-rod pump and two duplex steam-pumps effected an annual saving of £3000, with a capital cost of £6000. In this case steam-pipes originally ran for about 800 yd., and one result of the electric drive was to reduce the coal consumption from 14 to 2¼ tons per day, and the number of men employed from 7 to 3. Such instances might be multiplied, but it would be hardly possible to bring more convincing proof of the economies which may be effected by the adoption of electric pumping in collieries and mines generally than is afforded by the above examples.

Centrifugal pumps in a large colliery in Wales, driven by two Westinghouse 3-phase, 3000-volt, squirrel-cage motors, 125 and 50 hp. respectively, have been found capable of pumping a supply of water for coal-washing purposes amounting to 3500 to 4000 gal. per minute. Two switch-panels control the motors, and both motors are coupled direct to the pump-spindles. The smaller pump works intermittently (without suction) against a head of about 35 feet. The larger pump works under suction from depths varying from 15 to 30 ft., and delivers its water in two stages.

The conversion of mines to electric working need not be carried out in one move. It may be, and very often is, done piece-meal, the experience gained with an experimental installation for pumps, ventilating fans, or haulage, being used to demonstrate the scale on which economies may be effected. The characteristic features of the mine-problem are the long distances over which power has to be conveyed, and the difficult points at which it is often necessary to install pumps, fans, and other plant requiring a considerable amount of power. A flexible electric cable is one way in which energy can be supplied under these conditions without loss. With electric power, however, enormous steam-loss is eliminated, as the loss of energy in an electric cable 1000 ft. in length is next to nothing. The electric motor is a high-speed machine, and its first cost per horse-power is lessened as the speed is increased. Seven large collieries in Yorkshire, England, have lately adopted electricity for pumping, haulage, ventilating, coal cutting, and so on, in spite of the fact that they have an endless supply of power in the shape of coal. The same advantages apply in the case of machinery used in metal mining. The drive is noiseless, steady, and far more economical than the use of steam. The ventilating problem is similar in its general aspects to that of pumping. In both cases power has to be applied at distant and inconvenient points. Owing to the small space occupied by the electric motor it is by far the most easily installed, while it has a crowning advantage in the certainty of control from any desired point. Electric motors may be readily protected against moisture and heat, and they may, if necessary, be arranged to work when totally submerged in water. When properly designed and installed, there is no machine less liable to breakdowns.

From the point of economy there is nothing to compare with the electric fan. The loss in transmission from the switchboard to the most remote parts of the mine is trifling, and the efficiency of the motor-driven fan is high. Electric haulage presents a more intricate problem, owing to the diversity of conditions. The claim made for electric haulage is not only that it is more economical, but also that it enables a marked increase in the output to be obtained without corresponding increase in the working cost. The main feature of haulage work is the variability of the load, due to the unequal loading of trucks. The derailment of trucks may double the demand for power in an instant, and unless the capacity of a steam-engine equipment is twice the normal (a most costly and wasteful arrangement) the engine will be stalled, and time will be lost. The electric motor, on the other hand, is quite capable of taking double its rated load for short periods, and will take excess loads up to 50% for a considerable time. This enables the motor to work economically under normal conditions, and to handle overloads with ease and efficiency. With steam and other power-equipment an increase in load tends to reduce the speed of the engine, whereas an electric motor will maintain constant speed within a few per cent from no load to full load. It is this virtue of the electric motor which gives a higher average speed with a fluctuating load, and therefore increases the capacity of the haulage system. Steady speed is of great advantage with endless-rope haulage, but the electric motor has another quality which makes it also applicable to main and tail haulage where reversals occur frequently. It accelerates twice as fast as the steam engine, saving a great amount of time during the working day. The electric motor is also ready to start at the touch of a switch, and there exists no necessity for the preparations required to start a steam engine after a period

of rest. Electric driving enables the haulage gear to be fixed in the most convenient place (owing to the limited space occupied), and does away with the wasteful splitting of long drives. Portable haulage gears may also be used where required, and are available in the main-rope and endless-rope types. On the Continent the electric locomotive is coming largely into use. Power is conveyed to it by means of a flexible trolley, which takes current from overhead wires in the manner of an ordinary tramway.

The adoption of the electric drive in gold, silver, lead, diamond, and other mines will prove greater in its money-saving advantages than in those cases in which it is applied to coal mines, as it will be readily admitted that such undertakings have to pay a higher price for fuel than collieries. To this has frequently to be added special railway rates and cartage charges, together with the cost of weighing, stores, and delivery clerks. Even where collieries are still using steam-power a supply of electric current may be put to good use. This is especially noticeable in a week-end supply of electric power whereby the colliery manager is enabled to shut down the boilers, and avoid the costly banking of fires and steaming which is at times required for the ventilating fans only. The fan can be driven by motor from Saturday till Monday, and during the rest of the week the electric motor can be used as a stand-by. The same advantages would accrue in the case of other mines.

In relation to electric winding it may be said that an intermittent and rapidly varying load is badly suited to the steam-engine, and the superiority claimed for electric winding rests upon the several arrangements made for handling such a load cheaply, arrangements which cannot be applied to steam equipment. The main feature of electric winding is regeneration, by means of which a portion of the energy spent in accelerating is made use of during the period of slowing down. The arrangement may be likened to a pendulum in which the energy accumulated during the downward swing is absorbed in the upward swing which follows. The benefits of regeneration in winding are obtained by utilizing a heavy fly-wheel. Instead of stopping the cage by means of brakes it is stopped by allowing it to give up its energy to the fly-wheel, and this stored energy can be used to accelerate the cage at its next movement. By an ingenious development of this principle an electric winding gear can be driven with a motor generator, the capacity of which is equal to the average load. In all other systems the winding engine must have a capacity equal to the maximum load. Thus an electric winding plant rated at about 450 hp. is able to deal with a load which rises at times to 1200 or 1800 hp. The working economy of this system is obvious, and the problem resolves itself into that of the capital expenditure involved in electric-winding plant which is warranted by the economies resulting in operation.

A statement of the case for electric driving as it stands today would not be complete without reference to the problem as to whether users of electricity should generate their own power or take it from an outside source. They then become largely independent of the fluctuations in the price of fuel, and also of strikes, they are freed almost entirely from anxiety as regards stoppage from break-down, and in some cases the capital expenditure saved on the generating plant can be more usefully employed in productive machinery. A contract is also made for power at a fixed price, as a rule, and a power-user knows exactly what his power is costing him month by month, and year by year, machine by machine. In a mechanically driven undertaking one can only estimate the horse-power which each machine takes, and in any form of separate generating plant there is room for diversity in the estimates of the actual capital expenditure on land, buildings, and plant required for power production, and of the current cost of wages, coal-cleaning and maintenance, depreciation, and so on, of the fixed and running plant. Cheapness in the production of electricity depends upon the size of the generating station, the magnitude of the load, and its diversity. Thus a big station supplying a large number of varied demands, and so reaching a considerable and even output, can produce its units of electricity cheaper than a small station supplying only one load. Everyone agrees that the advantage lies with a main-power station. Cases arise, however, where power cannot be obtained from an outside source, and in these the question of users generating their own supply in such a manner as to enjoy to the utmost the proved economies of the electric drive comes up for consideration. Around mining properties, building operations are frequently going on, and electric stone crushers and mortar mixers can be run by electricity, with money-saving results.

Electrical apparatus when constructed in accordance with the best engineering practice is well-nigh indestructible, is subjected only to the ordinary amount of wear and tear, and even comes out unimpaired from devastating floods and fires. The following cases give excellent examples of the amount of hard usage that well made electrical apparatus will survive and still be in good working condition. In the Knight's Deep mine, near Johannesburg, South Africa, there were installed 36 15-kw. transformers and 12 3-phase 50-hp. G. E. induction motors for operating the mine pumps. Through a peculiar combination of circumstances the mine was allowed to fill with water, the motors and transformers running under 100 ft. of water for over two years. When taken out three of the motors were re-wound in the local repair shop, the others were simply dried out, and then soaked in oil. Contrary to expectations the insulation was found to be in excellent condition, and the motors were put into service, apparently none the worse for their high-pressure bath. The transformers were dried in the same manner, and shortly afterward were replaced for transformers of English make which had burned out only a short time after being installed. A railway power station near the Mississippi river was exposed to severe floods during the season of high water. Two 1500-kw. 6000-volt generators were more than half under water for nearly a week, but when dried out carried their load without giving any trouble whatever: in fact the first machine to be dried out carried the entire railway load until the second machine could be put into service.

A TARLESS OIL-GAS PRODUCER.

By A. B. Davis.

*My attention was first called to the Darling producer during the latter part of January 1909, at the convention of the Indiana Gas Association in Indianapolis. I made a trip to Lima, Ohio, where an experimental plant is set up, to investigate the apparatus. In the latter part of February I made a series of tests on the apparatus. Before going into the tests of the results it will be necessary to understand the construction of the producer. Fig. 1 is a sectional

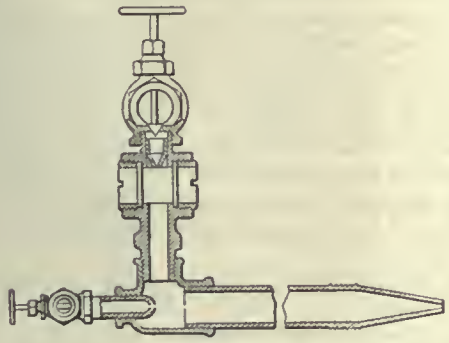

Fig. 1. Oil and Air Nozzle. Darling Oil-Gas Producer System.

drawing of one of the nozzles. Oil is fed through the upper needle-valve and air through the lower one. Both air and oil are under equal pressure. The hole through which the mixture passes is $^3/_{16}$ in. diam. and the air-hole ⅛. A sight-feed glass is provided to regulate the flow of oil. Fig. 2 shows the

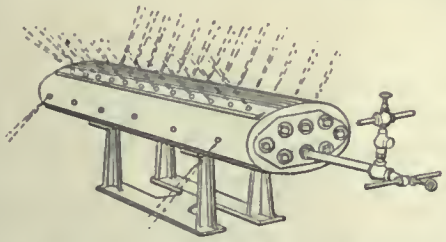

Fig. 2. Burner for Heating Retort. Darling Oil-Gas System.

burner with nozzle attached. It is an iron casting, cored so as to form eight compartments running the full length of the burner. These compartments are arranged so that the mixture enters the bottom centre one (1, Fig. 3), passes the length of the burner and enters 2, traveling back to the front end, entering the two compartments marked 3, flowing back and down into 4, forward and into 5, whence it passes out through a series of holes shown in Fig. 2 and 3. Here it is ignited, being supplied with the necessary air from the opening in the fire-box. The holes at the sides of the burner are arranged so as to direct the gases downward for the purpose of keeping the burner hot. The two upper rows of holes direct the gas upward against and between the retorts, which are placed two or three inches apart in the frame. Fig. 4 is a photograph of one of the retorts with the nozzle in place. The interior construction is similar to that of the burner itself. After the mixture passes through the various channels of one lower retort it is passed through similar channels in an upper one (Fig 5). Fig. 5 shows the front of a 32-retort outfit. The burner is situated below in a fire-box, and the retorts are arranged above in pairs, one over the other.

Both the burner and the retorts are fed with a mixture of air and oil, the burner being kept hot by reflex heat, and the gas formed is burned under the retorts in turn to keep them hot. The gas made in the retorts is taken off at a manifold at the top of the setting, purified and stored in a holder ready for use in any kind of gas applianee. The remarkable thing about the producer in question is that it can be operated without the production of tar, while all other processes known to the author, produeing gas by the decomposition of oil at a high temperature, also produce more or less tar, some proeesses converting into tar as high as 25% of the total volume of oil fed to the retorts. Carburetted water-gas machines convert into tar on an average about 20% of the oil used in carburetting the gas. Several proeesses on

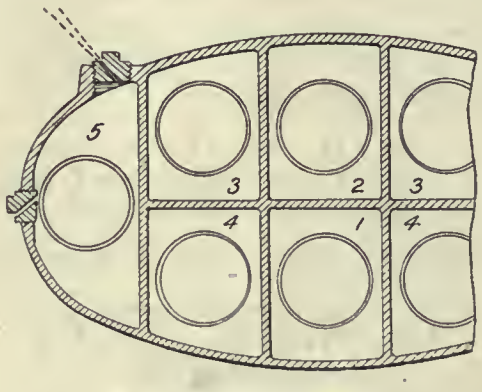

Fig. 3. Section of Burner.

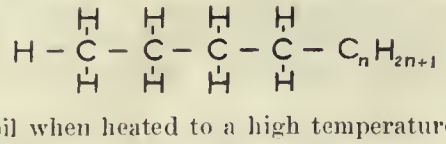
the market, similar to the one under consideration, 'crack up' the oil in a hot retort in the presence of steam and produce large amounts of tar. The question arises, why is it possible to 'crack up' the oil in the presenee of air at a high temperature without produeing tar, while, if steam or inert gases be used, tar is produced? We well know that oil alone in the retort will produce tar, just as in the Pintsch process used to make gas for railway cars. This gas may be easily made with the apparatus described by shutting off the flow of air into the retorts, and then, as in the Pintsch process, about 20% of the oil is converted into tar. After careful study of the eonditions, it has been possible for me to arrive at only theoretical conclusions, which, however, seem to explain the results obtained. The composition of crude or gas oil may be represented by the formula

$$C_n H_{2n+2}$$

or graphically;



The oil when heated to a high temperature shows a tendeney to decompose into hydro-carbons of lower moleeular weight, at the same time producing compounds of the olefine type from the paraffines by causing the oil to drop two hydrogen atoms at one

*Abstract from *Trans.* Ohio Soc. of Mech. & Elec. Steam Eng. Illustrations from *Engineering News.*

or several points in the chain. These olefine compounds may be represented by the formula

$$C_n H_{2n}$$

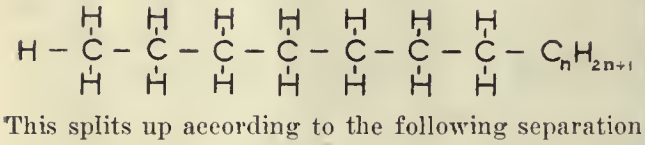
or graphically:

$$C H_2 C H - C_n H_{2n+1} \text{ or}$$
$$C H_2 = C H - C H_2 - C H_2 - C_n H_{2n+1}$$

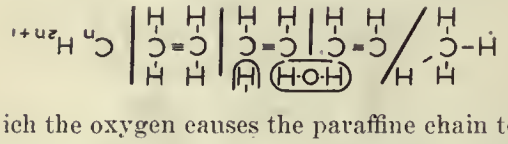
The formation of paraffine oil-tar depends on the polymerization of these high olefines, which always takes place when they are heated to a high temperature. The tar may be represented by the following graphic formula:

$$(C_n H_{2n+1} - C H = C H_2)_X$$

It may be considered a mixture of many compounds, some of which are of very high molecular weights, which have resulted from the combination of the olefines, and the compounds forming the tar may be considered to have one or several benzine rings in the molecule and with one or many side-chains on each ring, perhaps intricately connected among themselves. It has been found that the decomposition of the oil into gas takes place best at a temperature of from 1350 to 1470°F. In the presence of oxygen one may theoretically express the reactions which take place as follows: An extension of the first graphic chain formula gives



This splits up according to the following separation



in which the oxygen causes the paraffine chain to lose two atoms of hydrogen at several points in the chain, causing double linkages that are always weak spots in the chain, which is then broken up by heat into largely ethylene, acetylene, and hydrogen. The presence of oxygen in the retort seems to cause the olefines formed to break down at once into permanent gases without allowing them to polymerize to tar. As proof that such a reaction takes place, we find, from the analysis of the gas, that the latter contains 25 to 30% of gases soluble in bromine water, these being largely ethylene and acetylene, and further that the gas contains little carbon dioxide and carbon monoxide, showing that the oxygen of the air had combined with the hydrogen of the oil to form water, rather than combining with the carbon to form either carbon dioxide or carbon monoxide.

In order to settle more definitely whether or not the conclusions, that the oxygen from the air used, prevented the olefines from the oil from polymerizing, the problem was presented to J. Bishop Tingle, who expressed the opinion that the above conclusion in this matter is probably correct. William A. Noyes, of the Bureau of Standards, made the following statement:

"The explanation which you give for the lack of tar in your process is probably partly correct. I think also that, in the original decomposition by heating, the free valences of the carbon, which under ordinary circumstances caused the polymerization, are saturated by oxygen or hydroxyl, followed by the loss of water in such a manner that the resulting hydrocarbons do not readily polymerize." The importance of this letter lies not in the fact that it partly confirms the views expressed, but in the fact that Mr. Noyes apparently does not for a moment consider the production of gas from oil without the production of tar impossible.

Results of the tests made on this gas producer follow:

Kind of oil used	Lima
Time of run	1 hour
Gas made, cubic feet	1486
Air used, cubic feet, atmospheric pressure	583
Pressure of compressed air in pounds	35
Volume of compressed air, cubic feet	250
Oil entering retorts, gallons	19.0
Oil recovered from scrubber, gallons	8.5
Oil converted to gas, gallons	10.5
Oil entering burner, gallons	4.0
Total fuel and gas-oil for run, gallons	14.5
Total oil, 1000 cubic feet, gas made, gallons	9.76
Total oil used in retorts, per 1000 cubic feet gas made, gallons	7.07
Total oil used in burner, per 1000 cubic feet gas made, gallons	2.69
Cubic feet of air per 1000 cubic feet gas made, atmospheric pressure	398
Cubic feet of air per 1000 cubic feet gas made, compressed	167
Gross B. T. U. per cubic foot of gas made	844.5

CHEMICAL ANALYSIS OF GAS MADE.

	Per cent.
Carbon dioxide (CO_2)	2.0
Illuminants soluble in bromine	25.5
Heavy hydrocarbons	0.5
Carbon monoxide (CO)	1.5
Methane (CH_4)	35.0
Hydrogen (H_2)	5.5
Nitrogen (N)	30.0

If we theoretically consider that the oil used on this series of tests contained 18,200 B. T. U. per 1000 cu. ft. and has a weight of 7.2 lb. per gallon, the following efficiency is obtained:

Heat units of oil used in retorts and converted into gas, that is, 18,200 B. T. U. × 7.2 lb. of oil per gallon × 10.5 gal. used in retorts = 1,375,920 B. T. U.

Heat units in gas made: 1486 cu. ft. gas made containing 844.5 B. T. U. per cu. ft., that is, 1486 cu. ft. ×844.5 B. T. U. = 1,254,927 B. T. U., which is equal to 91% recovery in heat units.

It should be noted that no account is here taken of the oil consumed by the burner. Considering this, the efficiency is reduced as follows:

18,200 × 7.2 × 14.5 = 1,905,000 = total B. T. U. in oil used.

Recovered B. T. U. in gas, 1,254,927.

$$\text{Efficiency} = \frac{1{,}254{,}927}{1{,}905{,}000} = 0.66.$$

The question is often asked as to how the gas works in the numerous appliances on the market. On all gas engines it works perfectly, and in all types of gas lights made for water or coal-gas there is no difficulty in adjusting the lights so that the producer-gas gives excellent results, in many cases the lights from the producer gas being far more brilliant than with coal or water-gas. This is especially true of lamps with Welsbach mantles. There has been some trouble with gas-stoves owing to the

fact that the specific gravity of the producer-gas is about the same as air; in some cases slightly higher. The specific gravity of coal-gas is only about 0.48, and carburetted water-gas 0.65, natural gas 0.55 to 0.6, so that practically all the stoves on the market are made to use a gas which is about one-half as heavy as the oil-gas made by this producer. According to the Bunsen's law, the rates of flow of two gases through an orifice are to each other as the square root of their gravity. Therefore, since this gas is twice as heavy, it will flow as 1 to 1.414, when compared with gas at a gravity of 0.5. For this reason and because of the large quantity of nitrogen present from the air, only the oxygen of which has been used, the small and numerous orifices in a gas-stove burner are not as a rule large enough to admit the oil-gas flowing through rapidly enough and have to be drilled out about 50% larger. Unless this is done, the flame of a rose-burner has a marked tendency to blow itself out, as any gas will do when fed to a burner under too high pressure. In all other appliances on which the producer gas has been tried, it either works well without change of adjustment, or else the appliance can be adjusted without change in construction. Since the gas is made entirely from oil it need not be purified any further than a mere tar extraction, provided the sulphur-content of the oil is as low as $^1/_{10}$ of 1%. The possibilities of the producer are almost unlimited, as it generates power cheaper than can possibly be done by steam, and the gas gave good results in every field in which it has been tried. A ten-retort size, producing 1700 cu. ft. of gas per hour has a floor area 4 by 5 ft. and a height of 7 feet.

MR. MURPHY ON THE COPPER SITUATION.

"I see be th' pa-ap'rs," said Murphy one day as they were going on shift, "that since th' passage iv th' poor food law, it has bin daysided that th' copper cint piece has bin wrongly la-abl'd."

"How is thot?" asked McCarthy.

"Well, ye see," replied Murphy, "th' Injun sign on a piece iv copper cud be so aisily misunderstood be th' thoughtless an' unha-adeful. Ye know they might jump t' th' conclushun that it was th' proper tra-ade mar-rk iv th' business, an' corrictly ripresinted what was on th' insides iv th' packa-ages they were being handed fr'm ti-me t' ti-me in th' stock exchange. This wud niver do at all ye see, as there niver has bin anny Injun characteristics such as cunning, 'r doopplicity, 'r dayceitfulness, 'r raypacity, 'r croolty, 'r bravery about anny iv th' doings iv th' la-ads who dale th' car-rds in th' copper ga-ame.

"So Rogerfeller, an' Guggenheinze, an' Colerine, an' th' ither la-ads got thegither wan da-ay an' daysided that th' poor food law was plainly being violated, an' th' Injun's head wud have t' come off. They had always fed th' public th' sthraight goods about Ama-algamated an' ither copper stocks, an' they did not want t' be li-ibled be th' Injun's prisince on a copper coin.

"After they had their minds set t' oba-ay th' law, they wud not rest contint with anny halfwa-ay maysures, but daytermined t' carry out th' spirit as well as th' letther iv th' law. They wud adopt wance an' f'r all an emblim f'r th' cint piece that wud prove how good an' pu-ure they ar-re.

"A committy was appinted, an' when it met a gra-ate dayscushun was held. Some were f'r puttin' th' Golden Rule on f'r a motto. Ithers thought 'twud be more appropria-ate t' use th' picture iv its Author. Wan la-ad finally suggested that as they all acknowledged their human origin it wud perhaps be betther to not claim compla-ate fra-adum fr'm human fra-ailties, but confess th' possibility that sometimes they might not be entirely thrue t' thimselves an' dayscind t' th' class iv th' la-ads Lincoln an' Washington."

"It that so?" exclaimed McCarthy.

"Yis," said Murphy, "an' afther further dayscushun 'twas daysided that th' la-ad Lincoln most thruely represinted thim. Ye see th' la-ad Washington was a bit austare in his morals, which ye cud not sa-ay iv th' copper bys; so thay passed th' wor-rd on t' th' Governmint la-ads, an' that's why we have Lincoln's head on th' wan cint piece."

"Ye don't sa-ay so!" was McCarthy's comment.

"I do sa-ay so," replied Murphy, "an' t' show ye how it pa-ays t' be kind-hearted an' honest an' aboveboard in ivery wa-ay, I must tell ye how th' la-ads have raycintly bin rewar-rded.

"Ye know that since th' price iv copper dropped t' th' bottom iv th' well, afther th' la-ad Rogers—who's dead now—used hayroic efforts t' kape it at twinty-foive cints, till th' public cud git th' benefit

iv th' high priee be buying Ama-algamated on the strength iv it, th' la-ads have had th' har-rdest kind iv a time t' git it above thirteen eints again. Some onkind an' onsympathetic reproba-ates who desar-rve t' be choked on virdygrease have had th' ma-aneness an' th' har-rdihood t' sa-ay that th' price was where it belonged. If that was so, what wud become av all th' la-ads who can't produ-nee a pound iv th' rid metal f'r less th'n four-rteen eints. I'd like t' know! Down wid th' thra-at'rs!

"Well, t' show ye how th' good ar-re raywar-rded, some iv th' copper bys—th' A-brham Lincoln kind—got thegither an' daysided that t' give th' four-rteen eint la-ads a chanet t' live an' enjoy thimselves a bit, th' price shud go t' sixteen eints; an' that a mer-rger was th' thing t' put it there."

"What do ye ma-ane be a mer-rger?" asked McCarthy.

"A mer-rger," said Murphy, "is a benevolint insthrumint av Pr-rovidince, rayvealed t' humanity be diriet inspir-rashun in th' minds iv sueh grate an' good men as John D. Rogerfeller, an' Henr-ry Havymore, f'r th' pur-pose iv demonstratin' the gr-rand old truths iv th' law iv Kipling an' Darwin that only th' sthrong shall prosper an' those that ma-ake good sur-rvive. 'Tis a wondherful dayvice f'r ma-akin' this law git a move on itself.

"As I was sa-ayin', though, it was daysided be th' Lincoln eopper league, that a mer-rger was na-aded an' wan shud be formed at wance. No sooner did th' general publie rayilize th' troubles iv th' four-rteen eint bys, though, an' what was proposed f'r thim, thin they rushed t' th' reseue an' began t' buy copper f'r th' purpose iv boostin' it up t' th' sixteen eint mar-rk t' help thim along. I tell ye, McCarthy, th' world is growing betther each day."

"Is Sinitor Clar-rk av Montanya goin' t' hilp thim for-rm th' mer-rger?" asked McCarthy.

" 'Tis har-rd t' say," replied Murphy. "Th' exsinitor be request, goes about with a dra-amy look in his fa-ace, an' ivery wance in a while he pulls a hair fr'm his whisk-rs an 'We'll for-rm it', he says. Afther a bit he pulls anither wan, an' 'We'll for-rm it not', says he. An' so on."

" 'Twill be a tay-jous wa-ait f'r th' other bys, judgin' be his piekchures," said McCarthy, "but why don't they go ahead without 'im?"

"They're afra-aid he'll write a new deelarashun iv independents," replied Murphy.

"What wud it be?" asked McCarthy.

"T' hell wid ye," said Murphy. "Ye see whin a man e'n sell his copper f'r six eints an' ma-ake money at it, th' la-ads that are thryin' t' boost th' price t' fifteen eints wud be in an awkward fix if he said that tin eints a pound was enough f'r annywan, an' backed th' pla-ay."

"I see," said McCarthy.

"But that is nayther here nor there," continued Murphy. "Th' big thing in th' copper business nowadays, is th' low-gra-ade orebody. Ye see th' la-ads in Arizona, Nevaday, an' Utah have bin makin' such a foine demonstrashun iv its value la-ately, that th' people ar-re gittin' hold iv th' idea, an' th' lower th' gra-ade now, th' betther they like it. A man with a tin per eint proposition cuddn't git a look in at a foive eint piece be wa-ay iv promoshun nowadays, but if his ore shud only run wan per eint he'd be smothered in granebacks.

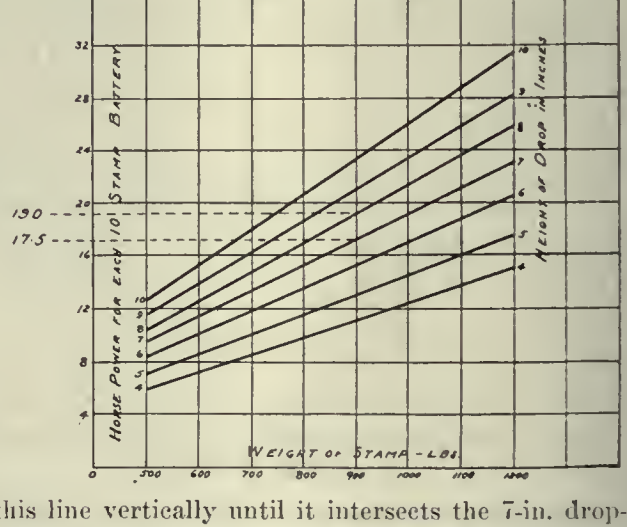
" 'Twill not be long before me frind Channing 'r Mudd 'r Yeatman will be writin' raypoorts an' sa-ayin': 'I have th' honor an' th' pleashure, gintlemin, t' raypoort that ye-er engineer has most carefully examined th' Consolidatd Double Cross mine, an' ricomminds it f'r immajiate purchase. 'Tis a most phenominal orebody. Fr'm th' looks iv it ye'd think there wasn't a pound iv copper within a thonsand miles. 'Tis th' hungriest lookin' rock I iver saw; an' without a parthical iv exaggerashun I e'n sa-ay it is th' lowest gra-ade yet discovered. It is so low I am forced t' th' use iv mathematical an' physical ter-rms t' properly describe it. Fr'm an averige iv all me assa-ays I e'n sa-afely sa-ay that th' ore carries minus thray an' wan half per eint iv metal. In other words, there is a copper vacuum. I e'n sa-ay no more, f'r language fails t' express me emo-oshun. I e'n only urge ye t' raise th' money at wanee an' close th' dale within delay, befure th' chanet is lost. It shud be th' most successful promoshun iv th' a-age."

"Do ye mane all iv thot?" asked McCarthy.

"Well, I dinnaw," said Murphy, " 'tis not so far off. Th' public wud git a betther run f'r its money than it gits par-rt iv th' time now.

POWER REQUIRED FOR STAMPS.

In a recent number of the *Australian Mining and Engineering Review* is a convenient table for calculating the horse-power required per stamp under various conditions. The following example explains the method. Required: the horse-power necessary to drive a 10-stamp battery of 900 lb. stamps, 90 drops per minute, height of drop being 7 in. Take the figure 900 under the 'weight of stamps', follow



this line vertically until it intersects the 7-in. drop-line, then proceed horizontally to the left of the diagram, where it will be found that the required power for each 10-stamp battery is 17.5 hp. Another use of the diagram is in finding the change in horse-power by varying the height of the drop without changing the weight of stamp; for example, with a 900-lb. stamp, in changing the drop from 7 in. to 8, the increase in horse-power for each 10-stamp battery is from 17.5 to 19 horse-power.

SLAG REDUCTION.

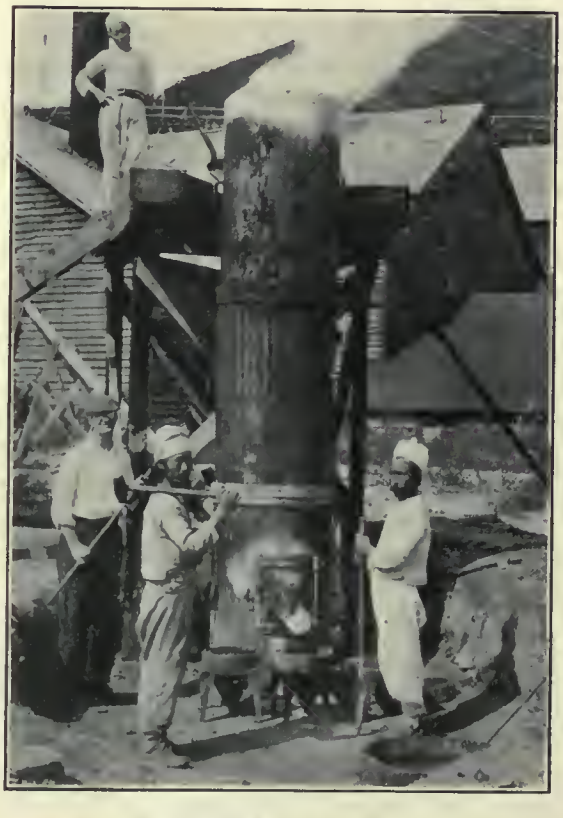
Written for the MINING AND SCIENTIFIC PRESS
By J. D. HUBBARD.

The slags obtained from the reduction of precipitates at the cyanide plant of the Oriental Consolidated Mining Co., Taracol, Korea, amount to from 1600 to 2300 lb. per month, and assay from 0.28 to 0.70c. gold per pound. In the past we shipped these slags to a smelter on the Pacific Coast for reduction, having no facilities for extracting the metals here. The smelter returns were unsatisfactory, and after receiving returns on a shipment that ran 32% lower than the company's assays, we cast about for a method whereby we could keep that 32% at home.

A slag assay is necessarily difficult on account of the 'scale gold', so the smelter cannot altogether be blamed for playing safe. The gold remaining in the slags is not altogether represented by 'shot' gold, as one would naturally suppose, but is held in the iron matte that does not always break clean from the slag when tapping off. Drippings from the crucibles, iron scales from the roasting pan, overflow from the matte treatment, skimmings, etc., represent the balance. If shot gold alone remained in the slags, the reduction would be simple, as re-grinding in the clean-up barrel with quicksilver, followed by cyaniding the tailing, would result in a high extraction. The main objection to this method I think is, that if black lead crucibles are used in melting, a fouling of quicksilver is bound to take place in the barrel; and, if charcoal is used as fuel (as is the case here), a loss in cyaniding will occur in the leaching vat due to the precipitating qualities of charcoal. Both graphite and charcoal are generally to be found in such slags, and the percentage of extraction in this case cannot be reliably determined from a slag tailing assay.

To overcome the troubles here, I employed the blast-furnace principle, and constructed a stack 12 ft. high, in three sections of 4 ft. each. The outside diameter is 30 in., and the inside diameter is 19 in. The distance from the bottom of the brick lining to the top of the stack is 10 ft. Fire bricks 9 by 4¾ by 2½ in. were used, being set lengthwise with the stack, having the width 4¾ in. on the radius. This gave a lining of 5 in. all around the inside of the stack. Clay was used as mortar. The shell of the stack is of ⅛-in. sheet-iron. Lugs were riveted on the sides of the two top sections to facilitate handling. A ⅛-in. sheet-iron door 14 by 18 in., and curved to the contour of the stack, was hinged at the tap. The door is necessary, as, at the end of each heat the residue of the charge must be drawn. The door is opened, two of the bricks are knocked out, and the residue drawn off through the hole thus made. This gives us a clean stack for the next heat.

Two tap-holes are used, the lower one, 1½ in. diam. at the extreme bottom of the brick lining, and the top hole 1¾ in. diam., is 5 in. higher up. I made the mistake of having these tap-holes too small at first, and had to enlarge them to the above dimensions. The slag is tapped off through the upper hole, and the base metal through the lower one. The bottom 2 ft. of the stack was filled with concrete, and on this the bottom bricks were laid. These bricks slope from 6 in. below the draft-hole, to 10 in. at the lower tap-hole. This slope is necessary to make the metal run off thoroughly. The draft-hole 6 in. diam., was first placed at the back of the stack, and directly opposite the tap-holes. In practice this gave poor results, as a back air-current formed, which burned out the lining over a considerable area directly over the draft-hole, not visibly affecting the lining anywhere else. All efforts to shift the feed would not overcome this fault, so I finally had to divide the draft and introduce the air-blast through two 3½-in. holes on the sides, and at right angles to the tap-holes. The air-blast through these side holes was given a slight cant toward the centre of the bottom. This



Slag Furnace at Taracol, Korea.

gave entirely satisfactory results, and caused an even wearing of the inside lining. A No. 2 Sturtevant fan, running 2600 rev. per min., gives just the right amount of draft-pressure at the stack.

After much experimenting I determined the right proportions for the charge. One-half coke, one-half charcoal, and one-eighth slag, by bulk, were mixed, and fed slowly and continuously into the stack. I would prefer to use coke alone were I closer to a source of supply, but here the cost is high. On starting, the stack is heated with coke, and allowed to run half an hour on the air-blast before commencing to charge the mixture. The stack is charged to a height of about 6 ft. from the bottom, leaving 4 ft. open. On account of the tendency of the charge to pack, this is necessary. At intervals a layer of 1 ft. of clean coke is fed to further overcome this packing tendency. Also, at intervals, slag from the assay office (high in lead content) is fed, and sufficient lead is reduced to bring down the precious metals. The assay-slag also contains a good percentage of unsatisfied flux, which helps to liquefy the charge, and to overcome the clogging tendency of the ash formed.

The metals settle quickly to the bottom through the liquid top-slag. The top-slag is tapped off frequently from the top hole, into conical molds, and at longer intervals the metal from the bottom tap-hole. The top-slag is perfectly liquid, and is low in assay value, the assays giving about ½c. per pound. The base metal is later run into bars and a bullion sample is taken. An average bullion-assay on this base metal shows fine gold 34.45, and fine silver 259.51.

The cost of treatment per ton of slag by this process is $32.89, divided as follows:

Coke	$22.50
Charcoal	2.25
Labor	3.40
Power	1.27
Iron, etc.	0.31
Fire brick	1.30
Depreciation	1.86
Total	$32.89

The one item of freight to the Pacific Coast formerly cost $20 per ton.

SELENIUM IN WASHINGTON.

The discovery of a selenium mineral in the gold-quartz ores of the Republic district, Washington State, was announced at a recent meeting of the Geological Society of Washington, by Waldemar Lindgren. The veins, which have yielded several million dollars in gold, are contained in Tertiary andesitic rocks and tuffs. The vein matter is quartz, chalcedony, and opal deposited in concentric crusts. Adularia, in considerable amount, also occurs in the gangue. Ore minerals, and particularly native gold, are rarely visible in the gangue, and the ores have proved difficult to treat. In rich ores slight black streaks indicate the presence of metallic minerals, and in a few places, in the Republic mine, a well defined black or dark gray mineral forms crusts a few millimetres in thickness. This material is exceedingly rich in gold, but contains no free metal. It consists mainly of an antimonial tetrahedrite associated with specks of chalcopyrite. A partial analysis by Mr. Palmer, of the United States Geological Survey, showed no tellurium, but the presence of about 1% of selenium, which in all probability is combined with the gold. This interesting result places the Republic veins in the rare class of Tertiary selenide veins, of which Tonopah is the only known representative in the United States. From descriptions, one of the few deposits of this kind, outside of the United States, is that of Redjang Lebong in Sumatra. No doubt the difficulties which have been experienced in the treatment of these ores are attributable to the presence of selenium compounds. Further metallographic investigations are now in progress to determine the exact character of the selenide.

Deposits of ores of vanadium, one of the rare metals, occur at several places in the western part of the United States, according to a report just issued by the Geological Survey, but none of these were mined in 1908, although 300 tons of vanadium ore was imported into this country from Peru during the year.

CORTEZ ASSOCIATED MINES.

A corporation has recently been organized in Boston which is expected to become so important in the future development of the mineral resources of Mexico as to call for more than casual mention. In fact it starts upon its career with as much promise of a brilliant future as did the ill-fated New England Exploration Co. This is the Cortez Associated Mines, which includes in its personnel many well known Bostonians. The articles of incorporation were taken out in West Virginia, the capitalization being $1,500,000, divided into 500,000 shares of $3 par value. The original operations will be in Hidalgo, Mexico, where the company owns 934 claims, amounting to 2307 acres, said to contain valuable deposits. The officers are: William G. Rice, president; Joseph Story Fay 3rd, vice-president; Philip W. Wrenn, secretary and treasurer; Olof Wenstrom, consulting engineer. The officers, with Chauncy Eldridge, George S. Baldwin, and W. Martin Swift, constitute the board of directors. The company will issue 275,000 shares, of which 175,000 will pay for the property in full, including promotion charges, and 100,000 shares are offered the public at par. The entire issue has been underwritten, and the 175,000 shares will be put in escrow for one year, leaving on the market nothing but the full paid shares. The underwriters' commission is 25 cents per share. In taking stock in payment for the property, the former owners have emphasized their faith in the enterprise, and the cash raised by the company will go into actual mining and equipment. The 225,000 shares remaining unissued in the treasury provide a valuable asset for future financing, if required. It is understood that the company will organize a number of subsidiary corporations, and that its operations will ultimately extend over many States.

The lands are in two groups, lying 4½ miles apart, near the town of Jacala, in the State of Hidalgo, Mexico. Jacala lies north of the famous mining camp of Pachuca. The lands also are not far distant from the other well known camp of Zimapan, and at Flojonales, 15 miles distant, extensive low-grade copper deposits are under development by the Robert S. Towne interests of New York. Jacala lies about midway between the City of Mexico and Tampico, and is on the line of a railway now under actual construction. The company's holdings have been selected personally, after thorough investigation by Olof Wenstrom.

The property includes many antiguas, or old Spanish-Mexican mines, there being several hundred old mines, pits, and tunnels remaining from early operations, and some of the more extensive of these have reached a depth exceeding 600 ft. The veins are in limestone with associated porphyry. Sampling of the available workings in the oxidized zone in connection with actual records of past production has given satisfactory results, showing ores containing gold, silver, copper, and lead in commercial amounts. Much work has been done on an available water-power near Jacala, including surveys, on which engineers have been employed for an extensive period.—Adapted from *Boston News Bureau.*

CONSERVATION AND INLAND WATERWAYS.

By Edward P. North.

*The conservation of natural resources has two possibilities wrapped up therein, one of which is doubtful as to benefits; the other is irredeemably bad. I refer to the intended increase in the already large number of Government appointees. With a growing tendency to have our Presidents selected by a group of high financiers whose interest in their adopted or native country is subsidiary to possibilities of immediate gain, the interests of the country make it imperative that the Executive should not have his influence and power over the legislative branch increased. The power of appointing and furthering the interests of a large body of civil servants must inevitably have a strong reflex, if not direct, influence on the acts of legislators who wish aid from their constituents, thus increasing the Executive power to an extent dangerous to the form of government under which we have lived for over a century.

The ostensible reasons for the movement for the Conservation of Natural Resources is that, first, large bodies of wooded land may be created at the headwaters of streams to increase the rainfall and retard the run-off or stream-flow in times of heavy rain. For over 30 years a comparison of rain-gauge records has increasingly shown that the rainfall is not so great over large areas of wooded land as on cleared land, though there are claims that small areas do increase the rainfall to some extent. It is also well known that in times of prolonged drought the ground is dry to a greater depth in forests than in either plowed land or meadows, and dry ground cannot, of course, afford much water to streams. It is further maintained that deforestation has increased both the frequency and amplitude of floods and the duration and intensity of low waters. Careful comparison of statistics does not prove this claim. At the Tenth International Congress on Navigation, Milan, 1905, 'The Influence of Deforestation, etc., on the Performance of the Rivers' was one of the questions discussed. This was reported on by eight European engineers, who left the matter undecided in the minds of those educated to the popular beliefs. Last fall this subject was brought before the American Society of Civil Engineers by a paper, 'Forests and Reservoirs in their Relation to Stream Flow', by Lieut-Col. H. M. Chittenden, U. S. Engineers. This paper was discussed by 23 engineers, foresters, and professors, leaving considerable latitude for the entertainment of previous or subsequent beliefs on the subject. On both occasions it was seen that engineers directing works for improving rivers were nearly unanimous in their doubts as to the advantages to accrue for either forests or reservoirs.

The second aim of the conservationists is to prevent water-powers falling into the hands of monopolists. This seems an attempt to play on the dissatisfied poor. Its success will tie up the development of sparsely populated regions, and by keeping the producers and consumers of both agricultural and manufactured products as widely separated as possible, will render the products of either of less value to the other. The aim of the protagonists of this plan seems to prevent the prompt development of water-powers and the industries dependent upon their employment. Each horse-power of utilized power is understood generally to add one person to the population of the locality where it is used. The success of their plans would confine manufacturing to its present limits and methods. Neither capital nor free labor will go into work or enterprises not promising a living wage or remunerative return, and the purpose to have the general Government exact all the rent that production can bear, combined with the plan of short leases, will probably confine the extension of manufacturing to already well financed localities. In the meantime the water runs unused to the sea. Coal, which it is wished to conserve, is used at a greater cost, while the water-power is wasted and the laboring population is being increasingly congested.

Since the Dingley law was passed, which it was plainly seen would increase our wealth, a vigorous propaganda has been waged against aggregated capital. Our trade rivals know that production can be cheapened either by reducing wages or by increasing the capital employed, whether in power, machinery, or transportation. The first method is unthinkable here, but as segregated capital is powerless for large production the attack has been directed against large accumulations of capital, whether of cash or credits, which are necessary to cheapen production. Two years ago the attack was tolerably successful. When the Steel Corporation took the rail contract for the Sultan's railroad through Arabia away from Fraülein Krupp by underbidding her, the wheat growers of Minnesota, Iowa, and States adjacent, were told by their leaders that a great injustice was done them by underselling the American market. They knew perfectly that not a pound of freight for those rails was transported, nor a single rail made, except by men who ate, as an average, over 300 lb. of American-grown wheat, while they did not say that the average German per capita consumption of American wheat was about 10 lb. While the stand-patters will assert it was the tariff, and others will say it was the aggregation of capital, no one dare deny that for every week during 1906 and 1907, quotations for rails were higher at the mill-doors in England than at the mill-doors in this country, reaching in August 1907, £6 17s. 6d., or $5.54 above the American price: and if our consumers had paid the prices the British had to pay, our rails for 1906-07 would have cost us over 25 million dollars more than they did. Few can say that poorly financed and disorganized companies would not have kept the price of rails up to the British standard. If we had made no rails, or even had been unable to supply our demand, the $100 per ton to which Mr. Carnegie testified would have gone to foreign rail makers.

Possibly none of our assets has added more to the national wealth than low freight-rates, and any saving in the cost of transportation is net wealth to the community in which such saving is effected. For 30 years we have enjoyed the lowest freight-rates in the world. Our trade rivals have made American railroad finance the object of unremitting attack. In this they have been aided by personal differences with

*Abstract from the *Editorial Review*, New York.

railroad servants in addition to all the venal influence purchasable, but as the capitalization of our railroads has been increased, the cost of their services to the public has been decreased. The most valuable service of railroads is the transportation of freight. This is measured by the equivalent of the number of tons carried one mile (called ton-miles) and the cost per ton-mile. The relations between population, railroad capital (that is, stock, bonds, and unsecured debts), ton-miles, and cost of freightage, for the two years 1882 and 1907, is shown below, notice being called to the fact that 1882 was the first year for which all these items were attainable, and was before the era of consolidating competing roads into 'systems':

	1882.	1907.
Miles railroad	114,677	236,949
Capital	$6,640,493,397	$16,670,802,244
Ton-miles	39,203,209,249	233,137,507,807
Rate, cents	1.2	0.782
Ton-miles per capita	748	2717
Population	52,495,000	85,817,000

It will be seen that while our population increased 63½% and our mileage a little more than doubled, capital increased more than 2½ times, the ton-mileage nearly 6 times, and the cost per ton-mile was less than two-thirds of what it was in 1882. The difference between the actual cost in 1907 and what would have been the cost for the same service at the rate received in 1882 amounts to $11.35 per capita, or, to the estimated population of 1907, an aggregate of $974,000,000, being over 1% of our estimated wealth for 1900.

This rather large sum increased the profits of every producer and decreased the cost to every consumer of commodities carried by our railroads. The railroads undoubtedly received a reflex benefit through the larger consumption and higher standard of living which the saving in freight charges allowed. This is shown by the increased passenger traffic. In 1882 the average citizen traveled 130 miles, and paid 2.86c. per mile. In 1907 he traveled 328 miles, and paid 2.04c. per mile. Third-class railway fare in Great Britain is 1d., or 2.03c. per mile.

It is of interest to note in connection with the fact that from 1890 to 1905 the capital necessary to put a man at work manufacturing, increased from $1385 to $2065, and in farming the sum necessary increased during this period from $2110 to $2756; the economies rendered possible by the large accessions to railroad capital above mentioned have reduced the capital employed to move one ton one mile from 17.54c. in 1882 to 7.15c. in 1907. This allows the same service to the public for about 40% of the capital. If the railroads had to struggle for a capital per unit of service equal to that employed in 1882, it is a fair inference that both farmers and manufacturers would have been seriously hampered in procuring the capital necessary for increasing and cheapening their products.

The plan of the conservationists also includes preventing the monopoly of farm and coal lands, the term monopoly being understood to refer to any large holding. Both of these objects are meritorious, but withholding large areas from settlement seems an oblique way of accomplishing the first object, and experience shows that the small holder of coal land is much more apt to rob his mine than a railroad owner, which takes out all the coal on which it can make a profit either by mining or by carriage to market.

Conservation of natural resources had its genesis in the demand for a capacious and economical waterway from the Great Lakes to the Gulf. It may have been thought that the universal demand of the Central West for such increase of their wealth as would be contributed by cheaper transportation could be made to help other schemes, or that the other schemes would hinder the acquisition of Central Western wealth. Mr. Roosevelt, it will be recalled, endorsed the deep-water project with conscientious enthusiasm in 1906. In 1907 he appointed an Inland Waterways Commission, which made its preliminary report in 1908. From the simplicity and directness of this report the entire conservation policy has been developed. Why the President appointed as chairman of this Commission a Congressman who was understood to have prevented an appropriation for a survey for this deep-water project, a Congressman against whose course resolutions are said to have been introduced in the Legislatures of both Missouri and Illinois, may never be known. Whatever the animus of the appointment may have been, it has issued in delay, and will result, as far as the influence of the chairman goes, in a recommendation for such inadequate and restrictive depths as will effectually prevent an accession of wealth to the country, either from improvements of the Mississippi, or an enlarged and continuous Atlantic Coast waterway. President Taft is talking of a 9-ft. navigable channel along our coast, when even the Dismal Swamp Canal has 10 ft. This 9-ft. proposition for the Atlantic Coast-wise canal is particularly atrocious, as aside from its commercial value, a canal of warship capacity along the coast would prevent the blockading of any port unless by a fleet superior to all the ships in the home fleet. With it, American exports would go unhampered to the sea except from one, or, at the most, two, of our Atlantic ports, under any combination against us, and the necessity for warships would be reduced.

The principal beneficence of water transportation, in sufficiently capacious channels, is to allow the production and consumption of commodities of such small value as are not able to pay railroad freights, instead of extending aid in cases of spasmodic congestion. Railroads share in the benefits at each end. This is shown generally by the fact that railroads serving capacious waterways serve also the largest populations, and carry the most high-classed freight per mile.

Foreign interests will try to prevent a commercially valuable coast-wise canal or any deepening of Western streams of economic value. But the size of locks prescribed by the Illinois Legislature will prevent expenditures to keep Lake-built vessels from access to the sea, where they would carry our products directly to a market. It is my conviction that the aims of the Inland Waterways Commission, as set out in Senate Document No. 325, are hostile to the labor and prosperity of the country, and their plans should not be endorsed.

Discussion.

Readers of the MINING AND SCIENTIFIC PRESS are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy. The Editor welcomes the expression of views contrary to his own, believing that careful criticism is more valuable than casual compliment. Insertion of any contribution is determined by its probable interest to the readers of this journal.

Oriental Trade and American Shipping.

The Editor:

Sir—In your issue of September 25 appeared a communication from Edward P. North which concludes in this fashion: "What sort of a chance has an American * * * manufacturer of exploiting * * *" the Orient. "Until someone opens a downright fight every corrupt influence in the American Government will give preference to foreign shippers and shipowners." The idea lying back of such a statement as this is so ridiculous, and so at variance with the facts of the case, that I cannot forbear replying, but have delayed doing so until I could collate from my own experience the records of concrete cases as illustrations.

As I take it, the idea of this writer, and, presumably, of a considerable portion of the American public (for I have often seen similar expressions in print) is that the foreign trade of American manufacturers would flourish were it not for a stupid and even criminal policy of the Government, which prevents it. Leaving out of the discussion any question as to what possible advantage it could be to either the Government or any of its employees to do this, I propose to point out that the causes which tend to prevent the growth of American trade in the Orient lie at the door of the manufacturer himself; and I make this, not as an empty assertion, but as the result of experience in placing orders both in America and Europe for a wide variety of goods.

The first reason why American trade with the Orient does not flourish better is that American firms do not make any real effort to secure orders from the Orient. Most of the larger firms have a perfunctory agency with some English or German firm which is engaged in a general export and import business. If you visit one of these firms you will probably find that they have not even any advertising literature of these American goods. Almost certainly you will not find any samples. Now the Oriental is an adept in misrepresentation himself, and thinks himself far too wise a bird to be deceived by a glittering picture into buying something that will not be as represented. Certainly you will not find anyone at the agency who knows anything about the product in question, but they will have some British or German samples to show you which they 'can assure you will be entirely satisfactory', and it is politely intimated that it would be rather unwise for you to invest in some doubtful American product when you have these others here before you and can see what they are like. The other day I was talking with the representative of a British firm which has the agency for the Lima Locomotive & Machine Co. He said that he had sold several of their locomotives to a new railway here, because the engineers of the road (Chinese educated in America) had insisted on getting them. He said he did not know much about the locomotives, and added that he thought American locomotives generally inferior to the British makes. I have not yet written to the Lima Locomotive company to congratulate them on their effective agents in the East, but I hope they will read this. The same man also mentioned that he is the agent for Fraser & Chalmers, and when I said that I should naturally prefer to deal with their American house, he expressed great surprise that they had any American connections, and ventured the remark that they must be quite unimportant.

Even supposing that some enterprising buyer learns of an American product that appeals to him, hunts up the agency, resolutely refuses to take any British or German brand and insists on having his order placed for it. Does the manufacturer promptly and accurately fill the order, and does it arrive in good condition, quite to the satisfaction of the purchaser, who then sends further orders? Unfortunately, no. Of a series of orders placed in America, only one, with a San Francisco firm, met these conditions. The trouble with most of the others was apparently a lack of ordinary intelligence on the part of the manufacturers. One firm was ordered to send a large number of small packages by registered mail. Although situated in the interior of the country, this firm packed them all in one box, sent them by freight to New York, and thence by tramp steamer by way of Suez. They arrived so many months late that arrangements had been made to get along without them, and the shipment was refused on delivery. Another firm was ordered to send some small articles by parcels post. This firm took the packages to the Post Office, not in Podunk, but in New York, mind you, and the Post Office refused to take them, on the ground that Tientsin is not a coast port. As ocean-going steamers land at our Bund, it would be interesting to know what a coast port is according to the Post Office. This firm had no recourse but to ship by express, a most unsatisfactory way, as it entails the maximum of cost and the minimum of speed. The goods have not yet arrived, eight weeks from the time of shipment. Goods were ordered of another firm in one of the Rocky Mountain States. No notice of shipment was sent, and after waiting as long as possible, about $100 was spent in cable tolls, trying to find out whether shipment had been made or not. The goods were five weeks traveling 1000 miles to San Francisco by rail, and the freight charges for this distance were just equal to what they were for the 6500-mile remaining ocean-haul.

Not less annoying to the purchaser are the little stupidities that crop up. Firms which have been instructed to draw on us at the time of shipment will send a bill instead, and continue to send monthly bills (with a two-cent stamp on the letter), quite regardless of the obvious fact that it would take three months to get a reply to their first bill. Then, several weeks after we have sent them a draft, we will get a notice from our bank that they have at last drawn on us for the amount of the bill. Not a few send letters soliciting our trade, with a two-cent stamp on the letter. Of course, as soon as we have paid the double postage, we hasten to order.

Another point is that the American goods are not so well packed. I could mention cases of this, but I pass on with the general remark that American goods are neither so well nor so carefully packed as the German and British, in most instances. Another well known fact is that the American usually pays comparatively little attention to the appearance of his goods. The Oriental likes red lacquer and gold paint on his purchases. He is lucky if he gets any paint at all on his American purchases, and if there is it will probably be battered and scarred.

In the face of all this it is remarkable that there is any American trade here at all. That there is any is due, I think, to the fact that the actual 'usability' of American goods is generally much greater than the foreign article. A newspaper received today says that President Schurman has returned from a trip to Europe with the announcement that American goods cannot compete in quality with the foreign. The good Doctor must have confined his attention to dry goods and 'wet goods', or else he is a poor business man. Everybody knows that wines and many varieties of cloth are made better abroad because climatic or other conditions give the foreign countries an advantage. But with every kind of goods with which I am familiar I can specifically deny Dr. Schurman's assertion. In almost every case the quality of the material in the American article is equally good and the workmanship (but not the finish) is superior. Far superior are the American designs. The American article is generally much better adapted to the work it is intended to perform than is its foreign competitor, but I must qualify this by adding that the American manufacturer makes absolutely no effort to find out what modifications of the home designs the foreigner wants. In this matter the Germans are zealous. Contrast also the methods of the British and Germans. They have their own agencies, manned with representatives who are familiar with the objects they are supposed to sell. Most Americans seem ignorant of the European idea that people engaged in wholesale trade are entitled to move in good society, while those in the retail business are tradesmen, and are not to be noticed. It is a fact, nevertheless, so that the representatives of European firms are generally intelligent gentlemen. The few American firms that send representatives send mannerless young cubs, or roisterous drummers who frequently earn speedy contempt from Europeans and Orientals alike. Finding themselves looked down upon, they begin to brag of things American, and so become still more disliked. The Oriental is a stickler for good form, and the first requisite for a representative in the Orient should be tact and good manners—not 'American push'. Finally, the Germans fill an order with painstaking accuracy, and the British do nearly as well. You can get an order from here to Germany in 12 to 14 days and be confident that the goods will come forward exactly as ordered. If you send one to America you have four to six months in which to wonder what new form of stupidity the shippers will perpetrate, before you get your goods. But this is, of course, the fault of our wicked and corrupt Government!

Where the manufacturer does so little to recommend himself it is not remarkable that our diplomatic representatives in the Orient do not do more. The British and German ministers are keen in backing up firms of their own nationality in their efforts to get trade, but the American representatives get the cold shoulder at the American legation. Neither is there any American commercial attaché, although every European country, even Sweden, has one. It would undoubtedly be easy to secure the appointment of one if American manufacturers should manifest any serious desire to increase their trade with China. I may be pardoned for taking up so much space, but I could not suffer the blame to be laid on the wrong shoulders, while the real source of the difficulty goes unnoticed. All loyal Americans would certainly rejoice to see an increase in American trade with the Orient, but with equal certainty it is not likely to grow unless more intelligent effort is directed toward securing it.

THOMAS T. READ.

Tientsin, China, December 9.

Metallurgical Progress in Colorado.

The Editor:

Sir—The attention of this company has been called to an article by Philip H. Argall in your issue of January 1, 1910, in which (on page 40) he makes an uncalled for and unmerited attack on the operations of our smelter at Modern, near Denver, Colorado. The article is so obviously unfair, that if it is not due to lack of exact knowledge, we might be justified in suspecting that Mr. Argall held a brief for one of the most powerful interests in this State, which considers it greatly to its advantage that our smelter should go down as a failure and that the miners of Leadville, Gilpin, and Clear Creek should become more securely fastened in its clutches—interests which, in the past, have used every means at their command to strangle all other smelting enterprises.

The ore buying of our company is not confined to Gilpin county. Half of our ore supply comes from Leadville, Redcliff, and the Salida districts, and our railroad connections are the same as those of the Globe plant of the American Smelting & Refining Co. We are treating sulphide ores, carrying gold, silver, and copper, at lower prices than can be done by any other plant in this State, and this is the reason for our existence. Other plants, which have to roast and run slags low in silica, are unable to get sufficient ores to keep them busy, while we can treat these low-grade, deep-level pyritic ores at a small profit to ourselves and to the miner. By our methods of charging, our metallurgist has absolute control of his charge, and our metallurgical results compare favorably with the best practice anywhere. We use 4% less coke, and make slags 8% higher in silica than any plant now operating in Colorado. We have made slags for days carrying only a trace of gold, 0.25 oz. silver, and 0.05% copper from charges which contained 0.5% copper. The freeze-ups which occurred during the first ten days of our operations were due entirely to minor mechanical defects which have been entirely overcome, and no freeze-up has happened since October 15. The matte-

which is very high in grade, is not sold, as stated by Mr. Argall, to the American Smelting & Refining Co., but is sold directly to the refinery of the United States Metals Co. of Chrome, New Jersey. We do not regard ourselves as in any way competing with other smelting companies, as we are in the market for ores which are not desirable to other Colorado smelters and which have been accepted by them in the past as an unavoidable evil and which they were compelled to treat as a by-product for their customers who were producing desirable ores. The Bimetallic at Leadville, under Mr. Nutting, was a success as a pyritic smelter, and the failures at Golden, Florence, and Kokomo, were due to special, local, or personal reasons, well understood by the metallurgists and mining men of Colorado.

THE MODERN SMELTING & REFINING COMPANY.

Cyanidation of Manganese Silver Ores.

The Editor:

Sir—Referring to your reprint of my paper on the 'Cyanidation of Manganese Silver Ores' in your issue of December 4, 1909, I wish to add that a mere list of the constituents of an ore has very little bearing on its amenability to cyaniding. For instance, manganese dioxide can be added to a silver ore without having any effect on the results of cyanidation. Some manganese ores are amenable and some are not, according to whether the silver is intimately associated with the manganese or not. In the instances mentioned in my article it was not possible to isolate the manganese mineral which gave the trouble, as it was so finely disseminated; consequently the manner of association can only be conjectural.

From the facts elicited from my experiments it would seem as if this were a case of definite manganese-silver mineral, though I have never come across any mention of such a mineral in the text-books. The subject offers an interesting study to anyone having the leisure and appliances for research work, and few mines are equipped for detail research work.

Lluvia de Oro, Mexico, January 3.

Graphite—An Obstacle to Good Cyaniding.

The Editor:

Sir—Regarding 'Graphite—An Obstacle to Good Cyaniding', by M. W. von Bernewitz, in your issue of December 4, there is no doubt in my mind that graphite does interfere with the extraction of gold from refractory ores. In treating slags and crucibles (crushed in a ball-mill with cyanide) I have had no trouble. As far as my experience goes, graphite ores are 'refractory', and there seems to me to be some connection between the graphite and the refractory effect. For instance, in the Ashanti Goldfields the current tailing when treated with 15% KCy solution gave a poor extraction, while accumulated tailing, after preliminary washing and alkaline treatment, gave good extraction. In both cases graphite was present in sufficient quantity to form a scum on the surface. This graphitic ore of the Ashanti Goldfields, which contains a greater percentage of graphite than does the Kalgoorlie ore, and like the latter occurs in schistose rocks, is now treated by dry crushing, roasting, and cyaniding, an extraction of over 90% being obtained.

The ore is put through a revolving dryer and crushed through a 25-mesh screen in No. 5 Krupp ball-mills. From them it is conveyed to an Edwards duplex furnace, and then to cooling bins by means of a push conveyor. The roasted ore is leveled and cooled, and dampened with water in these cooling bins, and is then trucked to cyanide tanks, where it is treated with 0.25% KCy solution.

There is no separation of sand from slime. Sintering is prevented by the careful manipulation of the air-inlets close to the end fire-grate, where is the greatest heat. If the ore should chance to form lumps, the complete removal of the air-inlets will soon cause the lumps to disappear. The test for a good roast is to take a little of the discharge; let it cool; put it in a glass beaker; add clear water, and if no graphite particles float on the top, the roast is good. The roasted discharge should be tested every half hour. This can be done by the fireman.

I do not agree with Mr. von Bernewitz that "the trouble can only be minimized by carefully excluding such ore from being sent to the mills." The plant at Ashanti Goldfields, Gold Coast Colony, has been treating graphitic ore (containing more graphite than the Kalgoorlie ore) successfully for the past three years, obtaining an extraction of over 90 per cent.

DONALD F. FOSTER.

Belmont, Sutton, England, December 21.

Regenerating Copper Cyanide Solution.

The Editor:

Sir—I read with interest R. P. Wheelock's tests on the regeneration of copper cyanide solution, and I beg to say that I have made thousands of tests relative to the same, years ago. I had my method protected by patent, a part of which is controlled by a company. In fact two patents were taken out. My experiments were practically all made with potassium cyanide, and not with sodium cyanide. I claim that it is commercially feasible, although the books contradict it. In handling a cyanide solution if one cannot readily save the precious metals on zinc shaving, he can save the gold, silver, and copper with sulphuric acid, and will get the same results day after day if the acid is not used in excess, as Mr. Wheelock evidently did when the gas raised his precipitate to the surface, and caused hydrocyanic acid gas to escape. The solution should be agitated a second time after standing 15 to 20 minutes. Also a saturated solution will precipitate quicker than a weak one, and readily restore 80% or more of the potassium or sodium cyanide, as the case may be, at a cost of not to exceed 10c. per pound. The solution should be thoroughly saturated with copper, when that salt is present, before making the precipitation. The clear solution should be decanted, and the precipitate washed into the filter, before adding the second cyanide solution to be precipitated.

ISAAC ANDERSON.

Prescott, Arizona, December 20.

Concentrates.

Most of these are in reply to questions received by mail. Our readers are invited to ask questions and give information dealing with the practice of mining, milling, and smelting.

A miner's inch of water is usually sufficient for each battery of five stamps, including concentrators and cyanide plant.

Delay alone, no matter how long continued, cannot impair an inventor's right to a patent, unless by reason of it, another becomes the first to give the invention to the world.

Zinc ore, under the new Mexican freight rates, may be shipped from Chihuahua to Tampico for $4.60 per ton and to El Paso for $2.97. The former rates were $4.60 and $1.89, respectively.

Churn-drill exploration on a mining claim, performed for the discovery or estimation of quantity and character of ore deposits, or for the benefit of a deposit held under a valid location, is accepted as annual assessment work.

Gold is not usually bought by the ton, but such an amount, Troy weight, is worth $496,123.20, or by avoirdupois, $602,921.93. The standard American price is $20.67 an ounce. In Japan a trifle more has been paid.

To find the diameter of pump plungers to pump a given quantity of water at 100-ft. piston speed per minute, divide the number of gallons by 4, then extract the square root and the result will be the diameter, in inches, of the plungers. This is for single double-acting pumps; for duplex double-acting pumps, divide by 8 before extracting the square root.

Mining claims in Mexico, called *pertenencias*, are subject to an annual tax of ₱6, or $3 gold, each. A *pertenencia* is a square bounded by sides 100 metres long, that is, it is an area of one hectare, which is equal to 2.47 acres. The above named tax is assessed upon each *pertenencia* or fraction thereof, and is payable in three annual installments due in March, July, and November.

Glass models may be marked with a ruling pen, according to E. D. North, who further suggests that the outlines of the levels should be in the same color as that used for filling. For the latter purpose he uses Winsor & Newton oil colors mixed with turpentine and japan. The latter two are mixed half and half and kept in stock and stirred in with each color as needed. It requires about 24 hours for the colors to dry on the glass.

Concrete may now be delivered on the work through pipe-lines by means of compressed air. The device used consists of an iron tank with an air-tight gate at the top and a conical bottom with outlet to the pipe system. The concrete is mixed and dropped into the tank, the gate closed, and air under 50-lb. pressure admitted through a side inlet. It forces the concrete through the pipe to the delivery point, where a nozzle consisting of a plank box with curved top, diverts it, thoroughly mixed, into forms or upon the work. A 4-in. pipe is sufficiently large, and the concrete will pass right-angled turns or even a 180° bend with a 4-ft. radius. The concrete may contain rocks up to 2 in. diam. in a 1-3-5 mixture. Air at 100 lb. pressure has been tried, but even at 50 lb. the delivery is too rapid for practical work without the nozzle described.

Hammers for hand drilling commonly weigh 4½ lb. For double-hand work, 10-lb. hammers are used. The striking face must be flat or slightly rounded, and smaller than the stock of the hammer. The hole is started on solid or squared surface with a short drill, for the longer the drill the less effective the blow. Light blows are struck first. The bit is turned one-eighth of a revolution after each blow, to insure keeping the hole circular.

Concentration occurs under ideal conditions on canvas-tables, or buddles, when the velocity of the current is uniform and is such that its carrying power is a mean between that which would move the grains average maximum density and that necessary to hold in suspension the grains of gangue. This velocity being maintained, concentration will vary with the degree of classification or sizing of the pulp and the character of the surface on which the concentrate is held by friction.

Vanadium salts are said to be favorable to the growth of plants; vanadyl phosphate acts physiologically like potassium permanganate; from vanadates and tannic acid a waterproof black ink is made; vanadium salts are used in coloring glass; metavanadic acid has been used as a substitute for gold bronze in paint; vanadium chloride is used as a mordant in printing fabrics, and the trioxide as a mordant in dyeing. Vanadium compounds are used for several purposes in chemistry.

Blocking up a column-bar for drilling should be done in stages when the bar stands on broken rock. The attempt to jack the bar up the whole amount at one time is apt to result merely in splitting the blocking. Pieces of tough wood reasonably free from knots should be used. Sawed wedges about 1 ft. long and of varying thickness at the butt are to be preferred, but blocks that are flat on the side next to the rock and rounded on the side next to the bar may be used. Most of the blocking should be placed at the jacking end of the bar if possible; a 2-in. piece properly wedged will serve at the other end, which in a vertical set-up is the upper end of the bar.

Dust-arresters of hanging wire are used, according to the friction system, at the Great Falls, Montana, smelter. There are 1,215,000 wires weighing, altogether, 608 tons. It was determined experimentally that these wires gave nearly as high recovery as baffle plates with much less frictional resistance to the passage of gases. From the entrance for 150 ft. the chamber is fully occupied by wires hanging from alternate intersections of 1⅝-in. mesh steel-wire netting, bolted to the roof. Beyond this is 50 ft. free from wire, then another 150 ft. filled as before. In the floor of the dust-chamber are more than 1000 sheet-steel hoppers arranged for drawing the dust into cars which convey it to reverberatory furnaces.

Special Correspondence.

NEW YORK.

Copper Merger Plans.—New Directors of Utah Copper.— Lewisohns Take the Wettlaufer-Lorrain Silver Mines, Limited.

The past two days has seen no little progress made toward the copper merger. The outline of a preliminary combination which is to include the Amalgamated Copper Co. and the Cole-Ryan properties is announced. The first step is to be an increase in the capital stock of the Anaconda company to $150,000,000. The merging of all of the important properties is to be made through purchase by the Anaconda, which will take in at present the Boston & Montana, Butte & Boston, Parrot, Butte Coalition, North Butte, and the smelters controlled by the Amalgamated. In the announcement just made setting forth the plans, one of the reasons given for the step taken is the avoidance in the future of costly and troublesome apex litigation. The meeting of the stockholders to ratify the proposed increase of capital stock, is to be held in Anaconda, Montana, March 23. Presumably, later this company will also absorb the Cole-Ryan properties lying outside of Butte, the Giroux at Ely, the Greene-Cananea in Sonora, Mexico, and possibly the Calumet & Arizona, though it is rumored that Mr. Cole is now entirely out of the latter property.

It is not, however, in regard to Butte properties alone that copper merger affairs have been making progress. The New Jersey court has dissolved the temporary injunction forbidding the combination of Boston Consolidated and Utah Copper, and today the board of directors of the Utah Copper Co. was increased by the addition of seven new members, the following gentlemen being elected: Daniel Guggenheim, Murray Guggenheim, S. R. Guggenheim, F. A. Schirmer, Ernst Thalmann, of Ladenburg, Thalmann & Co., Eugene Meyer, Jr., and T. W. Lamont, vice-president of the First National Bank of New York. The company also filed its amended certificate with the Secretary of State of New Jersey, certifying to an increase in its capital stock from $7,500,000 to $25,000,000. Stockholders are to have the right to subscribe for one share of the new stock at $50 for each ten shares held. While there is no obstacle now to prevent the consolidation of Boston Con. and Utah Copper, the original plan of taking Nevada Consolidated in, remains in abeyance because of the attitude of James Phillips and the stockholders who stand with him. The Utah Copper Co., has, however, today notified the secretary of the Nevada Con. that a part of the increased capital stock of the Utah Copper Co. will be held in reserve to comply with an agreement made with certain shareholders, whereby the Utah Copper Co. offers to give one share of its stock for 2¼ shares of Nevada Con. The Utah Copper Co. will hold this offer open up to and including March 5, and any Nevada Con. shareholder making the exchange is also to receive subscription rights. The attitude of Mr. Phillips is unchanged, and it is evident that Nevada Con. is not to go into the combination without a bitter fight. The purchase by Phelps, Dodge & Co. of the Arizona Copper Co. is reported, but denied. While the various steps detailed seem to pave the way for the larger company which was to be formed to dominate the copper industry, a good deal of doubt is expressed in the East as to when the new flotation will be brought out or whether it will be made at all. One prominent authority discussing the matter, said to me that he thought the copper merger would, for the present at least, resolve itself into the formation of several large groupings and a 'gentlemen's agreement'. This view of the matter is due to the political situation. The fact that so many of the large combinations are either under fire or being investigated and that an attack may be made upon them, does not tend to create an atmosphere in which it would be wise to offer to the public a new industrial trust. From the present attitude of the administration it might be very safely anticipated that the new trust would be branded as an outlaw before fairly going.

A controlling interest in the Wettlaufer-Lorrain Silver Mines, Ltd., has been purchased by the Silver Mines Exploration Co. The latter is the proprietary company through which Adolph Lewisohn and his associates carry on their operations in Canada, and through which their great success has been made in Kerr Lake. The Wettlaufer has a shaft down 152 ft. It has been a small producer and shipper for some time and is considered the best developing mine in the South Lorrain district. The company has $100,000 in its treasury, as well as 125,000 shares of stock in reserve.

LONDON.

West African Mines.—Ashanti Goldfields.—Cinnamon Bippo. — The Sulphide Corporation Recovers.

The gold mines of West Africa are now attracting increased attention. The discoveries during 1909 were interesting, and the introduction of new capital and improved methods by two of the leading South African houses has had an important influence on the history of this field. The time is therefore opportune to give some details about some of the leading mines. I will take as examples the Ashanti Goldfields and the Cinnamon Bippo.

The Ashanti Goldfields Corporation, Ltd., was started fourteen years ago by Frederick Gordon, who was a pioneer in the founding of modern hotels in London and elsewhere. One of his chief financial backers was J. B. Maple, the great furniture man of Tottenham Court Road. In its earlier days the company had varied fortunes. In 1908 a discovery at Justice's not only added to the company's assets, but directed attention once more to the possibilities of the ore deposits in West Africa. A year ago the known deposits at the Ashanti mine were such that W. R. Feldtmann, the consulting engineer, considered the deposit to be low grade and recommended that it be worked on a large scale. Additional plant was therefore erected. During this past year a remarkable change has come over the mine, especially in the orebody under the old Obuasi workings. Here great bodies of high-grade ore 8 ft. wide and exceeding 3 oz. per ton are being developed, and the whole complexion of the undertaking has changed. The extended extraction plant will not now be used on low-grade ores, but it will be available for the treatment of the high-grade ore on a large scale. The company's report for the year ended June 30 shows that 70,345 tons of ore yielded 41,014 oz. gold valued at £174,368, with a gross profit of £85,260. After royalties of £8718, London expenses £5101, debenture interest £5412, and allowing £13,893 for depreciation and £9154 for mine development redemption, a net profit of £44,792 was made. Mr. Feldtmann's report shows that during the year November 1908 to October 1909, 79,010 tons yielded gold to the value of £201,287. With regard to the metallurgical processes, the most important item is that amalgamation was entirely abandoned in September. This method of extraction was never a success, even when the oxidized ores were being treated. In the lower levels sulphur and arsenic came in, and also graphite, so that the extraction became still worse, and some other method of extraction had to be sought. Dry-crushing in ball-mills, Edwards furnaces, and leaching by cyanide was adopted, and the first part of the plant was erected early in 1907. This was doubled in 1908, and at the present time an entirely new plant to supersede these is being erected. By this method an extraction of 90% is obtained. At Justice's the metallurgical problem is different, for the ore is soft and contains clay instead of consisting of quartz. The method of treatment is to crush in the stamp-mill, using a cyanide solution, and subsequently separate the sand from the slime, the latter predominating. The sand is treated by percolation and the slime is treated by agitation and filter-pressing. The sulphide ore at Justice's requires much longer roasting than the quartz sulphides, and the best treatment will be investigated when the completion of the new plant releases the old one and leaves it free for experiments and investigations. This will happen next June. The ore reserves at the end of October totalled 519,300 tons averaging 18.2 dwt. Of this, 88,000 tons were in the Obuasi shoot and averaged 47 dwt. per ton.

The Cinnamon Bippo Co., Ltd., owns property two miles

long in the northern part of the Tarkwa banket reef, and the control has lately been taken over by the Consolidated Gold Fields of South Africa. The operations conducted recently have consisted entirely of development work. The deposit has been proved to be of rather lower grade than the other parts of the Tarkwa deposits, but on the other hand the content is more regular. Over the whole property the outcrop is found to be auriferous. Walter Broadbridge, who was recently appointed manager, estimates that the ore so far developed contains 213,000 tons, running from 5.2 to 9.8 dwt. per ton, and averaging 8 dwt. The consulting engineer, H. H. Webb, considers that ore containing less than 6 dwt. could not be profitably worked, and has revised the estimate to 133,000 tons averaging 9.3 dwt., and 80,000 tons of unpayable ore averaging 5½ dwt. Trouble has been experienced from the inflow of water, and extra pumps have been provided. Mr. Broadbridge has advised that a new main incline shaft will be required. The question as to the size of the mill is still in abeyance. Henry Hay has been appointed as a joint manager with Mr. Broadbridge of all the properties in West Africa under the control of the Consolidated Gold Fields.

The recovery of the Sulphide Corporation has been one of the features of the past year. Floated in 1895 by the Exploration company, of London, and Gibbs, Bright & Co., of Melbourne, to work the Central mine at Broken Hill and treat the ores by the Ashcroft process, the company has had a chequered existence, and full justice has never been done to the fine body of ore, which is equal to anything in the district. The Ashcroft process was not a success and soon fell out of use. The dressing plant has during the last two years been entirely re-built, and the plant for treating the zinc tailing by the Minerals Separation process has been greatly improved recently. The consequence is that the company is now able to pay a dividend on its ordinary shares. The capital is £962,500, divided into 550,000 preference shares of £1 each and the same number of ordinary shares of 15s. each. There are also £79,600 of 5% debentures. The preference shares are entitled to a non-cumulative dividend of 10%, and after 10% has been paid on the ordinary shares, both classes of shares rank equally for any further distribution during each year. The dividends paid so far have been: for 1898-9, 10% on both classes of shares; for 1899-1900, 15% on both; for 1900-1, 5%; 1902-3, 5%; 1903-4, 7½%; 1904-5, 10%; 1905-6, 10%; 1906-7, 10%, and 1907-8, 10%; and 10% on the preference alone. For the year July 1, 1908, to June 30, 1909, both classed received 10%, it being the first time for nine years that the ordinary shares have participated in the profits. The year gave a profit of £153,382, out of which £96,250 has been distributed as dividend. The amount of ore treated during the year was 195,332 tons, from which were obtained 42,354 tons of lead concentrate in the jigs and 67,981 tons of zinc concentrate in the flotation plant. The lead concentrate assayed 60% lead, 9.9 zinc, and 32.3 oz. silver, and the zinc concentrate 42.5% zinc, 11.4 lead, and 16.6 oz. silver. In addition, 40,684 tons of old zinc tailing was treated, producing 14,464 tons of concentrate. The slime plant was re-started on June 14, and up to the end of that month 2179 tons were treated, yielding 1109 tons of zinc-lead concentrate assaying 32.5% zinc, 21.4 lead, and 28.2 oz. silver; this awaits further treatment, and no doubt if Horwood's new roasting process is a success it will be applied for this purpose. Of the lead concentrate, about one-half was smelted at the company's smelter at Cockle Creek and the remainder sold locally. The smelter also treated about 60,000 tons of purchased ores. Practically the whole of the zinc concentrate was sold. It was found impossible to distill the zinc concentrate on the spot, and the zinc smelting plant was closed in December 1908. The company controls the Central Zinc Co., which recently erected a distilling plant near Hartlepool, England. This is not yet in working order. The development of the mine at the 1100-ft. level disclosed unexpected ore at some distance from the main orebody. The total reserves are 2,803,920 tons, which is a figure slightly greater than when the company started operations 13 years ago, but it is not expected that the reserves will be maintained in the immediate future.

KINGMAN, ARIZONA.

Mines Active.—Details of Mills.—Needles Smelter to Resume.

The Arizona Gold Mines Co., controlled by A. and H. E. Denio and E. M. Lamont, has 100 acres of mineral ground situated 3½ miles southwest from Kingman, in a formation of granite-porphyry, with intrusions of diorite. This includes one principal diorite dike, over 2000 ft. in length, from which there are deflecting branches. An area 510 by 750 ft. has been tested and explored within the last two years, and, according to data obtained at the property, the granite-porphyry and diorite are both gold bearing, though the richer ore is that obtained close to the contact of the two. The tests made in 100-ton lots with a 10-stamp mill on the ground are said to have shown an average recovery of $4.92 per ton by plate amalgamation. The battery screens are 14-mesh; the pulp, after passing over one section of plates, is re-ground in a Huntington mill having 80-mesh screens, then passed over a second section of plates, thence over a Pierce amalgamator. This saving is claimed to run from 86 to 92% of the assay value of the ore. The mill has been operated about a year on ore quarried from the surface to an average depth of 20 ft. The prospected area above specified will have an average depth of 40 ft., measured from the surface to the present trackage level. The ore to this depth, or lower, carries some hematite, all oxidized. The gold is disseminated through the gangue, partly in coarse and partly in fine particles. In sinking a shaft not far from the open-cut work sulphide ore was obtained at a depth of 100 ft., but even in this the gold is said to be mostly free and amenable to amalgamation. The 10-stamp mill was built for prospecting and testing purposes, the site being on the main line of the Santa Fe railroad. Mr. Lamont, who is manager, states that results justify the construction of a 40-stamp mill, and various machinery houses are now bidding on the required equipment in accordance with plans already made. The new mill is to be erected close to the old one, and it is anticipated that it will be ready to operate before July 1. The plan contemplates stamp crushing, plate amalgamation, re-grinding in Huntingtons, followed by plates and Pierce amalgamators. A crusher will be installed to reduce the ore to a better size for the batteries, the crushed ore to be conveyed to the mill-bins by a bucket elevator. Water for mill work is obtained from wells, 1600 to 3000 ft. away, and is pumped into a large tank near the mill-site by electrically driven Deming pumps. The mill machinery and air-compressor are steam driven, fuel-oil being used under the boilers at a cost of $1.885 per barrel at the property. In the last year's operations it is stated that the cost of mining and milling has been $1.30 per ton. One 2¼-in. Sullivan drill has been sufficient in mining 35 tons per day.

The Golconda mine, owned by the Union Basin Mining Co., is in Cerbat district, four miles from Mineral station on the Kingman-Chloride railroad. The principal stockholder is John Boyle, Jr., who is also manager. The property was opened less than two years ago, and a body of ore was found that ran high in zinc, together with some gold and silver. Shipments of this ore to a plant of the American Metal Co., in Oklahoma, during 1909 aggregated 7000 tons, and averaged 47% zinc. The gross value of the ore was $25 per ton, about 5 to 6% of this being from gold and silver. Shipments are now running 35 tons per day. In connection with this about two tons of milling grade are being accumulated for every ton that is shipped. On the payroll are the names of 110 men.

The Gold Road Mining & Exploration Co., J. L. Phillips superintendent, with Daniel Bosqui in charge of the mill, is mining and milling 230 tons per day of $10 ore, at a cost of $4.50 per ton. The orebody is 4 to 16 ft. wide, in an andesite formation, the ore consisting of a gold-bearing quartz, accompanied by some calcite. The gold occurs in free particles, but of exceeding fineness. The ore is hoisted by a double-drum electric hoist, Denver Engineering Works make; and Leyner drills are used in the stopes. The air-compressor, having the capacity of 1800 cu. ft. of free air per minute, is driven by a 200-kw. Westinghouse motor. Water for mill and domestic uses is obtained from a well

five miles from the camp, and is forced by electric pumps through a pipe-line to tanks at Gold Road. Electric power for all purposes in this camp is derived from the Kingman power-plant, the transmission line, 28 miles long, carrying 40,000 volts, and this is transformed to 440 volts for mill and mine power. The mill has 40 stamps, 1050 lb. each, dropping 100 per minute, crushing the ore in cyanide solution, through 16-mesh screens. The pulp passes from them to classifiers; the overflow goes to settlers and the underflow to tube-mills, of which there are two. The tube-mill sand that runs below 120-mesh passes to percolating sand-vats; that which is finer than 120 goes to Butters filters. The slime product is sent to collector vats, thence to Pachuca tanks, each 17 ft. diam. by 45 ft. deep. Of the 230 tons of ore crushed per day, 180 tons are treated as slime and 50 tons as sand. In separating the coarse sand from the slime, as these come from the tube-mill, a Dorr classifier is used. The Butters filters, of 120 frames, are in a steel tank 45 ft. long by 11 ft. wide. In these filters 180 tons of slime are treated in 15 hours. The solution, slime, and vacuum pumps, all installed in one room, are operated by two 40-hp. electric motors. The precipitation is by means of zinc-dust in the gold solution, the precipitates being collected in a 30-frame filter-press. Mr. Bosqui states that the consumption of cyanide in these milling operations amounts to 0.4 lb. cyanide to one ton of ore; also ½ lb. zinc and 5 lb. lime to the ton of ore. It is understood that the final tailing assays 20c. per ton. It may be noted that the two tube-mills, of Allis-Chalmers make, have a special iron lining, in sections, devised by F. L. Bosqui and Edgar Collins, and which is to be made by the Allis-Chalmers company.

The Tom Reed Gold Mines Co. has 14 claims two miles southwest from the Gold Road camp, covering a lode which parallels that of the Gold Road mine, the two being less

Tom Reed Mine.

than a mile apart. The Tom Reed lode strikes northwest through a chlorite-andesite country. It has a width of 5 to 20 ft., the gangue being a gold-bearing quartz, partly free-milling, and the rest well adapted to cyanidation. The mine is opened by a 350-ft. incline shaft, sunk in the foot-wall. The lateral development on the vein, including two main levels, amounts to 2400 ft. The mine equipment consists of a steam-hoist, Norwalk air-compressor, Ingersoll-Rand drills for driving, and Shaw drills for stoping. About 37 tons per day are being hoisted and run through the old 10-stamp mill that has been in operation two years. In this experience 40 to 60% of the gold content was recovered on the amalgamating plates, the pulp being afterward cyanided. A new mill, however, has just been completed which will be in operation February 1. It has 10 stamps and combines amalgamation with the all-slime process of cyanidation. Clear water is to be used in the batteries, and the screens are 30-mesh. The pulp passes from the plates to classifiers, the oversize from the latter to a tube-mill. The undersize from the classifier unites with the tube-mill product and both go to another set of classifiers. The resulting oversize and undersize are carried to different sets of settling cones, the underflow from the finer settlers passing to an Oliver revolving filter; then the dewatered pulp is mixed with cyanide solution and passed to Pachuca agitating tanks, and this is followed by filtration in a 48-frame Bulters filter. It is intended to operate the new mill to the limit of its crushing capacity and at the same time cyanide some of the old mill tailing. The mill machinery, which was erected by the Young Construction Co., of Los Angeles, is to be operated by electric power. According to results obtained by operating the old mill the ore of the Tom Reed runs $20 to $30 per ton. S. S. Jones, the company's manager, is assisted in the metallurgical work by B. L. Lunceford. Charles Grimes, president of the company, is a Pasadena man. John Hays Hammond is the owner of a considerable amount of the stock.

The Needles Mining & Smelting Co., a subsidiary of the United States Smelting, Refining & Mining Co., whose plant at Needles, California, has one lead and one copper furnace, is putting the equipment in condition to begin operations in a few weeks; and within the next three or four months a new lead furnace will be installed, and a 100-ton concentrating plant is to be erected to prepare certain classes of low-grade ore for smelting. This mill is to have facilities for separating the zinc from other minerals, the zinc concentrate to be shipped to zinc plants East. The additions and improvements planned will bring the smelting plant up to a capacity of 400 tons of charge per day. This company has a number of groups of mining properties, partly developed, at Chloride and Stockton Hill, Mohave county, including the Tennessee, Banner, and Champion, on each of which a small force of miners have been put to work. L. D. Godshall, general manager for the company, anticipates getting sufficient lead and copper ores from the company's mines and from custom mines to keep all the furnaces in blast as soon as the plant is ready.

The Carter mine, in the Gold Road district, is opened by a 250-ft. shaft. At the 150-ft. station a cross-cut was driven to the ore, consisting of gold quartz, assaying $25 per ton. The Carter is entirely in control of Mohave county people. R. E. Zuver has done 900 ft. of lateral driving and some sinking on the Navy group of claims through which the old Hardy vein runs, in Silver Creek section.

O. B. Amsden and associates are doing systematic development on the Gold Bug mine, in River range, west of the White hills. The work includes a 500-ft. shaft; on the 300-ft. level is a body of free-milling gold ore of good grade. This is 60 miles northwest from Kingman. The Frisco Mines & Power Co., for which E. H. Barton is manager, is developing a gold mine at Union Pass. Extensive work, with power equipment, is contemplated. The Enterprise mine is developed by about 4000 ft. of work, opening a vein carrying lead, silver, and gold, with some copper. This vein is between diorite and porphyry. The property is in Malapai mountains, 18 miles east from Kingman. W. A. Mensch is manager. The Kingman-Chloride railroad will soon change from tri-weekly to daily trains, and the chloride end of the track is being extended up to the Tennessee mine.

BRITISH COLUMBIA.

Slocan District.—Output.—Zinc Mining.—Winter Development.

The tonnage of ore obtained from mines in the Slocan district during 1909 was approximately 90,000 tons, of which fully 60,000 tons was put through concentrating mills. This statement of output does not include the production of the Blue Bell mine, which, being situated on the east side of Kootenay lake, is not usually regarded as a Slocan district mine. The output from the Blue Bell was nearly 60,000 tons, which was concentrated into about 5000 tons of lead-silver concentrate, besides a zinc-iron product which was not marketed. The chief producers were the Van Roi, Whitewater, and Whitewater Deep mines, each having a production of approximately 28,000 tons. Other fairly large producers were the Selkirk Mining Co.'s Cork mine, 15,000 tons; Lucky Jim, in excess of 5000 tons; Richmond-Eureka, 3300 tons; Standard, 3000 tons; Ruth-Hope group, ore to an amount not ascertained but which yielded 1850 tons of concentrate in the proportion of two-thirds silver-lead and one-third zinc, and the Rambler-Cariboo, which shipped 680 tons of crude silver-lead ore and 350 tons of concentrate. Shipments, ranging in quantity from less than a carload up to 770 tons, were made from some 30 other properties, including those situated in Ainsworth mining division, which is being included in this notice of the Slocan district.

The year 1910 opens with a distinctly promising outlook. Long deep-level adits have been driven on three properties,

with results on two that have induced the owners to continue operating the mines, while on the third arrangements are being made to raise to old workings above so as to connect the 2000-ft. adit with known ore-bearing ground. In Whitewater camp the chief work in progress is on the several mines known, respectively, as the Whitewater, Whitewater Deep, and the low-level workings of the Deep Mines, Ltd., all of which are being operated under the management of John L. Retallack. Some 50 or 60 men are employed in mines and concentrating mill, and the properties are in better condition for regularly maintaining ore-production than for several years past.

The Lucky Jim is the largest zinc mine in British Columbia. No ore-production is being made at the present time owing to the refusal of the railway company to accept it for transportation during the winter months when frost and snow make its handling difficult. Pending a resumption of production, another adit is being driven to give about 250 ft. more stoping ground. A concentrating mill is planned to bring production up to a total of 1500 tons of zinc ore and concentrate per month. The quantity of milling ore now available is estimated at 60,000 tons, containing from 8 to 10% lead, 25 to 30% zinc, and 10 oz. silver per ton. The Rambler-Cariboo is in better condition at present than at any previous time for a year or more past. Ore has been found down to the tenth level, and several productive shoots of ore have been opened in different parts of the mine, so that the normal production of approximately 100 tons of silver-lead ore per month can easily be regularly maintained. At the Rio, which is situated just above the Rambler-Cariboo, levels are being driven to get under ore-shoots known to occur above, and it is expected production will be practicable next summer. In the neighborhood of Sandon the Payne, Slocan Star, Richmond-Eureka, Hope-Ruth, Surprise, Sunset, and Noble Five, are the chief properties now being worked. Ore has been found in several parts of the Payne mine, which years ago paid dividends to a total of $1,363,000. The diamond-drill has been used in prospecting by the Sandon Mines, Ltd., which plans to resume the operation of the Payne concentrating mill next spring. Meanwhile ore-shoots are being opened, some 25,000 tons of ore having been blocked out ready for stoping. On the Slocan Star group the winter's operations are being restricted chiefly to driving two tunnels to the extension of the big shoot of ore that for some time past has been productive on the neighboring Richmond-Eureka ground. It has been estimated that fully $500,000 worth of silver-lead ore will be found in this part of the Slocan Star ground. The litigation over extralateral rights which led to a cessation of operations in the old Slocan Star workings, on the opposite side of the gulch, having been finally settled, it is intended to resume mining and milling. The Richmond-Eureka and the adjoining Summit claim, which are being worked conjointly by the Consolidated Mining & Smelting Co. of Canada, Ltd., is being developed, the intention being to increase ore-production substantially in the spring. Ore from these properties is conveyed to the Canadian Pacific railway at Sandon, and taken thence by rail and barge to the company's smelter at Trail, to which, by the way, practically all silver-lead ore and concentrate produced in the Slocan district is shipped for reduction.

About Cody, near Sandon, mining operations are in progress on the Reco, Surprise, Sunset, and Noble Five, all neighboring properties. The long adit driven by the owners of the Surprise is 1100 ft. vertically below the surface and the vein cut by it is as strong and well mineralized as it was a thousand feet above. Some clean galena has been found and further exploration is under way to develop this shoot of good ore. The Sunset, which several years ago was a regular dividend payer to the syndicate owning it, is being developed at greater depth by a cross-cut adit to cut the ore-shoot below where it was productive nearer the surface. The Noble Five had been idle for six or seven years, but it is being worked now and may be expected to ship ore next season. In the vicinity of Slocan lake eight or ten properties are being worked. Near New Denver the Mollie Hughes is producing ore in which native silver occurs freely. Mining is being done on two levels, drifts being run both ways from cross-cut adits which cut the vein. At the Standard mine, above Four-mile creek, drifts on No. 4, 5, and 6 levels are being extended. In one of these there is a fine showing of ore, about 14 ft. in width, much of it clean shipping ore running high in both silver and lead. Gray copper occurs freely in the galena, and contains considerable silver. Work is also being done on the Emily Edith, situated immediately below the Standard and owned by the same men. On the other side of Four-mile creek, also in what is known as Silverton camp, the Van Roi Mining Co. is opening several levels, some from the east side of the mountain and some from the west. Two veins are known to occur on this property, but only one is being worked at present. The ore is milled at the Wakefield mill, on Four-mile creek, and from 140 to 160 tons per day are sent down by aerial tramway to the mill. This company is preparing to erect its own concentrating mill, as the owners of the Wakefield mill will require to use it next summer for ores concentrating from the Lorna Doone and Hewitt group, which are being developed by the Silverton Mines, Ltd. Some large shoots of ore are being blocked out in these latter mines and more will be developed as the three adits now being driven shall pass under the ore-shoots already opened. Ruby silver and gray copper occur freely in the ore which, so far as developed, is a distinctly dry ore, though more lead may be found when greater depth shall have been reached. The same company is also prospecting the Hamilton, on Twelve-mile creek, and has already found pockets of high-grade ore in the workings. The Ellis Silver Mining Co. is further developing the Eastmont, in the vicinity of Ten-mile creek.

JOHANNESBURG, TRANSVAAL.

Gold Output.—Technical Education. — Ferreira Deep.—Gold Fields' Reports.—Stope-Drill Competition.—Rotary Extractor.

With the declaration of the gold output for November, a statement of production for the year can be estimated with confidence of useful accuracy. At the same time there will doubtless be many gold reserve adjustments made in the December declaration, tending to abnormal figures. It will probably be found that more gold has been taken from, than added to the reserve this year. From present data it appears that the value of the year's yield for the Transvaal will barely exceed $150,000,000, won from a mill tonnage of 21,300,000 tons. The working profits have averaged $5,000,000 per month. The number of stamps at work has risen from 9464 at the beginning of the year to about 9700 at the close, and the stamp duty from 6.5 tons per head per full 24 hours to 6.9 tons. There are 150 tube-mills at work in December, as compared with 120 in January 1909 and 72 in January 1908.

The rapid strides made in the provision of facilities for the acquisition of technical knowledge by workers along the 'Reef' reflect great credit upon the staff of the Transvaal University College. As a residential university for graduating students, it will be a long time before this institution can bear comparison with the American, English, or Canadian colleges. To justify its expense it must popularize itself. Evening classes have attracted a most gratifying attendance during the last year or two. The zeal shown by students, coming into town at the end of a hard day's work, was so far appreciated last year that a course of lectures on mining was delivered at various points in the East and West Rand by Prof. Yates to meet the requirements of distant workers. The principle thereby established has now been commendably extended by Prof. J. A. Wilkinson, who has started a vacation course of lectures in chemistry and physics at suitable centres in the East Rand (10 to 15 miles from Johannesburg). To suit the convenience of men engaged in the various shifts, morning lectures are duplicated in the evening. They are followed by classwork and examination. A nominal fee of $5 is charged for 12 lectures. In this excellent scheme, the college is receiving keen support from the mines.

The Ferreira Deep is one of the most prosperous deep-level mines on the Rand, though it should be added 'barring accidents', for there has lately been a serious crush at the

foot of its No. 2 vertical shaft, resulting in a temporary reduction of the tonnage mined. During the year ended September 30, 1909, the Ferreira Deep milled 418,057 tons for a yield of £948,577 and a profit of £609,878. Working costs totaled 16s. 2.4d. per ton milled. Underground costs, being representative, are of general interest. They stand: stoping, 4s. 1.5d.; shoveling and tramming, 1s. 3.5d.; pumping, hoisting, etc., 3s. 0.9d.; and development, 1s. 1.7d. per ton mined.

It is sometimes alleged that the Consolidated Gold Fields of South Africa are unwisely reticent in their reports, and that they would gain more support if they took shareholders into their confidence. There may be justice in this criticism upon occasion, but it cannot be said that details are always ignored. The firm controls among its divers interests the Carolina Asbestos Co., which almost represents the Transvaal asbestos industry, and is far from prosperous. During the last financial year, 207 tons of asbestos was recovered, and a loss of £630 recorded. One looks in the annual report for some information as to the extent of asbestos-rock explored or developed. Even the record of operations and results is meagre and vague. But we are told that "in the early part of the year a native hospital costing £10 ($50) was erected." Who can now declare that the Consolidated Gold Fields are secretive with any base motive, when we find them thus deliberately exposing the weakness of gross extravagance!

It is time that the country be given detailed informa-

Drill in Rand Stope.

tion regarding the results of the stope-drill competition to date. It has now been proceeding for several months, and although we hear a good deal through unofficial sources, we are told nothing of value. The figures occasionally published—without authority, it would seem—throw no light on the position, except by way of showing which machines still survive the tests. It is at least certain that only five drills are still competing, namely, the Siskol, Holman 2⅛ in., Chersen, Holman 2¾ in., and New Century, placed in the order of merit which, I suggest without prejudice, will be that eventually determined by the judges.

A paper is promised by two cyanide men of the East Rand Proprietary Mines (Messrs. Lloyd and Rand) upon a new type of rotary for use with the zinc precipitation process. Experiments have been proceeding for some time and are reported to have produced satisfactory results. There are three or four compartments used, in which are slowly revolving rotors carrying the zinc. As full details are to be published shortly, it is only necessary here to indicate the lines on which experiments have been undertaken. If some method, allowing a speedier and less 'messy' clean-up than that seen in ordinary practice can be cheaply devised, and one doing away with the trouble of the white precipitate at the head of the boxes, it will soon gain popularity. Precipitation methods on the Rand are certainly receiving critical attention, especially as there are now advocates of zinc-dust precipitation, wishing to test its applicability with these solutions.

MEXICO.

Big Transaction at Santa Eulalia. — Real del Monte. — Guanajuato Production.—Zacatecas Revival —El Oro District.

Following on the heels of the Santa Gertrúdis deal is a report that the American Smelting & Refining Co. stands ready to purchase the mines of the Chihuahua Mining Co. and the Potosí Mining Co. in the Santa Eulalia district of Chihuahua for $8,000,000, or ₱7,000,000 in excess of the Santa Gertrúdis purchase price. The two companies are American, and the principal stockholders are Grant B. Schley, of New York, and Dennis Sullivan, of Denver. The Potosí mines rank among the greatest silver-lead producers in the world, and are among the most important zinc producers of Mexico. The mines of the Chihuahua company also rank high in silver-lead production. It is said that the negotiations will be terminated, one way or the other, before April 1. Two properties in the Santa Eulalia district, the San Gregorio and the Esmeralda Anexas, have just been purchased by the Exploration Co., Ltd., of London, represented by R. M. Raymond. They adjoin mines owned by the American Smelting & Refining Co. The Exploration Co., Ltd., has still pending an option to buy the properties of the Reforma Mining & Milling Co. in the State of Guerrero for ₱20,000,000. If this deal is made it will set a new mark for Mexican mine transfers.

The largest dividend in the history of the Cia. Real del Monte y Pachuca, ₱200 per share, was declared in January. This amounted to approximately ₱600,000. As is well known, the Mexican company is controlled absolutely by the United States Smelting, Refining & Mining Co. of Boston, and the dividends paid to date have about equalled the purchase price of the properties, which was ₱4,401,000. Possession was secured by the purchase of practically all the stock of the company at the rate of ₱1500 per share, and the deal has proved one of the biggest bargains in Mexican mining history. The holdings comprise a total of 72 mines, and the majority of them have not yet been touched by the present owners. Two cyanide plants are in operation, handling from 600 to 700 tons per day, and a third plant is now planned. C. W. Van Law recently succeeded E. P. Merrill as general manager of the properties.

According to statistics given out from week to week on shipments of ores, concentrates, and bullion from the Guanajuato district, the total production in 1909 was ₱14,188,100. The low price of silver had no effect on milling in the Guanajuato district, the big mills continuing to operate steadily during the year. A recent report by Finance Minister Limantour, covering the fiscal year 1908-9, shows that the production of silver in the 12 months, 2,191,199 kilograms, was the greatest in the history of Mexico. However, due to the decrease in the price of the white metal, the value of ₱77,109,742 was about ₱8,000,000 less than that of the preceding fiscal year, when the output was not as large. It is estimated that the silver production of the calendar year 1909 exceeded that of the fiscal year.

The old Zacatecas district, which has a record of immense production since its opening in 1546, appears to be on the eve of a mining and milling revival. The most important plant will be that of the Zacatecas Mining & Metallurgical Co., a concern recently launched by M. E. MacDonald, of Guanajuato, to work the San Cristóbal and Zacatecas groups of mines in the gold-belt. Mr. MacDonald is widely known as one of the men prominently identified with the mining and milling revival in the Guanajuato district, and as the man who engineered the deal that gave the United States Smelting, Refining & Mining Co. possession of the Real del Monte. A milling plant now at the San Cristóbal mines, consisting of 30 stamps, Frue vanners, and amalgamating plates, will be overhauled, and a cyanide annex of 150 tons capacity will be installed. It is planned to devote two-thirds of the capacity of the plant to custom ores. The Veta Grande Metallurgical Co., organized in Mexico City, has purchased the old Refúgio plant, and will remodel it for modern concentration and cyanidation of custom ores. The capacity will be 60 tons per day. The San Luis del Oro Mining Co., owning the San Luis del Oro properties in the gold belt, has been reorganized, and with the resumption of milling

will do some custom work. A 50-ton custom plant, erected just north of Zacatecas by a company of which the State Government has a fifth part, will be soon in commission.

While figures are not yet compiete, it is known that the 1909 production of the four big producers of the El Oro district—Dos Estrellas, El Oro Mining & Railway, Esperanza, and the Mexico Mines of El Oro—did not fall for below ₱20,000,000. Statistics for 11 months of the calendar year give a total production of ₱18,185,802, and total profits of ₱8,029,620. The Dos Estrellas was by far the most important producer of the four.

GOLDFIELD, NEVADA.

Consolidated Dividends.—Poleverde.—Black Butte.— Yellow Tiger.

In the Clermont workings of the Consolidated Mines Co. the vein has been penetrated on the 1000-ft. level. The formation at this depth is pronounced by the management to be identical with that shown 100 ft. nearer the surface, and another week's work should determine the character of the vein in the deepest workings of the district. On the 750-ft. level it is said that the vein exceeds in size anything taken into account at the time the last annual report was compiled. Stoping is now in progress at the 750 and 900-ft. levels. No interruption in operations was caused by the recent fire which destroyed the carpenter and machine shops, invoiving a loss of less than $10,000, and the January output of these mines wiii be greater than for any prior month. On January 31 the Consolidated company paid dividend No. 6, consisting of the reguiar quarterly distribution of 30c. per share together with an extra payment of 20c. Accompanying the dividend checks the following statement of receipts and disbursements covering the last quarter of 1909 was mailed to stockholders: Cash balance, October 1, 1909, $1,897,086.84. Receipts—October, $693,-867.40; November, $606,674.64; December, $899,356.34; total, $2,199,898.38. Disbursements—October, $158,035.72; November, $197,790.05; December, $263,554.57; total, $619,380.34. Net receipts—October, $535,831.68; November, $408,884.59; December, $635,801.77; total, $1,580,518.04. Less dividend No. 5, paid October 30, 1909, $1,067,594.10. Cash balance December 31, 1909, $2,410,010.78.

This indicates that after the payment of the regular and special dividends the company's balance on hand January 31 was not less than $1,500,000. Official returns show the output for December to have been over $160,000 in excess of estimates, and the year's production was greater by this amount than indicated by figures published a month ago. During December development consisted of 4390 ft. The new manager, J. R. Finlay, announces in his report for the month that the mili has been demonstrated to have a daily capacity of fully 850 tons and that the increase in capacity has been accomplished without any loss in the metallurgical efficiency of the plant.

An advance has been made in the average of mili-heads by the Florence Goldfield to between $25 and $30 per ton, and the management claims a saving of the gold content of the ore equal to that being effected by the Consolidated. Ore reserves have been increased materially during the past few months and company officials claim a sufficient tonnage in sight to occupy the 40 stamps for over a year. The recent discovery of ore at a depth of 770 ft. in the Annex shaft on the Poleverde claim has been supplemented by cutting a paraliel vein whiie sinking, the two veins being close together and carrying about 4 ft. of ore of shipping grade, the average being around $50 per ton. The shaft has passed the 800-ft. level and has entered the latite. There is a strong flow of water in the shaft. A large station is being cut at the 800-ft. level. From the trend of the vein, nearly east and west, it is thought to be independent of the Clermont or other known veins of this immediate neighborhood. The lower vein carries less copper than that above. Assays from 2 ft. of ore in the first vein cut returned 23% copper, $40 gold, and 15 oz. silver. The double-compartment shaft will be continued to at least the 1000-ft. level, near which depth it has been expected to cut the Clermont vein on its dip to the east. The Grizzly Bear shaft on the Jumbo is down 900 ft. and will be sunk to cut the Mohawk vein near the 1000-ft. level, as indicated by the dip above. Three shifts are working with machine drills. From the Diamondfield Black Butte, lessees have been shipping rich ore taken from a winze at the end of a 75-ft. adit driven into the butte. The vein is 36 in. wide in the winze and the ore occurs in a contact between porphyry and quartzite. Assays have varied from $40 to $400 per ton, the first shipment of 10 tons returning $200 per ton from the mili and but little sorting has been done. The reorganization of the company is now in progress, and after April 1, when assessments on the stock will be due, the officiais of the company expect to have sufficient funds to begin active development and later will build a mill. L. L. Patrick, who is at the head of the concern, is having surveys made and prospecting the old workings. Lessees on the Daisy are saving some good ore for shipment and small production continues from the Goldfield Belmont. Small quantities of high-grade ore have also been shipped from the Gold Coin claim of the Jumbo Extension Co. near Diamondfield.

The reorganization of the Yellow Tiger company, with John F. Campion, of Colorado, at its head, wiii shortly result in the resumption of extensive work from the 750-ft. shaft sunk by the Elks Consolidated lease. The lessee company has opened over $100,000 on the ciaims and has now set aside a fund of $50,000 for further work to be carried on below the 600-ft. level.

AUSTIN, TEXAS.

State Mining Laws.—Difficulties in the Way of Prospectors.

Another effort wiii be made at the next session of the legislature to secure the enactment of a new mining law. The fact that several miilion acres of public domain of Texas are in what is known as the mineral-bearing territory creates a need for a law that wiii cause a systematic exploitation. The present mining law is looked upon by prospectors as a barrier for the reason that it imposes burdens that no one cares to assume. Since the law went into effect several years ago all prospecting upon State lands ceased. At the last session of the legislature a new miuing law was passed. It was drawn to meet the views of men who are interested in the mineral development of the public lands and at the same time to afford ample protection to the State's rights. The Governor held one of the provisions of the bill to be unconstitutional and he vetoed it for that reason. It was too iate in the session to secure a re-enactment of the bill with the objectionable provision eliminated. Under the existiug law no minerals, as such, can be bought from the State, but the land may be purchased under its official classification of the State Land Office as 'mineral-bearing iand'. The procedure to acquire a claim is this: The claimant files with the county surveyor of the county where the land is situated, an affidavit stating that he has gone upon the land for the purpose of buying it for its minerals. This affidavit is sent to the State Land Office, and the land is not subject to be sold to any one else until the lapse of one year. During that time the locator has the right to prospect the land and buy it if he so concludes. When he applies to buy it he has to pay whatever price the State Land Commissioner may fix upon it, the minimum price being fixed by the law at $25 per acre. The acreage of one claim cannot exceed 21 acres. The purchaser is allowed to pay one-fifth cash and one-fifth annually thereafter until the entire price is paid when a patent is issued. While a prospector may make a good showing of ore upon his claim during the year that he is allowed to work it before buying, there is nothing in the law to hinder the Commissioner from placing a prohibitory price upon the land at the expiration of that period.

In the Terlingua quicksilver district, in the southern part of Brewster county, there is much activity in mining on private lands, while upon adjacent sections of land that are owned by the State no prospecting or development is going forward. This is also true of the region where the Shafter silver mine is situated. It is well known to mining men that much of the public domain is rich in minerals, but no one cares to carry on any work of expioitation under the present mining law.

General Mining News.

ARIZONA.

COCHISE COUNTY.

At the Bisbee Sonora Mining Co.'s property, near Paradise, the company has opened the ore by two upper adits and has now started a lower one that will give 600 ft. of backs. The work at present is being done by hand, but it is the intention of the company to build a concentrator and power-plant as soon as the lower adit cuts the ore.——At the Morrow & Chamberlain group, in the Paradise district, the shaft is down 160 ft., and drifts are started on ore that contains a good percentage of copper with some gold and silver. Money has been raised for further work on the group and a hoist and power-plant will be installed this spring.

GILA COUNTY.

(Special Correspondence).—The adit from Keystone gulch, being driven to tap the orebody opened by the lateral work from the Joe Bush shaft of the Inspiration Copper Co., is in over 50 ft. Pending the installation of the 185-hp. air-compressor, double-hand drilling is being done. The adit is driven northeast and will be over 2000 ft. long. At the Scorpion shaft, a cross-cut at the 275-ft. level has been driven south 130 ft., opening the ore cut by the shaft which assays about 3% copper. Thomas Tighe is superintendent and T. R. Drummond manager.——The No. 4 shaft of the Miami Copper Co. is now nearly 500 ft. deep. From it one of the two main haulage ways is being enlarged so electric motors can be used for hauling the ore from the mine. The depth of the present main level is 420 ft. Exploratory drifts are being driven from the main part of the mine, the longest one running southwest toward the Captain claim, where the churn-drills have recently opened a sulphide orebody about 200 ft. thick. Over 40,000 ft. of underground work has been done at this property since January, 1907.

Globe, January 28.

GRAHAM COUNTY.

Arrangements have been made by the New England & Clifton Copper Co. to raise funds to carry on further development and settle its present obligations. A small amount of ore will be shipped to the smelters for converter lining, but the main efforts of the company will be directed to blocking out a large tonnage. Harry Armstrong is manager.——A break-down of the drill on the Celtic group caused a delay of a few days in the prospecting. Operations have been resumed and the drill has cut copper ore at a depth of 180 feet.

MOHAVE COUNTY.

The power-plant at the Tennessee mine, in the Chloride district, has been started and the mine is being unwatered. There are approximately 20,000 tons of ore on the dumps that assay $4.50 gold with 16% zinc which will be shipped to the Needles smelter as soon as the spur which the engineers of the Santa Fe are surveying is completed.——New gasoline hoists are being installed at the Rainbow and Craft mines in the same district.——F. M. Drescher, representing Prescott interests, has secured a bond on the Just claims, adjoining the Carter mine, near Oatman. A hoist will be installed and a shaft sunk 300 feet.

PIMA COUNTY.

The Tombstone Consolidated Mining Co. has unwatered the shaft below the 800-ft. level. The work is proceeding slowly from that point as there is a heavy flow of water in the mine. The company is anxious to get the new machinery installed and the water lowered to the 1000-ft. level as ore of shipping grade was opened there before operations were suspended.

PINAL COUNTY.

Daniel MacFarland, of Los Angeles, has secured a bond on the claims of S. J. Tribolet and associates in the Ray district. The bond has been set at $46,000 and runs for a year from next July when the first installment of 10% is to be paid. There are seven claims in the group which will be prospected by churn-drilling.

YAVAPAI COUNTY.

(Special Correspondence).—The Humboldt smelting plant, which has passed to the control of the Consolidated Arizona Smelting Co., is being re-modeled, improved, and enlarged under the direction of B. H. Bennetts, general superintendent, M. J. Heller, consulting engineer, and Theodore L. Genter, construction engineer. The two reverberatory furnaces, for which crude oil is to be used as fuel, are being re-built, their flues enlarged and a new stack erected, giving each furnace the capacity of 200 tons per day. A new blast-furnace for copper ore, 48 by 170 in., purchased from Power & Mining Machinery Co., is being installed. A Connersville blower has been ordered. The two stands of converters, which were a part of the original plant, are being put in order. The converter building is of sufficient length for additional converter stands. The matte will be handled by a 30-ton electric crane, which is already in position. The slag will be dumped at the brink of Agua Fria canyon from slag cars drawn by an electric locomotive. The power-plant contains two 450-hp. Nordberg engines for driving electric generators, and a Nordberg blowing engine to supply the blast for the converters. One of the principal changes at the plant relates to the economical handling of the ore by mechanical devices. The ore is brought to the receiving bins in bottom-dump cars. These bins have the inverted V bottom, whereby the ore can be discharged from both sides through chutes into 2½-ton cars, the tracks for which make a continuous circuit of the receiving bins, sampling mill, and storage bins from which the furnace charge is made up. These cars are drawn by an endless cable, the latter operated by a 25-hp. motor and winding machine, running at a speed of 250 ft. per minute, carrying five cars which are sufficient to handle 600 tons of ore per day. The storage bins, 48 in number, are each 15 by 15 ft., 20 ft. deep, having hopper bottoms, through which the ore drops into charge cars, and these are hauled by an electric locomotive to the charge-floor of the furnaces. A trestle is being built from the coke yard to the charge-floor, to support tracks over which the coke required for the charge will be delivered. The water-supply for the plant and for domestic use is pumped from wells in Chaparal gulch to a 100,000-gal. tank. The water from the blast-furnace jackets, and that from the condensers in the power-plant, is carried to a storage pond through a 12-in. wooden stave pipe, the latter going through a 260-ft. tunnel that serves to cool the hot water. This pond water, after settling and filtration, is pumped into the main distributing tank again. The greater tonnage of ore required to operate this plant is to be brought from the company's Bluebell mine, three miles from Bluebell siding on the Santa Fe branch. The ore is conveyed from the mine to the railroad over a Broderick & Bascom aerial tramway. The mine is operated through a 500-ft. incline shaft that will now be sunk 100 ft. deeper. This intersects the vein at the 200-ft. station. A 2-ton skip is operated in the shaft by a 75-hp. electric hoist. Other equipment consists of a 9-drill air-compressor, the drills being 3⅛-in. Ingersoll-Rand. The plan is to draw a considerable tonnage of custom ore from mines in the vicinities of Mayer, Poland, Crown King, Chaparal, Cherry, and other camps of the county. The equipment at Humboldt includes a concentrating mill, in fair order, and the question of operating this later is to be considered. Besides having a machine shop, the company has a foundry, pattern shop, and cupola iron furnace. While the plant is well equipped for steam-electric power, it is probable that the necessary power will be purchased from the Central Arizona Power Co., one of whose transmission lines extends from its Fossil creek plant to Humboldt.

Humboldt, January 27.

The Federal Mining & Milling Co. is installing an 80-hp. boiler and 6-ft. Huntington mill in its plant in the Cherry Creek district.——At the Dividend the 10-stamp mill is running one shift per day crushing 20 tons of ore.——The Humboldt Mining Syndicate is opening a vein of vanadate of lead. A hoist is to be installed at the property at once.——Operations have been resumed at the Baumen properties.

YUMA COUNTY.

C. C. Burger, representing New York interests, has purchased the Muderbach group of 23 claims ten miles south of Bouse from the Excelsior Gold & Copper Mining Co. There have been two shafts sunk on the claims for about 100 ft., opening a fair grade of copper ore with some lead and gold. New machinery will be installed and the property thoroughly prospected.——At the Shamrock property, nine miles from Vicksburg, the shaft is down 115 ft. on the vein. The ore contains a high percentage of silver and copper, and shipments to the smelters from that taken out while sinking, have paid the running expenses of the property.

CALIFORNIA.

EL DORADO COUNTY.

(Special Correspondence).—W. H. Knowles has secured a bond on the Georgia Slide mines, near Georgetown, which have been worked continuously since 1853. In this property there are belts of slate from 25 to 50 in. wide, with numerous small seams of quartz which have a high gold content. The miners follow these quartz seams, take out the quartz, crush it in a hand mortar by a 10-lb. pestel on the end of a swing pole, and recover the gold by panning. The slate is broken down and thrown into sluice boxes laid on a steep grade. In the bottom of the boxes are round blocks of wood which acts as riffles and collect the gold. From these sluicing operations for so many years, an enormous tailing dump has accumulated, containing 2,000,000 tons of ore that averages $3.50 per ton. There is probably as much more in the mines, and the deepest workings are 50 ft. below the adit, which is run in from the base of the mountain. In addition to the mine and dump, there is a ditch which is a part of the holdings of the owners, and will furnish water to operate a 1000-ton mill. The local water company furnishes water for power at 15c. per miners' inch.

Georgetown, January 29.

MARIPOSA COUNTY.

A $900 pocket was opened at the Hornitos mine in the Hornitos district while doing the assessment work. Nothing but the labor necessary to hold the ground has been done at the property for the last 30 years, but the finding of several rich pockets has attracted attention to the district and it is probable that work will be resumed at the property in a more energetic manner.

NEVADA COUNTY.

The stormy weather has delayed the work at the Colling property at Rough and Ready, but the boiler, hoist, and pumping-plant has been hauled to the mine and will be installed at once.——The Sierra de Ore Mining & Development Co. has secured a 20-year lease on the claims of the Washington Mining & Milling Co., in the Washington district. There is a 20-stamp mill on the Giant King claim and a large orebody opened by three adits. The company owns an excellent water-right and one of the conditions of the lease is that the new company build a complete electric plant to furnish power for the mine and mill.——George E. Fitz Gerald, the manager for the new company which has taken over the Champion properties, is expected from the East shortly. It is planned to unwater the Champion shaft to the 2400-ft. level. New machinery will be installed and a new central shaft may be sunk to open all the properties of the group.——D. M. Stevenson and B. Barns have secured a bond on the Canada Hill mine, in the Nevada City district, and are putting the machinery in order for operation. It is estimated that it will take six weeks to unwater the property, when work will be started on the nineteenth level to open the St. Louis vein and the south drift extended along the Canada Hill vein on the twentieth level. ——Harry B. Gray, superintendent of the Grover-Murphy mine, has made arrangements to secure air for power from the Mountaineer plant and resume sinking at the 300-ft. level. A gasoline engine has been ordered and will be installed at the property to furnish power for drilling and hoisting.

PLACER COUNTY.

George H. Chadeayne has purchased the Enterprise mine, in the Meadow Lake district, from A. S. Cook, and has made a number of tests on the ore to determine the most advisable method of treatment. The property was located in 1865 but has never been thoroughly opened. The new owner will probably build a mill and cyanide plant.

SIERRA COUNTY.

The drift at the Monte Cristo gravel mine has followed the channel for 95 ft. in a northerly direction and a cross-cut has been started for the west rim. A cross-cut will be started shortly for the east rim and the main adit driven to the limit of the claim.——A lower adit at the Good Faith claim, near Downieville, cut a 5-ft. vein of milling ore.

SISKIYOU COUNTY.

The Manley Lumber Co. has secured the contract to furnish the lumber for the new mill being erected at the Oom Paul mine and is delivering the timber to the company. The foundations have been laid and work has been started on the main building. Timbers for the mine have been delivered and a crew of surveyors are running a line for the power company's wires.

TRINITY COUNTY.

D. H. Lane has secured a bond on the Knob mine, in Eastman gulch, with an option to purchase the property for $35,000, the option to expire May 1. Paulsen & Collins and Wilson & Silligo have leases in the mine that will run till May. These lessees have shipped considerable ore from the property that assayed as high as $700 per ton.

COLORADO.

CLEAR CREEK COUNTY.

(Special Correspondence).—A 4-in. streak of ore has been opened in a vein just intersected by the Ramsdell adit that assays 23 oz. gold per ton. This vein is supposed to be an extension to the west of the Homestake where ore is being mined that contains 32 oz. gold and 37 oz. silver per ton. G. W. Teagarden is manager.——Work has been resumed in the advance of the Paragon adit.——W. Kramer, has uncovered a 6-in. streak of 350-oz. silver ore on the Lost Treasure property, situated on Columbia mountain. The ground is being prepared for stoping and regular shipments are to be started.——The shaft on the Sporting Times mine, Alpine mountain, is being cleaned out and retimbered. There is said to be a body of ore exposed on the lower level that is from 8 to 10 in. wide that will mill from $80 to $85 per ton gold and silver. A. H. Colburn is the owner.——The Waldorf Metals Co. has secured a lease on the property of the Wilcox adit workings, with the exception of a small block of ground 5000 ft. from the entrance, where a raise is now being put through to connect with the upper workings.

Georgetown, January 29.

(Special Correspondence).—More men are employed at the Shafter mine, on Bellevue mountain, than at any time during the last six months. The Hudson mill is running night and day treating the product and a reserve of 500 tons has accumulated in the bins. A. H. Roller is manager. ——Increased development has been started by the General Consolidated Mining Co., operating a large group of claims. Lumber is now on the ground and large ore-bins are being constructed preparatory to starting shipments. C. L. Jaynes is manager.——Shipments of concentrate were started this week by the Tanquay Mining Co.——A rich discovery has just been made on the Big Horn property, operated through the Cymric adit. The streak is 6 in. wide with a fair content of wire silver.——The Cincinnati mine, in Hamlin gulch, is working a 4-in. streak of ore that is worth from $40 to $60 per ton. N. M. Galloway is the owner.

Idaho Springs, January 28.

GILPIN COUNTY.

(Special Correspondence).—The Pine Comb Gold Mining Co., operating in the Wide Awake district, is preparing for extensive development. E. Shoush is manager.——Three feet of ore has been cut on the hanging wall of the Sayre-Mammoth vein at the 500-ft. level of the Cook shaft that is worth $24 per ton. T. B. Bassett is manager.——A shipment of two carloads of ore from the King Bee mine, op-

erated through the Newhouse tunnel, were settled for at the rate of 5.26 oz. gold and 71 oz. silver per ton.——Sherr & Co., leasing on the 1000-ft. level of the Old Town, are sending out three carloads of ore per week that is worth on an average of $35 per ton.——Hughes & Davis, lessees of the Champion mine, have started shipments, the ore being sent to the custom mills at Black Hawk.——Harris & Co., operating on the 100-ft. level of the Russell mine, are sending out heavy shipments, the concentrate being worth $27 per ton. Occasional shipments of smelting ore assaying 2 oz. gold and 23 oz. silver per ton, with 5% in copper, are made.

Central City, January 28.

LAKE COUNTY.

The Spring Steel adit, in California gulch, which is being driven to open the Lilian property, is in 500 ft. and will be continued 400 ft. more to cut the main veins of the mine. Several stringers have been intersected and a raise started on one of them. J. Clarence Hersey is in charge of the work on this property and a similar undertaking at the Lovejoy group on Printer Boy hill.——The Breece Hill Mining & Development Co., operating several leases in Adelaide park have completed a shaft on the Dolomite claim and have commenced shipping ore.——A station is being cut at the 200-ft. level of the shaft sunk in the St. Louis adit, and as soon as this work is completed the shaft will be sunk another 200 ft.——A new 1200-hp. electric hoist has been installed at the Cleveland mine and operations resumed.——About 400 tons of sulphide ore per month is being shipped from the Adelaide property which is being worked through the Yak tunnel.

OURAY COUNTY.

A new electric hoist has been installed at the Thistledown. The mill and tramway will soon be in working order and a larger crew will be put to work in the mine.——The lessees of the Wedge mine shipped the third car of high-grade silver ore.——At the Black Diamond property, north of Ouray, the operators are blocking out the ore and storing that taken out in the development on the dump. This will be shipped to the pyritic smelter as soon as the furnace is ready for operation.

SAN JUAN COUNTY.

Lumber is being hauled to the Silver Lake mine from Silverton and the terminal which was destroyed by fire a few months ago is being replaced. The mines have been idle for over a year but it is understood that operations are to be resumed this spring. As there are about 200 claims in the group with some 18 miles of underground work the resumption of work will mean a great deal for the district.

SUMMIT COUNTY.

M. A. Wright and Louis Lipp, operating the S. B. Wright property on Gibson hill under lease, have opened a body of carbonate ore and made several shipments to the smelters.——A small force of men is working at the Wire Patch and the management expects to cut the vein within the next 100 ft.——Regular shipments of high-grade zinc ore are being made from the Sallie Barber and Little Sallie mines.——The drift on the adit level of the King Solomon mine, at Frisco, opened a shoot of high-grade lead-silver ore containing some copper and gold. The vein is 9 ft. wide, but the shipping ore is only from 10 to 14 in. The adit intersected the vein at a vertical depth of 2000 feet.

TELLER COUNTY.

Allen L. Burris, manager for the El Paso Consolidated Gold Mining Co., has directed letters to the lessees stating that the leasing system would be continued in the company's mines the coming year, and that applications for leases should be filed with the company before March 1.——The Roosevelt deep drainage tunnel cut a 30-ft. vein of milling ore when in 12,245 ft.——E. Edison, operating a lease on block 152 in the Crescent mine, on Womack hill, opened a body of shipping ore at a depth of 120 ft.——A new set of rolls has been placed in the Trilby mill, increasing its capacity to 70 tons per day, and operations resumed. Recent work on the eleventh and thirteenth levels in the mine have opened two shoots of good milling ore.——A rich shoot has been cut by the lessees in the Orphan Belle mine and a shipment sent to the mills that will average about 2 oz. per ton.——The Vindicator Consolidated Gold Mining Co. has declared a dividend of 3c. per share, payable February 15.——The shaft of the lessees at the Gold Dollar mine cut a body of $30 ore when down 18 ft., and shipments are being made.——A cross-cut has been driven to the Modoc vein on the eleventh level of the Modoc mine on Bull hill and a raise started in the ore. The vein is from 18 in. to 8 ft. wide, and assays as high as $60 per ton.

IDAHO.

IDAHO COUNTY.

S. R. Gayton, manager for the Penn-Dixie company, has purchased the Dixie townsite of 153 acres near Dixie and will build a power-plant utilizing the power developed by the water of Crooked creek. At the mine the company is to add six stamps and a cyanide plant to the equipment in the near future.——The Majestic company is installing a new 60-hp. boiler, engine, and compressor.——A 20-ton mill is being erected on Hazlitt & Trader's Oliva property.——Operations are to be resumed at the Dixie Royal property this month.

KANSAS.

CHEROKEE COUNTY.

(Special Correspondence).—In the Baxter Springs camp many companies are making preparations for the enlargement of the mills already on leases or the erection of new mills. The Mission plant of 500 tons is now completed and has started operations. The Omaha-Petersburg company is making plans for the erection of the most costly plant in the camp, the plans having already been accepted and the contract will be let at once. Many new devices for the saving of the sludge and fine will be installed. The plant will be completed by May 1.——The capacity of the Okla mill is being increased to 400 tons by the installation of new machinery, including crushers, boilers, and jigs. Oil burners are being placed under all the boilers, the fuel bill being thus reduced 30%.——The capacity of the Mason mill is being doubled by the installation of new Faust jigs and the tables will no longer be used.——The Tennessee Metal Producing Co. has taken over the lease and mill of the Quivera Mining Co., and the 10-acre lease of the old Mascotte mine and will erect a tramway to the mill from the Mascotte shaft. Shafts are in ore on both properties and the lessees will begin active operation at once.——In the Galena camp the Big Four Co., operating a 30-acre lease in the Cave Springs camp adjoining the Herald mine, is taking out good ore from the shaft at 90 ft. Drifts have been run at this level. Hand jigs have been installed for the cleaning of the fine ore but the coarse rock is piled aside awaiting the erection of a mill. There is considerable quantity of the fine ore in the bins as the company has made no sales as yet.——The find made recently on the Foster land continues to improve as work advances. After penetrating the ore at the upper level the drill entered barren ground at 80 ft., continuing to 85 ft., after which a fine run of ore was again struck. The ore is of high grade, assaying more than 62% zinc.

Galena, January 28.

MONTANA.

SILVER BOW COUNTY.

(Special Correspondence).—The new year starts off very badly for the Butte district, so far as copper production is concerned, and while January will show a production larger than that of December, it will still be far below the normal for the district. While the Butte output is restricted, all evidence goes to indicate that within the next year or two Montana will again take the lead as a copper producer. This condition will be brought about by the contribution from the Corbin-Wickes district. Three or four companies operating in that district will be producing copper in considerable quantities within a year.——The Boston & Corbin Copper Co., of which N. L. Amster is president, has already blocked out, ready for the concentrator, no less than 234,000 tons. This company is installing a large and complete electrical equipment.——Stephen R. Dow, president of the Corbin company, says that company has blocked out

sufficient tonnage of copper ore to justify the installation of a large concentrator, and it is understood that orders have been placed for the machinery for a mill by the company. Another important company, and which will shortly be ready for production, is the Robert Emmet Copper Co., which probably has the most completely equipped property in the district. The plant is completely operated by electricity.——The board of directors of the Butte & New York Copper Co. has been reorganized and the Butte & Superior company now has six members on the board, the last of the old directors to retire being H. E. Mittenhal, of New York. ——The British-Butte Mining company has made an annual report of its financial condition showing a gross indebted-

Map of Butte District.

ness of $221,580, its capitalization being $5,000,000.——The Rarus mine of the Butte Coalition company, the West Colusa of the Boston & Montana, the Parrot mine of the Parrot company, and the Moonlight of the Washoe company, are still idle. Some changes are being made in the shaft of the West Colusa and it will be several months before that mine is operated again.

Butte, January 28.

NEVADA.

CLARK COUNTY.

The new station-pump has been installed at the 300-ft. level of the New York property in the Searchlight district and sinking will be continued to the 500-ft. level. A power-drill has been purchased by the company and sinking by hand abandoned.——The Knight custom mill has been completed and is to start operations in a few days.——The west cross-cut on the Duplex Extension ground has opened a number of stringers of fair ore.

ESMERALDA COUNTY.

The shaft of the Goldfield Annex opened five feet of $50 ore just after passing the 775-ft. point, and is again in similar material at a depth of 805 ft. The ore dips at an angle of 30°, and is in a highly metamorphosed and silicified latite. A considerable amount of copper sulphide is present in the ore.——J. O. Buckley and associates have formed the Queen Consolidated Mining Co. and secured a lease upon blocks 10 and 11 of the Union Jack claim of the Atlanta estate, the ground being part of that which was at one time held by the Nevadan & Eastern Leasing Co. The two blocks adjoin the old June Atlanta lease, which was operated by Mr. Buckley and associates, and are close to the Precious Metals, Cherokee, and LeMance claims, all of which are now operating. The June Atlanta shaft will be used by the new lessees, the lease being granted under condition that the June Atlanta shaft, now 400 ft. deep, would be sunk to 750 ft., with two shifts, and a lateral cut from the 750-ft. level to the ground secured by the lessees. Work upon the new lease began February 1. The old June Atlanta shaft is double-compartment, well timbered, and equipped with a 60-hp. electric hoist.——The Grizzly Bear shaft reached the 900-ft. point with no change in formation, and sinking will continue till the extention of the Clermont vein is opened. The formation is latite, highly silicified and containing some iron sulphide, the value, however, being so low as to be neglible. Wallace McGregor, the manager of the Grizzly Bear, does not expect to open the ore until the 1000-ft. level is approached.——Work on the Nevada Eagles property, to the west of Goldfield, is progressing steadily. Some ore is being sacked, and development work is going ahead regularly, drifts being run on the veins in order to prove their value. The ore-shoot contracts and widens, the value being somewhat erratic. When a little more is learned about the formation the vein will be tapped at the 400-ft. level and explored.——The recent discovery at the Campbell lease, on the Diamondfield Black Butte property, continues to improve. Two shipments totaling about 25 tons have been forwarded and assays of grab samples taken from 25 sacks averaged $500 per ton. The vein is now 3 ft. wide, and the ore is sorted at the mine before it is shipped.

LYON COUNTY.

A 75-ton continuous Hunt filter is being installed at the Phillips mill at Silver City. It is expected to effect a considerable saving as this will do away with the previous system of storing the tailing. The filter is to be completed some time this month and later in the spring the whole mill will be overhauled and repaired.——Sinking has been stopped at the 800-ft. level of the Overman on account of the heavy flow of surface water. A good vein has been opened at that depth and in the spring the shaft will be unwatered and sinking resumed at that level.

NYE COUNTY.

(Special Correspondence).—A. C. Eisen, president of the Mayflower Consolidated Mining Co., has agreed to the authorization of a call for a special meeting of the stockholders at Rhyolite on February 5. A new directorate is expected to be chosen and it is believed that the difficulties of the company will be adjusted. Mr. Eisen has decided not to press his claims against the company.——The production of the Montgomery-Shoshone for the past four or five months shows a falling off from the previous records. ——The Sunrise Pioneer Leasing Co. is pushing work on the K. K. lease. The adit discloses low-grade milling ore. ——The Johnnie Mining & Milling Co. has passed into the hands of A. D. Meyers, T. A. Johnson, L. J. Christopher, and associates. L. J. Christopher has been elected president, M. S. Gregory, treasurer, and T. A. Johnson, manager. The property is equipped with 16 Nissen stamps and a Lane mill, with the daily output exceeding 100 tons. The new manager states that the capacity of the mill will be increased to about 200 tons per day. Another Lane mill will probably be installed. The ore assays from $4 to $15 per ton, and is handled at a cost of $3.50 per ton.——As a result of the intensely cold weather at Manhattan most of the placers have been forced to close. The Wilson lease, on Wolftone Extension, the Bisell lease, on September estate, and two or three others are working whenever the weather permits.——The Manhattan Milling & Leasing Co. is shipping ore from lease 14, on Union No. 9, to the Canyon mill. It averages about $30 per ton.——The Gold Crest has finished its prospect shaft in the main placer gulch and is said to have opened pay gravel. O. B. Steen and associates are working on the Fulkerson, Price & Weedman and Allison claims. The company has acquired two miles of East Manhattan gulch and will thoroughly test the gravel.

Rhyolite, January 27.

STOREY COUNTY.

The Comstock-Phoenix company has completed the installation of its new electric hoist and power-plant at its

property in the Brunswick district, and are sinking a winze on the ore at the adit-level. This is down 90 ft., and it is the intention of the management to erect a mill if the value continues the same.——The Charles Butters Co., Ltd., purchased the Monte Cristo property at the junction of Six and Seven for $20,000 and are installing an electric hoist and No. 5 Cameron sinking pump. The shaft was sunk 150 ft. in early days and over $1,000,000 worth of ore taken from the surface workings.

WHITE PINE COUNTY.

(Special Correspondence).—The re-timbering of the Giroux shaft is progressing at the rate of 17 ft. per day, and it is expected to have it in working order about the middle of March. Sinking has been resumed and it is reported that work will be continued until the 2000-ft. level is reached. The inside dimensions are 18 by 18 ft. It is reported that the company is contemplating the sinking of two new shafts, one of which will be on Rickard Ely group. ——Ely Resurrection is pushing work on the Rattler adit where a 4-ft. body of medium-grade ore has been opened. A Star drill, capable of going to a depth of 2000 ft., has been ordered and will be placed in operation before March. It is intended to sink a 2 or 3-compartment shaft when the drilling has been completed.

Ely, January 29.

OREGON.

MULTNOMAH COUNTY.

(Special Correspondence).—Considerable interest is manifest here in the proposed United States National Fair. This project is under the auspices of the United States Agricultural & Industrial Exposition Co., which is incorporated under the laws of Delaware, with a capital of $1,000,000. The purpose of the incorporation is to hold an annual national exposition in one of the Western States. It has not yet been decided in what city of the West the first fair will be held, but this question is to be decided soon. The directors of the company are: Albert E. Brown, Syracuse, I. D. Graham, Topeka; George S. Walker, Cheyenne; Joseph E. Wing, Mechanicsburg; B. F. Dixon, Raleigh; Charles W. Bush, Wilmington; James Handly, Quincy; Robert P. Lyon, Hartford; and E. Alexis Taylor, director general, Hartford. The management has announced its determination to give the mineral industry of this country a strong representation at the exposition.

Portland, January 29.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The 240-stamp Amicus mill and No. 1 cyanide plant, together with 200 stamps in the Homestake mill have been started.——The Wasp No. 2 mill, at Flat Iron, was set on fire and completely destroyed from a spark from a fire that was built to dry out one of the tanks preparatory to painting it. The loss amounted to between $50,000 and $75,000 and was partly covered by insurance. The company will re-build the plant at once.

UTAH.

SALT LAKE COUNTY.

At the annual meeting of the stockholders of the Black Bird Copper-Gold Mining Co., held at Salt Lake, a considerable majority of the outstanding stock was represented, and B. N. Lehman was elected treasurer and general manager. It was decided at the meeting also to continue the development of the company's claims, situated on territory adjoining the property of the South Utah Mines Co., formerly the Newhouse company, in southern Utah, by means of core-drills. This work was started last spring and continued until late fall, when the severe weather forced the suspension of active operations. One hole is already down a considerable distance and a second one is well under way, and as soon as possible the work will be continued.——Recent developments in the property of the Utah-Apex company at Bingham Canyon have so increased the reserve of ore that the management has decided to increase the plant to handle 500 tons of ore per day. On a recent shipment to the smelter the assay was 11 oz. silver per ton with 37% lead and 1.6% copper.

SUMMIT COUNTY.

The Utah First National Mining Co. is to commence operations this spring on the group of claims recently acquired in the Deer Valley district. At the property, which is north of Park City, the shaft is down 225 ft., but had to be abandoned on account of the heavy flow of water opened at that level. It is now understood that as soon as the weather modifies enough to allow material to be hauled to the mine an adit will be started farther down the hill that will tap the vein at a depth of 700 ft.——Work has been temporarily suspended at the American Flag mine.——At the Ontario H. M. Crowther and associates are shipping regularly from their lease on the upper levels and are employing 25 men in the work.——An assessment of 5c. per share has been levied by the directors of the Wabash Mining Co., payable before February 21, and work is to be resumed at the property.

WASHINGTON.

FERRY COUNTY.

Alfred H. Stiles is driving an adit on the Good Ore mine that will cut the vein at a depth of 75 ft. There is a quartz vein on the property that is 3 ft. wide and assays well in gold and silver.

SNOHOMISH COUNTY.

(Special Correspondence).—Jacob S. Hett has been appointed receiver of the Atlas Corporation of Maine, which is operating the Wayside mine at Granite Falls, this action being taken to facilitate reorganization of the company. Work on the lower levels continues to be retarded by the excessive flow of water. Since the commencement of the switchmen's strike, a portion of the crew has been kept cutting wood to take the place of coal for fuel.——There will probably be no train to Silverton for about two months on account of the washouts between that point and Robe as a result of the recent floods. One bridge will have to be partly re-built. These conditions will retard mining operations along the Monte Cristo branch of the Northern Pacific.——The Bunker Hill Mining Co. is operating two diamond-drills in exploration work at its property at Reiter. The smelter will not be blown-in unless larger orebodies are opened or the price of copper advances.——A gasoline locomotive for use on the narrow-gauge line which was completed last fall between the Apex mine and the Great Northern, near Berlin, is on the way from the Eastern factory. This line is six miles long and the cars at present are hauled by a team of horses. The ore goes to the Everett smelter, where it is run through the arsenic plant and afterward sent to the Tacoma plant. There are 20 men on the Apex payroll.——The Seattle-Cascade Mining Co. has just completed the installation of a water-power plant and a 5-drill compressor. It is driving a 300-ft. cross-cut which is expected to intersect the main vein 800 ft. below the upper workings. This company has seven to ten feet of ore uncovered, assaying high in gold, silver, copper, and lead.

Everett, January 29.

MEXICO.

HIDALGO.

The Real del Monte y Pachuca company has declared a dividend of $200 per share which is the largest dividend declared by this company.——The Maravillas y Anexas paid $4 per share January 26, and the San Rafael Anexas properties paid dividends on January 27 as follows:

SAN RAFAEL AVIADOR.

San Rafael	$16
Sorpresa	24
Soledad	8
	$48

SAN RAFAEL AVIADO.

San Rafael	$16
Sorpresa	30
Soledad	10
	$56

The San Rafael company is considering plans for increasing the capacity of the mill.

Personal.

Professional men are invited to send news of their engagements and travels. Such news is interesting to friends.

POPE YEATMAN has gone to Chile.

C. G. CAHILL has gone to Tepic, Mexico.

W. H. KNOWLES is at Georgetown, California.

BENNETT M. CAHILL has gone to Wonder, Oregon.

C. D. KAEDING has gone to Minas Prietas, Mexico.

S. FRAZIER has gone to Chicago from Bristol, Tennessee.

HORACE V. WINCHELL is examining mines in Arizona and Mexico.

JOHN D. HOFFMANN has gone to Guadalupe, Zacatecas, Mexico.

P. H. MCLAUGHLIN has gone from Las Vegas, Nevada, to Kingman, Arizona.

F. D. GROSS, of the Colorado Iron Works, was at Jerome, Arizona, last week.

MIGUEL DE LAVEAGA has arrived in San Francisco from San Dimas, Durango, Mexico.

E. C. B. HEDEN is with the Konieh Mercury Syndicate, Ltd., Konieh, Turkey, in Asia.

J. H. MORELAND, of Kansas City, was in San Francisco, on his way to Parral, Mexico, this week.

EDWIN E. CHASE, mining engineer, Denver, Colorado, has been in Yavapai county, Arizona.

EDWARD G. ACHESON was presented the Perkin medal at a meeting of the Chemists Club at New York, January 21.

H. P. HENDERSON has resigned as superintendent of the Goldfield Consolidated and gone East on personal business.

LAFAYETTE HANCHETT and W. H. WILEY, with their families, sail from San Francisco today on the *Cleveland* for a vacation trip around the world.

ALBERT SPIES has retired from the editorship of *The Electrical Review* to take charge of the *Foundry News*, a new monthly to be published in New Rork.

T. N. STANTON has resigned from the service of the Old Dominion Copper M. & S. Co., and is superintendent for the Magistral-Ameca Copper Co. at Ameca, Jalisco, Mexico.

FRANK A. ROSS, who made the final report on Cinco Minas, Jalisco, Mexico, for the Estate of Marcus Daly, has returned to his headquarters at the Spokane Club, Spokane, Washington.

R. A. CONRADS has resigned from the Esperanza Mining Co., El Oro, Mexico, and has formed a partnership with A. S. PERRIER. His address will be Ixtlán del Rio, Territory of Tepic, Mexico.

GELASIO CAETANI has resigned the position of mill supertendent to the Bunker Hill & Sullivan M. & C. Co., becoming consulting metallurgist to that company with headquarters in San Francisco.

J. B. TYRRELL has been spending some time looking over the new gold finds near Porcupine lake in northern Ontario. He is now delivering lectures on the 'Structure and Origin of Placer Deposits' at McGill University.

Obituary.

A. F. WUENSCH, who died at Albuquerque, New Mexico, December 19, had a high and deserved reputation as a mining engineer. He was best known in Colorado, the scene of most of his life's work. Coming to Leadville in the early days of that camp with some knowledge of mining, he took up the newspaper work and was for many years the best known newspaper correspondent in the district. At a later period, deciding to go into mining work, he prepared himself by a course at Freiberg, returning to Colorado to become examining expert for D. H. Moffat. In this position he obtained wide experience and had an important influence on the development of the State. Still later he began to operate on his own account and was successful in this as in other things, amassing a comfortable fortune.

Review of January Copper.

By MISHA E. APPELBAUM.*

The beginning of the new year found copper firmly intrenched upon a 14c. delivered 30-day basis for electrolytic and 14⅛ for Lake, with the bulk of the requirements of most of the consumers covered for the months of January and February. Outside of a slight March inquiry there was little demand for copper during the month, the only exception being for wire-making, which industry continued to show improvement and caused the wire companies to buy additional supplies for early delivery. The statistics made public on January 10 showed a net decrease on this side of 11,000,000 lb., being principally due to decrease in production. It must be remembered, however, that the curtailment of output, as well as interference with production due to the strike and weather, was not expected to make itself felt during the month of December, since a reduced output at the mines in December means a corresponding reduction in the refined output sixty days later. The heavy curtailment should be shown in the statistics for the months of January and February and published on the 10th of each month. The figures for January should show a decrease of at least 20,000,000 lb. and those of February of about 25,000,000 to 30,000,000. About January 13, and again between January 24 and 26, due principally to the heavy declines in securities, several concerns which had heretofore held for higher prices, pressed copper for sale, and this, together with the anxious selling by second-hands, caused recessions of ¼ to ⅜c. per lb. Apparently this had little influence on the London market. As soon as the latter would display a firmer tendency, the metal would again be quoted here at figures mentioned in the first paragraph. Toward the end of the month, on the announcement that the Anaconda would increase its capital and that this would be the first principal step toward the eventual amalgamation of the principal copper properties, the London market showed considerable strength and the domestic consumers displayed more anxiety to cover some additional March requirements. They would have gladly taken copper at the same figures for April and May, but found few sellers.

From all available information, I am firmly of the opinion that we can figure with safety on a domestic consumption of a minimum of 70,000,000 lb. per month for at least the first six months of the present year, and that we can also rely on Europe to take about 50,000,000 lb. per month, so that it will be rather easy to account for deliveries of 120,000,000 lb. per month. The production for the first three month of the present year should be in the neighborhood of 100,000,000 to 110,000,000 lb. per month, and I believe that the statistical position of the metal is favorable to maintaining, at least, the present prices. It is, however, natural to assume that some of the copper producers will not sell all of the copper produced, but that they will withhold a portion of their production for higher prices, as it is the concensus of opinion that within a comparatively short period sufficient independent mines will combine, to give the market the stability in price desired by all.

*President of the New York Metal Selling Company.

Geological Survey Review of Gold and Silver Mining in 1909.

Compiled by WALDEMAR LINDGREN and H. D. MCCASKEY.

Gold mining in the United States progressed satisfactorily in 1909. The year was marked by increasing recovery from depressed conditions and by general advance in the development of proved mines and districts; although there was a generally increased production of the base metals, and as a consequence an augmented gold output. From the preliminary figures of the Director of the Mint, pubilshed last week, it is estimated that the output of gold for 1909 reached the unprecedented total of $99,232,200, an estimated increase of $4,672,200 over the production for 1908. In spite of serious drawbacks, first in one mining camp, then in another, the production of gold has increased more than $4,000,000 in each of the last two years, and the outlook indicates, unless present abnormal conditions in the Black Hills should continue or curtailment be shown elsewhere, a production of over $100,000,000 in 1910. However, so important are some of the great mines that a prolonged continuation of the present labor difficulties at the Homestake mine in the Black Hills, for example, even with conditions elsewhere normal, might easily reduce the output to less than $95,000,000 for the current year. Although the industry has been generally progressive in 1909, the increased production has resulted chiefly from operations in six States and Territories, and preliminary figures indicate a decrease in actual production from fourteen others. It is possible, however, that later figures may shift the distribution to some degree.

The most notable increase in production was that in Nevada, where the preliminary figures indicate a gain of $3,219,000 and where mining was active, particularly at Goldfield and Tonopah. At Goldfield the large new mill of the Goldfield Consolidated Mines Co. was steadily operated, partly on a grade of ore that had been shipped in 1907 but stored throughout 1908. Nevada generally had a prosperous year.

The next largest increase, of $1,941,600, is indicated in California, where lode mining has been continuously productive and where dredging for gold has been of growing importance. For Alaska an increase of $1,088,800 is indicated, and Montana and Arizona show gains in production, partly due to a greatly increased copper output. On the other hand, a decrease of $916,300 is indicated in Colorado, chiefly at Cripple Creek, where production will probably not greatly increase until the completion of the Rooseveit deep drainage tunnel. Gold mining was otherwise generally progressive in Colorado. A decrease of $892,300 is shown in South Dakota, whose great Homestake mine has been closed since November 23, 1909, owing to labor difficulties. A marked decrease is indicated for Oregon, but the production of gold from Utah and Idaho remains practically as in 1906. A decreased output is indicated from the Philippines, where an increase was expected, as it had been understood that the dredging operations at Paracale and the deep mining in Benguet have been increasingly productive.

General decreases are indicated for the Southern Appalachian States. The small annual contributions of gold from Tennessee, Texas, Wyoming, and Porto Rico have remained practically unchanged. In general, gold production increased mainly from placers and the mining of silicious ores, and to a smaller degree from copper ores, from which gold is a by-product.

According to estimates from the Bureau of Statistics, the United States imported in 1909 gold valued at $13,510,513 in foreign ore, $26,233,368 in foreign bullion, and $6,059,313 in foreign coin, and exported gold valued at $498,822 in domestic ore, $43,021,545 in domestic bullion, $86,803,265 in United States coin, and $2,717,725 in foreign coin, the excess of exports over imports thus being $87,238,323. In 1908 there was an excess of exports over imports valued at $30,939,163. The imports in 1909 were made up chiefly of ore and bullion from Mexico and to a smaller degree from Canada and South America. The exports consisted largely of coin and went chiefly to South America, though large amounts of gold were sent to Japan, the United Kingdom, and France.

During 1909 the silver-mining industry suffered from low market prices for the metal and for copper and lead, from whose ores nearly 60% of the annual production of silver is recovered. The average price of silver in 1908 was 53c. per fine ounce, but it declined in 1909 to 52, or 25c. below the average for the last 30 years, a value not sufficiently attractive to justify the mining, under ordinary conditions, of low-grade silver ores. Notwithstanding the low market prices of lead and copper, however, the output of these metals was greater in 1909 than in any previous year, and it was chiefly for this reason, more especially on account of the increase in copper output, that the production of silver was maintained at about the same figures as in 1908, and at about 3,500,000 fine ounces above the average output for the last 30 years, even though the value was over $10,000,000 less than the average for this period.

The preliminary figures of the Director of the Mint give an estimated production in the United States in 1909 of 53,849,000 fine ounces of silver, valued at $28,010,100. This indicates an increase of 1,408,200 fine ounces in quantity, but a decline of $40,500 in value from the figures for 1908. The most notable increases of production in 1909, as compared with 1908, were in Montana, Utah, and Arizona, which are large copper producers and where the smelting industries were generally active in 1909. The indicated increases are 1,643,800 fine ounces in Montana, 1,082,100 in Utah, and 732,200 in Arizona. In Colorado there was little profit in mining and smelting low-grade ores, and a heavy decrease of 1,056,600 fine ounces, or about 10% of the output of 1908, is indicated. In both Idaho and Nevada decreased output is indicated, amounting to more than 500,000 oz. in each State. Smaller losses are attributed to Alaska, Missouri, New Mexico, Texas, and Washington.

The market for silver in 1909 offered little encouragement, as a largely increased foreign output, especially from the Cobalt district in Canada, was in competition with the domestic production. The failure of India to buy as largely as usual was only partly offset by better sales to China.

From estimates of the Bureau of Statistics the imports in 1909 were valued at $30,332,088 for silver in foreign ore, $12,431,150 for silver in foreign bullion, and $2,967,768 for silver in foreign coin. During the same year exports of silver were valued as follows: Domestic ore, $640,647; foreign ore, $68,278; domestic bullion, $54,336,904; foreign bullion, $1,223,426; United States coin, $170,258; and foreign coin, $570,831. The value of silver in excess of total exports over that of imports in 1909 was therefore $11,279,338. The imports of silver were chiefly in the form of ore and bullion, and came largely from Mexico and Canada, about twice as much from Mexico as from Canada. The exports consisted almost wholly of ore and bullion, and went chiefly to the United Kingdom, although important shipments were made also to Hongkong direct and to France.

Oil Wells Drilled in 1909.

The record of wells drilled in the Eastern States in 1909, as compiled by the *Oil City Derrick*, is given below:

Field.	Comp.	Dry.	Gas.
Alleghany	459	22	25
Bradford	571	27	15
Middle Field	510	57	17

Totals	16,882	2,805	1,271

Decisions Relating to Mining.

Specially reported for the MINING AND SCIENTIFIC PRESS.

PRESUMPTION AS TO OWNERSHIP OF MINERALS.

The presumption that an owner of the surface of a mining claim owns all minerals beneath it ceases when it is shown that a vein found beneath the surface has its apex in a claim belonging to another person. But the burden of proving ownership of such apex vein and its dip and descent to and underneath another claim in order to overcome the presumptive ownership of the surface owner is on the person who asserts ownership of such apex vein.

Keely *v.* Ophir Hill Consolidated Min. Co., 169 Fed. 601, Apr. '09.

TITLE TO MINERALS—ADVERSE POSSESSION.

A person claiming title to minerals as surface owner, after a severance from the surface ownership, must show actual, notorious, exclusive, continuous, peaceable, and hostile possession of the mine, independent of his possession of the surface, in the same manner as a stranger. Such actual possession may be shown by opening and operating the mine, and the possession is continuous if the operation is carried on at such seasons as the nature of the work permits or the custom of the community requires, if there is some proof to possession during an interval to connect the operation, when resumed, with the prior operations.

Gordan *v.* Park, (Mo.) 117 Southwest. 1163, April '09.

OIL AND GAS LEASE—FORFEITURE.

An oil and gas lease recited that if no well was sunk within 12 months, the lease should be void, unless the lessee should pipe gas to within 100 ft. of the premises of the lessors and give them free gas until the well was drilled. Subsequently an assignee of the lessee piped gas to the premises of the lessors as required by the lease, and the lessors commenced and continued to use the gas according to the terms of the lease and until the trial of a case brought by them to forfeit the lease; but the court decided that the use by them of the gas constituted a waiver of the right to forfeit the lease on the ground that no well was drilled within the 12 months.

Duntley *v.* Anderson, 169 Fed. 391, March '09.

OIL AND GAS LEASE FORFEITURE.

An oil and gas lease provided for drilling and operating oil and gas wells, and on failure to do so, the lease was to pay an agreed sum per day to the lessor for such failure or delay; and on failure to drill, operate, or to pay the agreed sum, the lease should be void. In an action that involved the forfeiture of the lease and the respective rights of the parties, it was decided that the provision that the lease should be void was for the benefit of the lessor, and that on a breach of the lease he might declare and receive forfeiture by proper notice, or waive the forfeiture and proceed against the lessee for failure to perform the covenants of the lease and that the title did not revest in the lessor immediately on the lessee's default.

Perry *v.* Acme Oil Co., (Ind.) 88 N. E. 859, June '09.

OIL AND GAS LEASE—RE-LEASE.

A gas and oil lease which provided that if no well was completed within 15 months, the lease should be void unless the lessee paid $1 per day for each day's delay, and that the lessee should drill an additional well each 60 days or pay $1 per day for each day's delay until three wells were drilled; and it also provided that the lessee should have the right at any time to cancel the contract or any part thereof if he drilled two wells on a certain part of the leased premises; but on failure to drill any well on the other part of the premises, he could not claim the right to retain the lease on the part of the premises on which the wells were drilled and cancel it as to the part on which the wells were not drilled and escape liability for failing to drill the three wells.

Ramage *v.* Wilson, (Ind.) 88 N. E. 862, June '09.

The Prospector.

This department makes a charge of 25 cents to subscribers not in arrears and $3 to non-subscribers for each determination. To ensure promptness in publication of the determinations, payment must be forwarded with specimens.

V. E. F., Jamestown, California: Oxide of manganese with limonite.

E. W. S., Crown King, Arizona: Hornblende schist or amphibolite.

W. A., Reveille, Nevada: An aplite with streaks and grains of iron oxide.

Tubalcain, San Francisco: Ferruginous shale containing considerable hematite.

J. M. M., Kemmers, Wyoming: Altered fine grained granite.

J. S., Bearmouth, Montana: No. 1, galena in quartz; No. 2, largely clay derived from a feldspathic rock.

C. d'A. I. L., Wallace, Idaho: No. 1, metamorphosed feldspar; No. 2, altered volcanic rock, too decomposed for determination.

E. S., New York, New York: Crude sample mixture of lime and sodium sulphate. The precipitated powder is purer sodium sulphate.

C. O. O., Boise, Idaho: No. 1, andesite; No. 2, quartz speckled with oxidized pyrite; No. 3, muscovite granite; No. 4, porous mass with limonite formed from the decomposition of pyrite.

Publications Received.

Any of the books noticed in these columns are for sale by, or can be procured from, the MINING AND SCIENTIFIC PRESS.

THE COST OF MINING. By J. R. Finlay. 8vo, pp. 415, index. McGraw-Hill Book Co., New York, 1909. Price $5.

This book is the result of a discussion started some six years ago by T. A. Rickard, and continued by W. R. Ingalls, J. R. Finlay, and others. Mr. Finlay's wide experience has enabled him to contribute to the discussion from a number of different points of view, and he has fittingly rounded up the whole discussion in the book before us. It is the first attempt in a large way to reduce the factor of cost to a common basis for coal, iron, copper, lead, zinc, gold, and silver. The attempt is ambitious, and in many places Mr. Finlay has had inadequate data. The results are none the less extremely interesting, and will be widely useful. It is a book to read and to keep for reference. We hope it may convince certain 'secretive persons' at whose secrets Mr. Finlay was obliged to 'rashly guess', that the publication of cost-data is helpful rather than the reverse. If it does this, and also attracts deserved attention to the value and nature of adequate reports, it will have accomplished much of what the Secretary of the Mining & Metallurgical Society is trying to do outside of as well as in the book.

In a work so large as this there are necessarily many things where there is room for difference of opinion. For example, in the discussion of labor costs in coal mining, I believe Mr. Finlay underestimates the artificial conditions fixed by railways and labor unions. Coal trade is, as he notes, competitive to an unusual degree. The selling price of any individual coal may, and often does, have no relation to natural costs. The market price at a competitive point being determined, the fixed charges known, the railway rate and mining rate are then adjusted so as to allow the coal to enter the market. As the railway rate goes up the pick rate goes down, as may be easily verified by an examination of rates in Illinois, for example. The artificial element, of course, is introduced in the arbitrary determination of what coals are to be allowed to enter a given market. This is practically determined by wage-agreements and traffic alliances. On the other hand, Mr. Finlay is entirely

right as to the present low profit in coal mining, though even here the high resulting profit to certain railway lines needs analysis, and in his conclusion that in this industry some form of monopoly will, despite the name, make for better results. His defense of smelting charges and smelter deductions appears less convincing, though it is the best defense yet made. Placing Leadville in the third class of lead ores, rather than the second, may also be questioned. It is difficult to see so great a difference between Leadville, as it has been recently, and Broken Hill. The camp is now sustained by low-grade zinc and iron ores. Much of the ore taken out within the last year depended on its 18% zinc-content for its chief value. Ore running as low as 13% zinc is now mined and shipped. However, it is captious to pick out minor points for difference when the book as a whole is one of whose value and wide usefulness there can be no question.

Ueber die Medizinischen Folgezustande der Katastrophe von Courrieres. By Edward Stierlin. Pamphlet. Pp. 188. Berlin, 1909. Royal Commission of Mines. Report of a committee appointed by the Royal Commission on Mines to enquire into the causes of and means of preventing accidents from falls of ground, underground haulage, and in shafts. Quarto. Pp. 182, ill. London, 1909. Second Report of the Royal Commission of Mines. Quarto. Pp. 298. London, 1909.

The careful attention now given to the study of mine accidents is well exemplified in the report listed above. In the first, Dr. Stierlin makes a careful medical study of the effects of the disaster. The Royal commission, on the other hand, is more concerned with causes and prevention, and what they have to say by no means concerns coal mines alone. The discussion of mining machinery, hoisting engines, hoisting ropes, speed-controlling devices, and cages is of general interest. The suggestions regarding the care of ropes and guides, of acceleration, of safety catches, of signalling devices and indicators, to mention only a few topics, are worthy of careful attention. It is unfortunate that much of the material is likely to be overlooked because of the form of the publication.

American Mining Congress. Report of Proceedings of the Twelfth Annual Session, Goldfield, Nevada, September 27 to October 2. Denver, 1909.

This volume of 460 pages includes an unusual number of papers of wide interest. A number of them have already been given notice in the Mining and Scientific Press, but we have by no means exhausted the list. The meeting was especially notable in the attention devoted to mining laws and public policy, and the papers on mine inspection, land laws, the Forest Service, and assessible mining shares, are particularly interesting. In addition there are descriptions of present conditions in Manhattan, Yerington, Bull Frog, Round Mountain, Good Springs, and other districts. The volume will be very useful and reflects great credit on the Congress.

Commercial Paragraphs.

The Arthur Koppel Co., announces that hereafter the name of the firm will be Orenstein-Arthur Koppel Co. The same interests control the business, and the policies of the old firm will be continued.

Peter E. Meagher, who is well known to the engineering and contracting firms, will sell the Wood rock drill in the vicinity of Duluth, Minn. The Wood Drill Works will carry a large stock of machines and repairs at Duluth for immediate shipment.

A. F. Blair, formerly chief engineer for the Northwestern Improvement Co., and O. S. Wakeling, formerly with Caldwell Bros., have formed a partnership under the name of Blair & Wakeling, for practice as mining and mechanical engineers. The offices of the new concerns are at 616-617 Mutual Life Bdg., Seattle, Washington. It has the northwestern agency for the Philips Mine & Mill Supply Co., Pittsburg, Pennsylvania.

The Primos Chemical Co., Philadelphia, is installing at its property at Newmire, San Miguel county, Colorado, a Hendryx combination agitator and filter for treatment of vanadium ores. The equipment is furnished by the Hendryx Cyanide Machinery Co., of Denver.

The Smith-Booth-Usher Co., Los Angeles, California, are lessees of the patent on the International-Amet oil-gas producer and have secured the right to manufacture and sell the device. They advise that this producer has been in practically continuous operation in two large plants for about three years, and has proved all the claims made for it. The above company is now ready to estimate upon the installation of oil-gas producer plants.

Special Risdon Dredge Buckets.

The accompanying illustration gives an excellent view of a recently installed bucket-line on the Gold Run dredge at Oroville. It represents the best modern practice. The buckets are made of cast manganese steel, and during continual service for six months they have not worn at any point more than $^1/_{16}$ in. They differ from other buckets of the close-connected type in having the bottom made separately from the links, so that when the links become worn they may be renewed without discarding the heavy bottom. This bottom is made of cast steel, with a manganese steel lip. The links also are of manganese steel. The pin is fixed, but has a square head which can be turned, thus lengthening its time of service. The pin is made of bushed manganese steel. So far as the design of the bucket is concerned the purpose has been to secure a form that will have a lower digging point, thus reducing the digging strain, while the capacity of the bucket is maintained by giving it somewhat greater width. The effort has been to embody in this bucket the desirable features of both the open and close-connected types.

Risdon Dredge Buckets.

Catalogues Received.

The Denver Fire Clay Co., Denver, Colorado. 'The Case Hydro-Carbon Burner'. A concise description of this new hydro-carbon burner. Illustrated. 3½ by 6 in. 4 pages.

The Jeffrey Mfg. Co., Columbus, Ohio. Booklet No. 33. 'Conveyers'. Illustrated. 3½ by 6 in. 24 pages. Booklet No. 34. 'Elevator Buckets'. Illustrated. 3½ by 6 in. 24 pages.

Murray Iron Works Co., Burlington, Iowa. Catalogue No. 65. 'Corliss Engines and High-Pressure Boilers'. An unusually handsome and complete catalogue. Illustrated. 8 by 11 inches. 84 pages.

EDITORIAL.

COPPER is not the only thing being merged. *Industrial Engineering* and *The Engineering Digest* have joined forces and will be published hereafter at New York under the editorship of Mr. Robert Thurston Kent, with whom will be associated Mr. William Kent.

AN OFFER of fifty cents per ton royalty on certain Alaskan coal lands has been made to the Government. It is coupled with provisions as to railway rights and coal contracts which, while they may afford no reason for rejecting the proposal, do take it out from the class of royalties proper.

WITH the January number *The Mining Magazine* began a second volume. A general international review of mining has long been needed as is proved by the instant success of our London contemporary. Necessarily in such a publication reviews, digests, editorial, and special correspondence take first place, but we are glad to note that these are splendidly supplemented by high-class technical articles. Mr. W. J. Sharwood's studies of the 'Measurement of Pulp and Tailing' are particularly welcome.

CONSERVATION legislation makes slow progress at Washington. The Senate Committee, however, has agreed to recommend a bill giving the President unequivocal rights to withdraw public lands for forestry, water-power sites, irrigation, classification, and other public purposes. Such withdrawals are to hold till revoked by the President or by Congress and are to be reported at the beginning of each regular session of Congress. W. B. Heyburn, of Idaho, and C. D. Clark, of Wyoming, lead the opposition.

MINOR amendments were made to the Bureau of Mines bill in the House at Washington. The only one worthy of comment is that reducing the salary which it is proposed to pay the Commissioner of Mines to $5000 per year from $6000, the amount paid the Director of the Geological Survey, the Director of the Census, Superintendent of the Coast and Geodetic Survey, and others. This is an excellent commentary on Congressional opinion as to the importance of mining engineers. Civil engineers, and others on the Panama Canal commission are paid $10,000 to $15,000 per year and furnished quarters. The lately ventilated Immigration Commission furnished several favorites with $10,000 jobs, and in one case is reported to pay $7500 to a man who simultaneously draws $10,000 from other sources. In the light of these facts the argument that the Commissioner of Mines should not be paid more than the

heads of numerous other Government Bureaus loses force. It will be unfortunate if a Commissioner of Mines is appointed who either must supplement his official salary by work for private companies or must rely upon personal income which in such a case would almost inevitably be drawn from mining investments. A man competent to fill the position is worth a much better salary than the Government is likely to pay in any event, but that is no reason for cheese-paring to the point of niggardliness. The matter is now in the hands of the Senate.

ILLINOIS has taken the lead in a formal resolution adopted by the General Assembly endorsing the bill introduced in Congress by Mr. Frederick Lundin and proposing a committee to investigate systems of old age pensions. Whatever may be finally determined as to the best and most economical means of providing for old age, it is certainly wise to start fore-armed with complete information regarding existing systems of insurance, annuities, and pensions, and their operation. Money can be well spent in such an investigation. There is a growing belief that adequate measures must be provided, in order to insure continued industrial prosperity.

PHILIPPINE gold dredging has been attracting much attention this year and we are glad to present on another page some details regarding the work at Paracale. In Manila there is almost a boom in the shares of dredging companies, those of the Paracale Gold and the Stanley-Paracale having both gone to premium. The two companies have done well and while the operations are on a small scale the richness of the ground has enabled them to make good returns. The Philippines Gold Dredging Company has acquired ground in the district and is preparing to begin. The Paracale Extension Gold Dredging Company, Limited, has taken options on 230 acres in the district and is planning to put two dredges at work, the first, by August this year. The dredge master, Mr. William Kane, estimates profits on a basis of a gold content of ₱1.05 per yard through a thickness of 26 feet, with a saving of 75 per cent, at a cost of 5½ cents per yard. We suspect that this cost is too low. While no figures based on Philippine experience are available it may be noted that Mr. Kane, with the Paracale Gold Dredging Company's boat, was only able to achieve 15 per cent of the digging capacity, and stoppages are a most important cause of mounting costs. In a group of more than a dozen dredges working in California in 1908, only three worked at costs as low as those estimated by Mr. Kane, and these had actual digging records for the year of 2824, 3138, 1406 cubic yards per day. Capacity is, of course, not the only factor in dredging, but is a large one since with buckets equally well adapted to particular ground the cost decreases in inverse proportion to the size of the bucket. The 5 cubic foot buckets planned are of only moderate size and do not in themselves warrant expectations of particularly low costs. Except in the possible matter of labor costs it is difficult to see where dredging in the Philippines will be cheaper than in California, and labor constitutes normally but 20 to 25 per cent of the total dredging expense. The richness of the Paracale gravel, however, assures returns at costs which would be prohibitive elsewhere.

SPEED MANIA constantly claims its tribute of human life. The latest victims were at Kelvin, Arizona, where a motor car containing seven men was blown to pieces by a delayed blast in a railway cut. The men killed were W. H. Freeland, Denver, Colorado; Walter Crentz, Berkeley, California; R. P. Coleman, Salt Lake, Utah; J. H. Joyce, Lewistown, Maine; J. C. Griffin, Phoenix, Arizona; A. S. Bieber, Cleveland, Ohio; H. H. Lyle, Los Angeles, California. With the exception of Mr. Lyle these were all mining engineers working for the Ray Consolidated Mining Company. They were young men, at the threshold of their professional career, and their death emphasizes the fact that of all the wastes in our industrial life that of the lives of talented and prepared young men is the one we can least afford.

Patents in Australia and Elsewhere.

In Australia the Federal Parliament has just passed a law, modeled on the English statute and designed to force the manufacture within the Commonwealth of all goods which are patented under the local laws. By its terms foreign patentees must arrange for local factories or else, after due notice, anyone will be permitted to manufacture the goods without regard to the patents. While this legislation, at first glance, seems harsh and likely to provoke retaliation, there is an essential element of fairness in it. *The Australian Mining Standard* quotes the Attorney-General as announcing the principle that "if a man secures a particular monopoly he must discharge his obligation in regard to it here." There can be no question as to the soundness of the principle, but in the past the requirements have been thought to have been met by the payment of customs duties on the imported goods. Australia, however, needs population, and local manufacturers are well calculated to attract working men. Under these circumstances Parliament falls back on the inherent right to nominate the terms upon which patents will be granted. In practice the difficulties are not likely to be great. Where there is a large demand local plants will be established, and where the demand is small, licensed manufactories will answer the purpose. In any event the high cost of manufacture will prohibit competition in neutral territory, and the extra burden on goods sold at home will be as cheerfully paid by the Australians as we pay the extra cost of 'protected' articles in America.

The principle announced by the Attorney-General calls attention to another phase of the matter of widespread importance, namely, the purchase of patents for the purpose of suppressing them. This is a general practice and in some measure defeats the very purpose of the patent laws, which are designed to stimulate invention in order that the public may realize the benefit of the improvements. The provision of temporary protection to the invention is incidental merely to the larger purpose, and while there often are, from the point of view of the manufacturer, excellent business reasons for suppressing

a rival patent, the public suffers deprivation of benefits in order that old machinery may be worn out. We have had in America repeated instances of this in metallurgical as well as in other industries. Patenting an article imposes obligations as well as grants rights, and some way should be found to meet the case. In Australia it seems that "the inventor, as a rule, is such a luckless wight that his case can scarcely be made worse," and this cynical comment by the *Standard* might be equally well applied to many American inventors. Our patent laws and the system of their interpretation and administration, are notoriously in need of revision. The examiners at Washington have no laboratory facilities, and must of necessity rely upon literature in examining claims. This leads to magnifying technicalities, and practically the man who gets a patent buys little more than the right to defend himself in court. This is not such a valuable right when it is remembered that a large part of a patent attorney's business is concerned with the ways and means of 'getting around' a patent, and when, too, cases may be originated in any of the United States District Courts. Appeal from an adverse decision need only be considered by the Supreme Court at its option, and in practice is an inadequate remedy for the contradictory decisions of the District judges.

The Copper Game Again.

Discussion concerning the merger of Nevada Consolidated and Utah Copper continues, but the situation is still far from clear. We commented upon the matter in our issue of January 29, and so far have nothing to retract. From the meagre information given out it appears that the exchange of stock would be in the interest of the Utah Copper Company, without corresponding benefits to the Nevada Consolidated. Before our criticism shall prove to have been in error, conditions must come to light that will give faith in the philanthropy of capitalists. After that we shall look for the millenium. The demand for facts concerning ore reserves and costs of production has evoked no satisfactory response. Circular letters have been issued by Mr. Charles M. MacNeill, president of the Utah Copper Company, and by Mr. Pope Yeatman, consulting engineer for the Nevada Consolidated, transmitted under date of January 31 to the Nevada Consolidated stockholders by Mr. W. E. Bennett, secretary of the latter corporation. In none of these communications are the vital facts given. So confused is the whole situation that a Chicago stockholder in Utah Copper is protesting at the exchange as unfair to Utah, which constitutes a minority report. In the public letters favoring the deal there is no argument, no reasoning from fundamental data; only expressions of favorable opinion, suggestive of mere deference to the wills of controlling minds. They were followed by another letter from Mr. James Phillips, Jr., vigorously attacking the scheme, and incidentally throwing into strong relief some of the evils which befall the great productive enterprises of the country when they become tributary to Wall Street. He points out that one result of the recent merger of Utah Copper with Boston Consolidated was the payment of legal toll amounting to $775,000. This vast sum is abstracted for the paltry service of arranging the details and effecting the transfer. It is a burden which rests heavily upon the enterprise, and which will bear proportionately upon the Nevada Consolidated if that company should be merged with Utah Copper. Mr. Phillips pertinently asks whether the fee for effecting the larger combination will be at the same rate. That would involve a payment of $7,750,000, sufficient to finance a copper mine of the first magnitude. Mr. Phillips also asks whether it be advisable to link fortunes with a company which is defendant in litigation involving millions of dollars; whether the smelter contracts with the Utah Copper are sufficiently understood; and whether it be warrantable to submit to the drain of existing transportation contracts, and the need of betterments at mines and mills, which collectively involve the absorption of large sums of money. The Nevada Consolidated will also need to enlarge its operations, and since no lessening of costs can occur from the merging of the two concerns it is not clear why each should not independently work out its own salvation, if each can, as its friends vociferously declare, confer such benefits upon the other.

These queries emphasize the lack of information given to the stockholders. The truth is that the merger is put through in order to secure control for a certain group of financiers rather than for any reasons based on increased economy of production. The attention of the public has been drawn away from the physical features to the stock-market possibilities of the situation. Meanwhile manipulators are seeking to anticipate the profits through a little juggling with 'securities', while the rank and file are told to treat stocks in a mining enterprise as if they were gilt-edge Government or municipal bonds.

The financing of mining properties through Wall Street is an evil which should be discouraged by all who have the welfare of the mineral industry at heart. It means the division not only of profits, but of original capital, with those who contribute nothing. The most expensive part of the equipment of a mining company launched through Wall Street agencies is often the underwriting plant. Direct appeal to the public for capital on the other hand leaves the stockholders in control of the assets. High-finance underwriting has become a guarantee of devious stock-jobbing methods past finding out by the man in the street, rather than of sound economic bases for industry. Instead of giving confidence of financial safety, the system has been converted into a trap for the unwary. Ideally, underwriting should provide safe utilization of capital and assure the investor that the project has been adequately investigated. Because it is supposed to do so the public has heretofore blindly followed the lead of the underwriters, trusting in their reputation. The merging of great corporations should prove a means to greater economy and efficiency in operation. There is a sound basis for the system, and these instruments of modern finance have their origin in the need of regulators of industry, but as yet we have found no reliable method of regulating the regulator.

Matte Smelting at Denver.

Written for the MINING AND SCIENTIFIC PRESS
By H. FOSTER BAIN.

That smelting in Colorado as a business is just now in unstable equilibrium is well known. The review of the year contributed by P. H. Argall to the January 1 issue of the MINING AND SCIENTIFIC PRESS presents the case as a whole. The simultaneous closing, however, of the Argo smelter, the starting of the Modern, and the projected re-opening of the Golden plant, all of which are designed to treat the same general class of ores, warrants special attention.

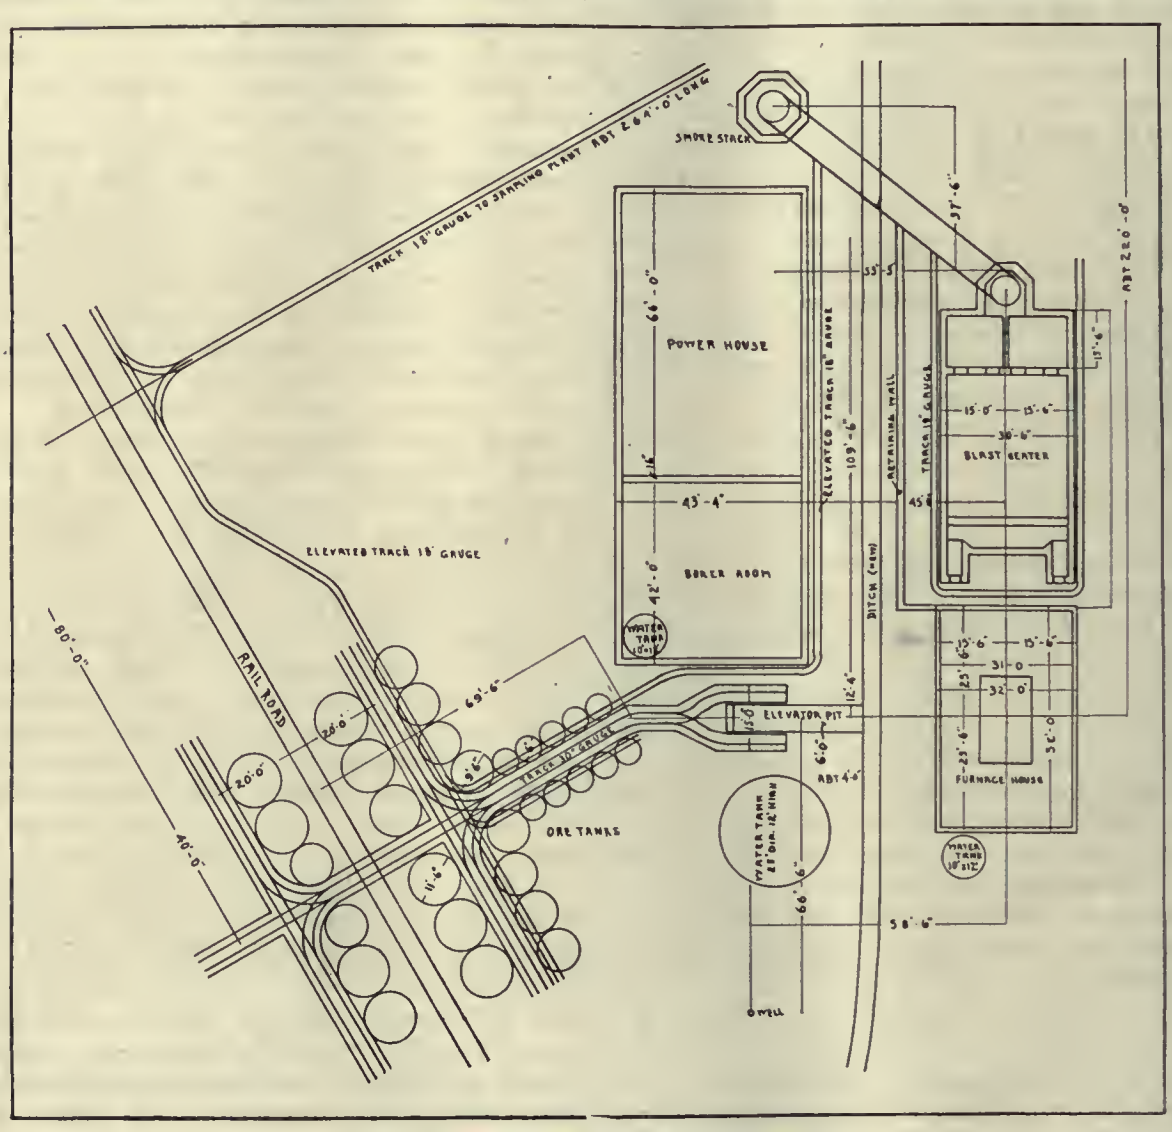

Fig. 1. Ground Plan of the Modern Smelter.

There have been many attempts at pyrite and matte smelting in Colorado. Perhaps the most ambitious was that of certain Iowa capitalists who built the Rocky Mountain plant at Florence to treat Cripple Creek ores. The furnace cost $250,000 and ran but a short time. It has stood idle about seven years and was sold last fall to satisfy a judgment for $78,130. A furnace at Leadville, as Mr. Argall has related, was taken over by the American Smelting & Refining Co. and closed for reasons other than its technical performance. Small furnaces near Ward, Buena Vista, and other points have run for various periods, and at Golden, as shown later, an excellent plant made a fairly long campaign. Only one company, however, depending on copper as a collector for gold and silver, has been successful through a long period. This was the pioneer smelting company of the State, the Boston & Colorado, which began smelting at Black Hawk in Gilpin county in 1867. In the spring of that year the company was organized by a number of capitalists of Boston and Providence, who subscribed $275,000 to build the first smelter in the West, an undertaking not unnaturally regarded then as somewhat hazardous. James W. Converse became president and J. W. Merrill treasurer of the new company, positions which they held for many years. The initiative for the enterprise came from N. P. Hill, who at that time had recently been professor of chemistry in Brown University. Later he became capitalist, United States Senator, newspaper owner, and in many ways one of the foremost and most influential men in the West. When work on the new plant began there were only three old stamp-mills running in Gilpin county. The processes in use were extremely wasteful, there was no market whatever for refractory ores, the miners were discouraged, and many of them were moving away. Mr. Hill's attention was first attracted to Gilpin county in 1864. The need of better methods strongly impressed him. He returned the next year and studied the matter on the ground. Later he visited Europe and learned what was possible at

foreign smelters. Finally he came to Gilpin county with metallurgists from New York and Wales and a carefully selected lot of 72 tons of ore was shipped to Vivian & Sons at Swansea for test. While, therefore, the enterprise started in 1867 was new and properly to be considered venturesome, it was founded on ample study and carefully matured plans. How much this meant, is reflected in the long and successful career of the company, with its many technical and financial triumphs.

Treatment began in January 1868 with one smelting and one calcining furnace. At first Herman Beeger was the metallurgist, but shortly after Richard Pearce joined Mr. Hill in the enterprise, and that partnership which proved so fruitful of results and was to last so long, began. Business rapidly increased, and three smelting and seven calcining furnaces were added. In 1873 branch works were established at Alma, in Park county. For a time the matte was shipped to Swansea for refining, being hauled across the plains by wagon and sent down the Mississippi to New Orleans. In those days it took six months to get a settlement, and it was not always satisfactory then. Brick used at the furnace came from Scotland and cost $1 each. Castings were 20c. per pound, and other costs in proportion. Necessarily rates were high, and $35 per ton was charged on some ores. The new works were profitable, and in 1870 the company began treating its own matte. For a time a refinery was maintained in Boston, but eventually the works were concentrated at Argo, a suburb of Denver, when in 1879 a new plant, including a refinery, was built. Smelting has been carried on here continuously ever since, and for many years the company paid quarterly dividends, with a comfortable extra distribution at the end of the year. The Argo works at one time included five furnaces. The number working was some time ago reduced to two, and later to one, which has since been busy cleaning up preparatory to dismantling the plant. The refinery was destroyed by fire in 1906 and was never re-built. After its destruction the matte made at Argo was handled by the American Smelting & Refining Company.

The Argo plant has been notable for its technical as well as business triumphs. It was here that Richard Pearce developed the smelting of copper ore in reverberatories, gradually working up from 5-ton to 100-ton furnaces. Here, to, the Ziervogel process was early applied and the 'Pearce process' of refining was developed. The story of the latter has been told so recently and so well by Harold Pearce that no more than a reference is needed.* Some of the earliest work, too, was done here in the utilization of waste heat. So important were the economies introduced from time to time that the early smelting rates were gradually reduced until in the last year the average rate was $3 per ton. When smelting began at Black Hawk, ores carrying 15% copper were abundant. These were gradually worked up, and as the mines became deeper the percentage of copper in the ore fell. Concentrates from Gilpin and Clear Creek counties now contain about 2% copper. Some highly silicious ore, carrying 3 to 4% copper, is shipped direct, but in the immediate territory there is an undeniable shortage in copper-bearing ore. For a time the Argo plant drew heavily on adjacent States. A little ore came from the Black Hills. More

Fig. 2. General View of the Golden, Colorado, Plant of the North American Smelter & Mines Company.

*Bull. Amer. Inst. Min. Eng., No. 26, Feb. 1909.

was obtained in Wyoming and New Mexico, and Arizona and Utah each contributed. Butte never shipped much ore to this plant, though some came from the Trenton, and the Gagnon mine was at one time controlled by the Boston & Colorado company. As emphasis, however, came to be placed on the copper rather than the gold content, it became more economical to smelt near the mines, and other smelting centres prospered at the expense of Denver. The final closing of the smelter is due to the change in conditions of ore supply rather than to any failure in technical or business direction. The immediate occasion was the necessity of making expensive general repairs and investing considerable sums if the new conditions were to be met. There are now some 300 stockholders. The youngest of the original stockholders is 72 years old. The younger generation is interested in other things, and on the whole it seemed better to close out at a profit and look to re-investment in other business.

At the same time that the Argo was planning to go out of business a new smelter was being built a short distance away at Utah Junction. This, the Modern smelter, is situated on a tract of 48 acres reached by the Denver, Northwestern & Pacific, the Chicago, Burlington & Quincy, and both the standard and the narrow-gauge lines of the Colorado & Southern railway. The plant was visited in August and went into blast in October 1909. No expense was spared to make it automatic and economical. Steel and concrete were employed throughout, 3000 bbl. of Ideal cement having been used. The general arrangement of the buildings and tracks is shown in the accompanying sketch (Fig. 1). The compactness and convenience of the works is to be noted.

Ore is delivered by private switch. The scales have a capacity of 200,000 lb., and are self-registering. They were built by the Strait Scale Co. of Kansas City, and are set high from the ground so as to permit easy inspection. Three-rail tracks are carried so that either standard or narrow-gauge cars may be handled. These have been made the master scales for the district by the Western Railway Weighing Association. The ore-bins are below the railway tracks. They are round steel bins set on concrete and are made with hopper bottoms. The total bin-capacity is 30,000 tons. The bins deliver to the level on which the charging car runs. As ore is shoveled from the cars to the bins every fifth shovelful is thrown into the sample car which runs on the same level as the ore cars. The sample car is trammed to the sampling works, where by means of crushers, rolls, mixers, and Dewey samplers, an automatic sample amounting to $^1/_{320}$ is taken and sent to the bucking room. In considering these arrangements it should be remembered that it is only expected to handle low-grade ores at this plant. Automatic sampling from the first is therefore hardly called for.

The charging car is also a weighing car. It was manufactured by the Strait Scale Co., and carries seven weigh-beams. These may be set and locked by the chemist, after which the workman needs only to draw in turn from each bin enough to balance the beams as indicated. There is no mixing platform, but the ore is dumped from this car into a hopper from which it feeds into a bucket conveyor which elevates it to the charging bin. This conveyor, built by the Webster Mfg. Co., handles 40 tons per hour with a 7½-hp. General Electric motor. The ore dumps from the head of the conveyor into a charging bin at the side of the furnace. Three-fifths of the charge falls direct from this bin into the furnace, while the remainder is handled by charging barrows dumping on the other side of the furnace. In this way the advantages of semi-automatic charging are realized, while regular distribution of the feed is obtained through the use of the barrows.

The furnace is a McDonald, 180 by 38 in. built by the Colorado Iron Works. The bustle pipe is made 42 in. diam. so as to permit of lengthening the furnace. The blast is delivered through a stove containing 144 vertical cast-iron pipes 12 in. diam. and 10 ft. long. These stand in 14 compartments which collectively form a dust-chamber between the down-take and the stack. The outgoing gases therefore give up their heat to the incoming blast at the same time that the flue-dust is deposited. A by-pass is provided so that the dust-chambers may be cleaned without stopping. It is expected that the blast coming from the stove will have a temperature of about 650°F. This will be then raised by means of 'Western' furnaces automatically burning lignite, to 950°F. The ashes from here, as well as from the steam-plant, are washed away by means of a jet of water. The forehearth is 5 by 9 ft.; the slag is granulated, and the matte is handled by conveyor to the cars. The stack is 135 ft. high, 14 ft. diam. at the base, and 7 at the top.

The secondary features of the plant have been well looked after. An independent water-supply has been secured by means of an artesian well 420 ft. deep, and a 48,000-gal. storage tank provided. The whole place is lighted by electricity, the wires carried in pipes to the different parts of the plant, and there are even pipes carrying cooled drinking water. The engine-house is built of concrete blocks. Lignite is burned in Western furnaces under Kennicut boilers furnishing steam to a 210-hp. high-speed Corliss engine, made by the H. M. Strait Mfg. Co. There are two Piqua blowing engines delivering 10,000 cu. ft. each and taking air from outside through a screened tunnel. The dynamo for lighting is a 150-kw. General Electric. So thoroughly have the automatic features of the plant been worked out that it is expected that 80 men will be able to handle 300 tons per day. Every preparation has been made for working at the lowest possible treatment charge. The company owning the smelter is a close corporation of Chicago and New Orleans men. There are some twenty stockholders only, and little has been said as to the plans and purposes. They are reputed to be abundantly able, financially, to carry through any plans they may make. The plant was paid for with cash, bills discounted, and a start made with no debts. The corporation is organized under the laws of Colorado with a capital of $2,500,000. J. G. Powell is president, W. A. Patterson, secretary-treasurer, and H. C. Reno, vice-president and general manager. The plant will treat low-grade 'Gilpin county' ores especially,

but will handle silicious and copper ores from as wide an area as possible. An initial supply of copper ore has been obtained from Wyoming. Morrison limestone and Colorado coke are used. Ores are sampled at the plant and the benefit of the sampling charges saved given to the mines.

The third plant to be considered is the smelter at Golden, about 16 miles west of Denver at the mouth of Clear Creek canyon. This was purchased last fall by the North American Smelter & Mines Co. from the Clear Creek Mining & Reduction Co. This smelter was erected some ten years ago by F. R. Carpenter for a Detroit corporation of which Berry Brothers were the principal owners. The plant was designed to handle 500 tons per day of Gilpin county ore according to plans developed by Mr. Carpenter in the course of work at Rapid City in the Black Hills. The smelter ran for several years and handled a considerable amount of low-grade ore. The company owning it controlled the Saratoga mine and shipped heavily from this property as well as bought freely in the open market. A minimum rate of $3 was established, and there was strong competition for ore between the Clear Creek M. & R. Co. and the A. S. & R. Eventually the Golden smelter closed down and it has stood idle ever since. The company which has just taken it over is a $2,000,000 corporation, with G. L. Irvine of Chicago president, H. A. Riedel of Denver vice-president and general manager, and A. J. Throne of Louisiana second vice-president. Certain Pittsburg people are also interested. The same people have purchased mines at Idaho Springs, including the Banner Consolidated, Centurion, Donaldson, and Champion-Comstock groups. These are tributary to the Rockford tunnel which opens the veins at depths of 500 to 2000 ft. on the dip. The mines have been heavy producers in the past, and it is expected that systematic development will again place them among the leading shippers. Frank H. Nye, a former State Mine Inspector, has been placed in charge of the mines and of the Kilton sampling plant at Idaho Springs, which has also been purchased. J. H. Robeson has been made consulting engineer, and will plan the mine development. The smelter is being overhauled and $25,000 is being spent on repairs and extensions. A Vivian reverberatory is to be added and connection made with the Central Colorado Power Co.'s lines. The company already owns lime quarries, the tracks to which are being put into condition. An early start is promised.

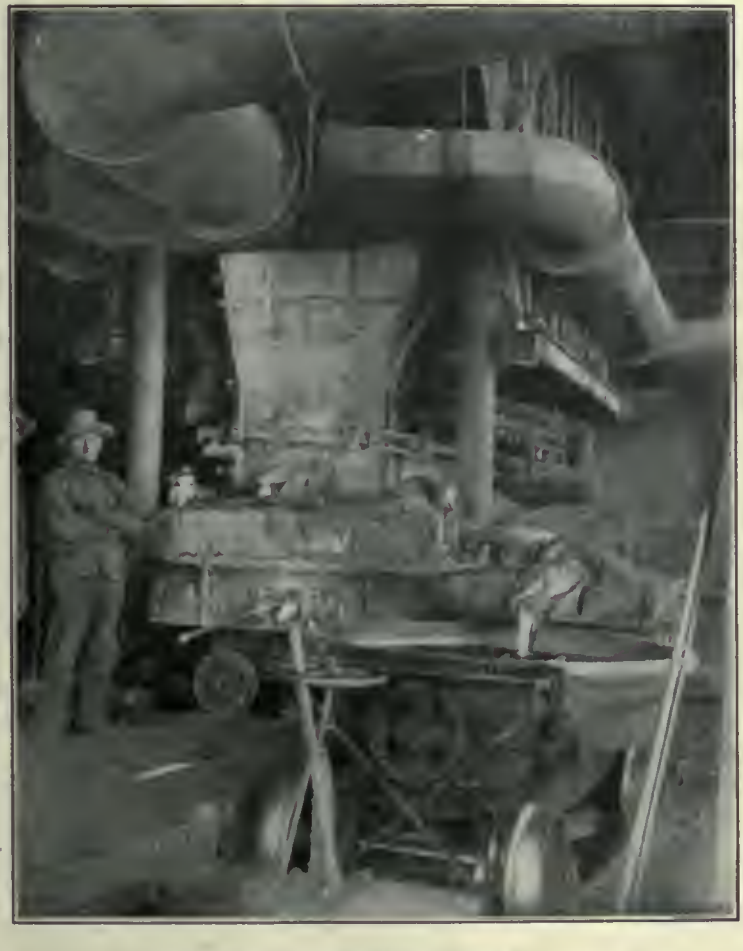

Fig. 3. Furnace and Forehearth at the Golden, Colorado, Plant.

These various changes focus sharp attention upon the matter of ore supply. The Argo went out of blast because of the difficulty of obtaining a sufficient supply of copper-bearing ore. The Modern at the same time begins work depending mainly upon the open market. The North American is planning to begin, but is evidently counting largely on its own mines for ore. In the meantime the A. S. & R. furnaces are running at about half capacity, although this company has contracts with the main producers and has a virtual monopoly of the market. Whether lower rates, if put in, will bring out enough ore to keep all the furnaces busy is uncertain. When the Golden smelter was running before, nearly everything available was shipped and many old stopes were emptied. So much ore came out that the Argo at one time had more than a year's supply ahead. Yet in the end there was not enough ore at a payable rate to keep the plants running. A similar cut in rates now would find fewer old stopes to empty. On the other hand, the Newhouse and other tunnels are farther into the mountains, and the old mines are being drained to greater depths. The introduction of electric power has made possible the working of many properties which could not show a profit under old conditions, and there are undoubtedly large quantities of ore remaining to be mined, if costs can be sufficiently reduced. There is likely, however, to be shortage in copper ore, and it is not apparent from what source this deficiency is to be made good. Failure in the past does not necessarily predicate failure in the future, and at least I am glad to wish the new companies as long and as honorable careers as that of the Boston & Colorado. The Modern starts with an excellent plant and low working costs. It is stated that 4% less coke is used than at any competing plant, and clean slags running 8% higher in silica are made from charges containing only 0.5% copper. The initial difficulties seem to have been overcome, and engineers will watch with great interest these efforts to make a market for ores which heretofore have required to be concentrated.

Gold Mines of Tibet.

Written for the Mining and Scientific Press
By Alexander Del Mar.

The principal and almost the only important gold mines of the higher areas in Asia alluded to by classical writers, were situated in a northeasterly direction from Greece and Asia Minor, in what were then cold climates. But as the period when these mines were worked is not given, and as Herodotus and other writers on the subject may have quoted from accounts which were ancient even in their times, it cannot be assumed that such climatic conditions were the same when the mines were productive. This subject has an important bearing upon the location of the mines and what was found in them.

If, following the example of Lock, in his work on 'Gold', a map of Asia is marked with all the gold mines on that continent known to classical antiquity, then, going eastward, they will appear first in Turkestan, in the upper valleys of the Amu Daria (Oxus) near Bokhara; and secondly and chiefly, in the mountains of Tibet, long. 82 to 87°E. from Greenwich. Says Lock (p. 314): "Bokhara and Tibet are especially renowned for their productiveness." Both of these groups of ancient mines lie between parallels 30 and 40, but with this difference; the first group is situated at a comparatively low elevation and in a warm climate; while the second is at a high elevation, in what is now a cold climate. It is evident that the principal mines, those, for example, which are alluded to by Herodotus, Ctesias, and Megasthenes, were in Tibet.

Here again is another difficulty. Tibet at the present time does not extend northward beyond the desert of Gobi, while in the times alluded to by Herodotus it extended to the Polar sea and included all that is now known as Siberia. Although the Tibetan mines were worked possibly as early as the twentieth century B. C., it does not appear that they were the oldest gold mines in the Orient, because it is likely that the gold mines of China and perhaps also some of the mines in the Punjab, Naghpur, Orissa, Mysore, and Malabar, were older, or as old. The most ancient ones, as well as the most important which were known to classical writers, were in Tibet.

In the same chapter in which Strabo repeats the observations of Onesicritus concerning the manner of appointing the Grand Lama of Tibet, he informs us that when Alexander the Great conducted his expedition to the confines of that country, he had a mining advisor with him named Gorgus, who reported that "valuable mines, both of gold and silver, were situated not far off among the mountains"; from which it is evident that the Macedonian hero had something more practical in view than visiting the 'birth-place of Bacchus'. Between the researches of Gorgus and those of Huien Tsiang, Marco Polo, and the Jesuit missionaries, who say little about the matter, no information was permitted to reach the outer world concerning the mines of Tibet. The gold of Tibet, as we shall see further on, is "sacred to the Grand Lama"; and for this, perhaps as much as for any other reason, the country has ever been interdict to the rest of the world. The British, however, have seized every occasion to break down this barrier. Captain Turner (1793-1806) reported gold-dust in nearly all the streams crossed in his journey to and from Lhasa. Moorcroft (1816) reported on the gold mines of Little Tibet near Mehal, at the head-waters of the Sutlej, where numerous excavations at various levels attested long continued and probably ancient workings. Lieut. Strachey (1846), another traveler in this region, found that the principal gold mines, Sar-Chaka, were farmed by a sar-pun (gold mines overseer), who paid to the Sacred Treasury of Lhasa $8500 per annum and had 170 miners at work. The gold was in quartz, and mining supplies were brought from Pruang, as the country was barren of agriculture. The metal was sometimes found in large nuggets or masses, the Lama of Gangri showing one weighing 2 lb. 1 oz. As a rule, the Lamas, after claiming the big pieces, pretended to have buried them again, as 'spiritually dangerous'. Such claims and pretensions could hardly have had weight with mine-farmers; and must therefore be limited in their application to individual and ignorant miners. Similar claims of 'sacred gold' appear in the ancient Code of Manou. Captain Montgomerie (1865-7) reported a gold mine at Toti-phu, four miles north of Lhasa, others at Debang and Ramoche, worked by the priests, who affected to re-plant all their large finds, but upon another pretence; that of their power to germinate auriferous offspring! Montgomerie also reported a gold mine six weeks journey northeast from Lhasa, at a place called Sar-ka, or Thok, where gold was obtained in large quantities. 'Sar' is said to be the Tibetan word for gold, and 'thok', for a mine.

Col. Walker (1867-8) appears to have employed for similar researches an Indian pundit, who visited an extensive placer mine at Thok-Jalong (altitude 16,330 ft. above the sea), where the yield was large and the nuggets often heavy, one weighing 75 tolas, or about two pounds. The diggings were farmed out by the Sar-pun, who allowed each miner a small area, for which he paid one sar-shoo, about two-fifths of an ounce, per annum; the Sar-pun himself being watched very closely by the Lhasa authorities. The cold was intense and the miners lived in pits seven or eight feet below the surface of the ground and roofed like tents. Of these habitations there were 600, which, at an average of ten miners to each, would make the whole number about 6000. On the way from Rudok to Thok-Jalong the pundit heard minute descriptions of no less than seven different goldfields, namely, Sar-kong, Dikla, Ragyok, Thasang, Maroobhoob, Gunjee, and Nianmo, besides Sar-lung and Jalong, which he actually visited, and Phaiyu-Pooyu, of which he only heard. Upon reading these reports Sir Henry Rawlinson wrote as follows in the Indian Antiquary (iv, 225): "Now then, for the first time, we have an explanation of the circumstances under which so large a quantity of gold is, as is well known to be the case, exported to the West from Khotan and finds its way into India from Tibet; and it is probable that the search for gold in this region has been going on from a remote an-

tiquity; since no one can read the ex-pundit's account of Tibetan miners living in tents some seven or eight feet below the surface of the ground and collecting the excavated earth in heaps previous to washing the gold out of this soil, without being reminded of the description which Herodotus gives."

Cooper (1870) found at one day's journey from Lityang, on the road to the Taso mountains, numerous streams with sands containing gold, which the hoofs of his cattle occasionally turned up, but which he was warned not to gather, because "gold, like all else of a yellow color, was sacred to the Grand Lama." The yellow color, however, is not Lamaic, but Chinese, the Lamaic color being red.

Capt. Trotter (1877), in giving an account of the pundit's second journey, which was from Ladak to Lhasa, visited the goldfields of Thok-Daurakpa, where the miners' habitations, like those described on his previous journey, called phukpa, were 32 in number and contained from 5 to 25 miners each. Some of the diggers were from Shigatze. There was no water at the mines, and it had to be brought in on donkey-back from a distance. He mentioned large tracts of auriferous lands elsewhere, which could not be worked for lack of water.

Besides the gold mines within the present boundaries of Tibet, Lock describes enormous auriferous areas in Siberia, Manchuria, Nepaul, and Bhutan, which formerly belonged to Tibet, and in some of which provinces traces have been found of ancient workings. He adds that the gold-washers of Nepaul (Tharus), the Duars of Bhutan, and the Mechs and Kacharis of Assam, are evidently of Mongolian origin; that they use mercury for amalgamation; and that such use among Mongolian miners appears to be ancient. The Siamese also claim a Mongolian origin, and believe that the use of mercury in amalgamation is ancient, an inference that they base upon the known antiquity of their cinnabar mines. The present exports from Khotan and Gar-thok evidently form but a small part of the entire production. As to the yield in ancient times, there are no data. We can only conjecture that, like all placer mining—for the mines alluded to were placers—the yield was irregular, depending largely upon the supply of water for washing the gravel, and this again upon the length of the warm season, which, in the northern and elevated regions of Tibet, as we know from Alaskan experience, must have been comparatively brief. Upon the hypothesis that the number of mines and miners worked and employed in ancient times was no less than at present, it may be roughly computed that the annual yield fell within fifty thousand pounds sterling in value, or a quarter of a million dollars.

In 1872 a collection, consisting of 464 bronze coins acquired in China by the Rev. Justus Doolittle, an American missionary at Foo Chow, passed into the hands of Horace Fletcher, of San Francisco, and by him was submitted to my examination. The coins are fully described in my 'History of Money in Ancient States', a work now out of print. Some of the oldest and most curious of these coins were also lithographed and published in a pamphlet on 'The History of Money in China', by Brodie & Co., of San Francisco. The most ancient coin of this collection was of the Emperor Sung, 2257 B. C. It was of bell shape and weighed 325 grains. The inscription, in ancient Chinese, was Taung king hou; that is, as read by experts in China. As read by H. T. Kuen, the Chinese Vice-Consul at San Francisco, an American academician, it was Tong king fo, both of which he translated as, 'for gold good', or 'good for gold'.

Despite the limitations which the Greek authorities affix to the antiquity of money, I am confident that this is a genuine coin; and therefore that not only was bronze money employed in China at the remote period of Sung, but also that it had been preceded in point of time by the use of gold for money, either in the form of coins or bullion. Assuming this to have been the case, it follows that gold mines must have previously been worked in China, or in some country upon which China could depend for such supplies of the precious metal as were sufficiently copious to warrant the use of the metal for the important purpose of a circulating medium. Besides China itself, of whose ancient mines but scant knowledge has reached the Western world, there were the ancient mines of the Golden Chersonesus (Siam), which have been identified with the Tarshish and Ophir of the Bible, and the tundras of Tibet, or Siberia, the latter of whose produce must have found its way into China by way of Cathay (Manchuria).

As going to show the alteration of climate that has taken place in the vicinity of the last named mines, it may be stated that they present evidences of having been worked not only for gold, but also for ivory; for these tundras are in places full of the carcasses of elephants and rhinoceroses preserved in the ice; both of them still yielding ivory of marketable value. Within the last two centuries some 300 carcasses have been exhumed by the Tibetan and Siberian miners; while recently nearly a hundred more were found practically in a single cluster. In 1898 no less than 80,000 lb. of fossil ivory were offered for sale at the Yukutsk fair; the principal source of supply during the whole period mentioned being the Island of Liakoff, north of the Manchurian tundras.

The forces which can be considered as active in producing faults, according to H. F. Reid, who recently discussed the matter before the Geological Society of America, are: horizonal tensions and compressions; vertical forces (upward or downward); and horizonal drags on the under surface of the crust. In a uniform crust, horizontal forces alone produce normal or thrust-faults having hades of 45°; that the available vertical forces alone would produce normal faults with a smaller hade, and that the addition of a tension to a vertical force increases the hade, whereas the addition of a pressure diminishes it. Drags will generate pressure and tensions; they may cause faults with horizonal displacements. The elevation of large regions is due to vertical and not to tangential forces.

Gases obtained by extraction from granites by the aid of a vacuum have shown by analysis the following composition, as reported by W. H. Tilden in the *Proceedings* of the Royal Society of London: CO_2, 23%; CO, 6.45; CH_4, 3.02; N_2, 5.13; H_2, 61.68.

Geology at Globe, Arizona.

Written for the Mining and Scientific Press
By F. L. Ransome.

*In 1903 was published the first report[1] by the United States Geological Survey on one of the southwestern copper districts, based on field work done in 1901 and 1902. At that time practically nothing was known of the geologic relations of the copper ores of Bisbee, Clifton and Morenci, Ely, Bingham, and Yerington. Low-grade disseminated deposits, such as have recently come into prominence, were commonly looked upon as unworkable under then existing conditions. In view of these facts and of the great revival of mining activity both at Globe and Ray the time seemed opportune for a re-examination of the Globe district in the light of new knowledge, and I have recently spent two weeks in this work and in a reconnoissance of the country lying between Globe and Ray.

The reader of the following notes should, if possible, have before him the geologic map of the Globe district,[2] as it is impracticable in this place to reproduce it or to present more than the most meagre outline of the general geology. It must suffice to say that at Globe there is a pre-Cambrian crystalline complex consisting of the Pinal schist and a number of granitic intrusives, among which was originally included the Schultze granite. This complex is overlaid by the Apache group, mainly quartzite and doubtfully referred to the Cambrian, upon which rests the Globe limestone of Devonian and Carboniferous age. These Paleozoic rocks are much faulted and were extensively invaded, probably in Mesozoic time, by diabase. In early (?) Tertiary time a large part of the region was covered by a thick flow of daeite which was faulted and eroded prior to the deposition of the Gila conglomerate, the youngest important formation in the Globe district.

Much interest has of late centered about the Schultze granite, owing to its relation to the Miami-Inspiration belt of copper deposits. This rock is exposed in the west central part of the Globe quadrangle as a very irregular area about nine miles long in a northeast-southwest direction and about six miles in greatest width. Northwest of the main mass, separated from it by a strip of schist that in one place is not 300 yards wide, is a smaller area of granite which in the Globe report was correlated with the Schultze granite on petrographical grounds. This may conveniently be designated the Porphyry Mountain mass. A re-examination of the Porphyry Mountain mass shows that the correlation with the Schultze granite was an error, into which I was led by the proximity of the two masses and by the general similarity of the rocks as shown by thin sections. The Schultze granite proper cuts the Pinal schist, but is nowhere within the Globe quadrangle, in contact with the Paleozoic formations. Consequently its age is not definitely determinable from local evidence. In Professional Paper No. 12 it was assigned to the pre-Cambrian, partly because most of the granitic rocks of Arizona were at that time generally believed to be older than the Cambrian and partly because the Porphyry Mountain mass, then supposed to be the same as the Schultze granite, is clearly overlaid by Paleozoic quartzite north of the Continental mine. Neither of these reasons now has any validity. So far as the Globe quadrangle is concerned, all that can safely be said is that the Schultze granite is younger than the Pinal schist and at least one of the pre-Cambrian granites, but is older than the dacite, which clearly overlays it in the vicinity of the Pinal range, in the western part of the quadrangle. It is true that south of the new town of Miami the Schultze granite has intruded and metamorphosed a small body of basic rock called metadiabase in the Globe report, and that in all probability, as will be seen, this metamorphosed rock was originally a mass of the common diabase of the district; but this identity could not have been safely inferred in 1902 without other evidence.

In the last few years work outside of the Globe district has thrown new light on the age of the Schultze granite. The close dependence of a large number of the most important copper deposits of the Southwest upon intrusions of post-Paleozoic granite or monzonite rocks has come to be generally recognized, and C. F. Tolman, Jr.,[3] deriving his conclusion mainly from the unpublished work of J. E. Spurr at Ray and of W. H. Weed at Miami, has suggested that the Schultze granite is "post-Paleozoic (Tertiary?)." My own examination at Ray shows that the more or less altered granite porphyry associated with the copper deposits cuts the normal diabase of the region and passes to the west into a granite petrographically identical with the Schultze granite. Moreover, at Troy, six miles southeast of Ray, an even-grained granitic rock, probably a quartz monzonite, cuts both quartzite and diabase and is apparently the chief factor responsible for the copper deposits at that place. In view of these facts, unknown when the Globe report was written, there can be no reasonable doubt that the Schultze granite is not pre-Cambrian, but is post-Paleozoic. Whether it is Mesozoic or Tertiary is perhaps not yet determinable. But as it is older than the dacite, and has been deeply eroded, I am inclined to believe that, like the granitic intrusions at Bisbee and Clifton, it is Mesozoic.

In Professional Paper No. 12 the primary copper ore at Globe was thought to be genetically connected with the intrusion of the diabase. The widespread association of copper ores with granitic intrusions throughout the Southwest had not at that time been recognized and the orebodies of then known importance near Globe were all closely associated with the diabase. It was natural and reasonable under the circumstances to regard this association as genetically significant. At the present time, however, the evidence from other districts and the occurrence of the Miami ores indicate that the intrusion of the

[3]Mining and Scientific Press, Nov. 13, 1909, pp. 646-658.

Schultze granite was the chief factor in the deposition of the copper ores. Inasmuch as the ores were probably not derived from the masses of granite and granite porphyry now visible, but from deeper sources, it does not appear necessary to endeavor, as Mr. Tolman[4] has done, to show that the Schultze granite extends eastward, directly under the Gila conglomerate of Globe valley, to the Old Dominion mine north of Globe. There are, moreover, grave objections to his hypothesis, two of them being fatal. In the first place, the main mass of Schultze granite does not pass under the conglomerate, but is so limited along its eastern border by Pinal schist as to render any such bodily extension to the east improbable. In the second place, the peculiar granitic material near the Old Dominion mine, supposed by Mr. Tolman to be Schultze granite, is not that rock, but is petrographically identical with the pre-Cambrian Madera diorite of the Pinal range. Finally, the workings of the Old Dominion mine have extended far to the west under this granitic material and show that it attains no great depth, but is underlaid by dacite, which in turn rests upon much faulted diabase, quartzite, and limestone. This granitic material in the vicinity of the Old Dominion mine is so interesting a geologic feature and has hitherto proved so puzzling that it deserves some additional comment.

In the original Globe report attention was called to the occurrence northeast of Globe of a deposit composed almost entirely of fragments of Madera diorite. The principal exposures of this material extend from Copper gulch, half a mile east of town to the old Buffalo smelter on Pinal creek, a mile northwest of Copper gulch. The surface exposures are generally of such a character that an observer might readily conclude solid Madera diorite to be in place beneath them. Some of the ravine sections, however, as well as mine workings, show that the diorite occupies a position at the base of the Gila conglomerate and rests on dacite. In some places it actually grades into the characteristic fluviatile conglomerate and the deposit was described in Professional Paper No. 12 as a local basal phase of that formation. The homogeneity of the material, however, and the lack of evidence indicating water transport of much of it, were recognized as facts imperfectly accounted for in the explanation offered. During the past eight years the granitic deposit has been much better exposed in road and railway cuttings and in underground workings. It appears in some of these new openings as a thoroughly shattered mass in which the largest single fragments observed are from 5 to 6 ft. diam. Wherever penetrated underground the material shows the same thorough shattering. Cross-cuts through it, such as the lower drain tunnel of the Old Dominion mine have to be closely lagged. In one place, in Copper gulch, the Gila conglomerate may be seen lapping up over a slope of this shattered Madera diorite, the contact between the two being definite. In other places the broken quartz diorite has supplied so many angular or slightly rounded fragments to the overlying Gila conglomerate that there is a gradation between the two formations, and to this fact, together with the position of the quartz diorite above the dacite, was due the former assignment of it to the Gila formation. The better opportunities for study now available have suggested another hypothesis, namely, that the shattered Madera diorite is a thin wedge that has been thrust over the dacite from the southwest by faulting. Investigation has fully confirmed this view. Wherever a shaft has gone through the quartz diorite it is found to be separated from the dacite by a zone of trituration and slickensiding that is plainly due to fault movement. One of the best exposures of this fault-plane is to be seen in a small prospect tunnel about 2000 ft. northeast of the Old Dominion smelter. This tunnel runs N.15°E. for about 150 ft. through the shattered Madera diorite and then passes for 20 ft. through a fault-breccia in which rounded polished fragments of the quartz diorite are embedded in a sheared gouge composed of triturated quartz diorite and dacite. This is separated from the solid underlying dacite by a smooth slip-plane dipping 37° to the southwest. The course of events was as follows: After the Paleozoic sediments and diabase had been much faulted and eroded, they were covered by the flow of dacite. This in turn was probably eroded and then a thrust was developed southwest of Globe, probably in the area now deeply buried under Gila conglomerate, and a mass of the pre-Cambrian Madera diorite was shoved over the dacite to the north-northeast. The shattered mass thus bodily thrust over the dacite was readily attacked by erosion and supplied much detritus to the Gila conglomerate. Finally, the Gila conglomerate, the remnant of the underlying wedge of shattered diorite, and of course all of the underlying rocks were affected by the normal faulting already discussed in connection with the description of the Old Dominion mine in Professional Paper No. 12.

Within the shattered Madera diorite at the Old Dominion mine is an east-west strip of similarly broken yellowish granite porphyry, probably 300 ft. or more in width, but without well defined limits.[5] This appears to represent a dike in the Madera diorite intruded before the thrust faulting took place. It closely resembles some of the porphyritic varieties of the Schultze granite mass and was probably intruded at the same time as was that body. The recognition of this thrust faulting introduces a new element into our conception of the structure of the Globe district and one that may prove to be of much practical importance as the mines become deeper. There is evidence of movement of the same kind, for example, in the Live Oak mine near Miami, where the Schultze granite for a considerable area has been found to be underlaid by Pinal schist, the contact being an undulatory nearly horizontal zone of faulting.

Finally, it is probable that the intrusive mass mapped in the Globe report as the Lost Gulch monzonite and placed in the pre-Cambrian is really younger. Its relations to the Paleozoic rocks are nowhere shown, but as it is cut by diabase it is older than the Schultze granite. It is now provisionally assigned to the early Mesozoic.

Gold Dredging at Paracale.

Written for the MINING AND SCIENTIFIC PRESS
By An Occasional Correspondent.

The Paracale district, on the southeast coast of the Island of Luzon, in Camarines Province, Philippine Islands, is becoming important as a dredging field. This region has long been known for its gold and natives have panned gold in the streams for centuries. After the discovery and conquest of the islands the Spaniards early undertook mining. But it was not until the early nineties of last century that much was attempted in the way of modern methods in mining. An English company, which had secured large concessions, began the installation of crushing machinery, and in 1896 some Spaniards and *mestizos* of Manila constructed a small bucket dredge and put it to work on the Paracale river. This dredge was a mere pigmy. It did not have more than four or five horse-power and could not dig to a depth of more than ten feet—about one-third the distance to bedrock in most parts of the river. Its capacity could not have been over fifteen or twenty cubic yards per day, and it did not even handle its own dirt, which was transported by small boats to an arrastre on the bank of the river for treatment. Not much opportunity was given the dredge to demonstrate its value as a gold winner. The Philippine insurrection against Spain, which broke out shortly after the installation, stopped all mining operations in the district. For years the dredge stood on an island in the river where a high tide had beached it and finally fell to pieces.

Map of Northern Philippine Islands Showing Location of Paracale District.

Little further was done in mining in the Paracale district until about the year 1905, three years after an American mining law had been put in effect. Late in that year Frank B. Ingersoll and A. J. MacDonald, of Manila, completed negotiations with New Zealand dredging people by which the latter agreed to send a man to test a tract of about 500 acres acquired by the former on the Paracale river directly in front of the town of the same name. As an inducement to put the deal through the claim owners, who had previously been unable to arouse any interest in the United States, posted a cash deposit in a Manila bank which was to be forfeited to the New Zealanders in payment of expense of their representative in case he made an unfavorable report on the property. On the other hand, they agreed to install a dredge in case the value of the ground was as represented. The man sent out to do the testing was George R. Fearby, an Australian miner, who was afterward murdered in Cochin, China, by natives while prospecting for tin. Mr. Fearby brought with him to Paracale a hand-boring apparatus and started testing in January 1906, occupying several months in the work.

As a result of Fearby's report his principals shipped over from New Zealand some second-hand machinery, and the work of setting up a dredge was begun in February 1907. It was completed in August, but when William Kane, the dredge-master, arrived from New Zealand to take charge, he discovered that the apparatus was not adapted to the kind of ground found on the Paracale and a long shut-down followed in order to give the dredge a general overhauling and to remodel the gold-saving devices. Finally, in November 1907, dredging operations were resumed, but in less than sixty hours after the machinery was started the boiler failed, the accident being due to a defective plate. It took some five or six months to procure another boiler and put the dredge in shape to resume operations. Work began again in April 1908, and about the middle of May had blocked out a face and was taking out gold. The record of this dredge, considering the amount of dirt handled, has been phenomenal. Between May 25, 1908, and January 1, 1909, it produced 2814 oz. of gold from the working of 50,244 cu. yd. of dirt. The amount of ground handled did not average 300 cu. yd. per day of 24 hours, and much of the time the dredge was shut down for repairs. The gold was worth $18 per ounce, giving the total product a value of $50,653. The dredge was not operated between January 1, 1909, and February 6, 1909. Between this latter date and July 1, 1909, it handled 44,356 cu. yd. of dirt, with an extraction of 2171 oz. of gold. The whole period from May 25, 1908, to July 1, 1909, shows 94,600 cu. yd. handled with a return of 4985 oz. valued at $89,731 United States currency. This is an average of a trifle less than 95c. per yard. The dredge has a 70-hp. boiler, 60-hp. engine, a digging ladder 62 ft. in length, a revolving screen, and 37 digging buckets, each of 4½ cu. ft. capacity. The pontoon is built of Oregon pine and is 114 ft. long, 30 wide, 5 ft. 6 in. deep at the bow, and 9 ft. deep at

the stern. The greater depth at the stern is required to support four sluices, 80 ft. long, which have an overhang of 30 ft. beyond the stern of the boat. The general system of gold-saving includes a big spread of expanded metal and cocoa matting.

While this dredge has a bucket capacity of 2000 cu. yd. per day, it has averaged about 15% of that figure in actual digging. What a powerful modern dredge with suitable appliances could do in the way of paying dividends in such rich ground is easily figured. The percentage of black sand found in the dirt is large, and it carries the fine gold with it to such an extent that the sand must be saved in order to win the gold. On an average probably a ton of black sand per day is saved. Another peculiar feature is that each day the dredge buckets bring up from the bottom of the river an average of five to six tons of soft free-milling 'sugar quartz' which is rich in visible gold. Several thousand tons of quartz and black sand have been saved and will be treated by a Blake crusher, Huntington mill, and Wilfley concentrator which will shortly be installed.

The operations referred to have been carried on by a New Zealand corporation, the Paracale Gold Dredging Co., Ltd., working on shares with the claim owners. This company is capitalized for £10,000, with shares at £1, and these shares are now, January 1910, quoted at £5 10s. The success of this first dredge has given a big impetus to dredging operations in the Paracale district. A second boat has been installed farther up on the same river by another New Zealand company, the Stanley-Paracale Gold Dredging Co. This machine has been operating for only a few weeks, but, according to reports, has taken out some 50 or 60 oz. of gold per week. It differs from the first dredge in that it has no revolving screen or tables, its buckets discharging directly into a large sluice box. This company is also capitalized at £10,000, with shares at £1, and its shares are now, January 1910, selling at £2 10s. A third dredge has been installed on the Paracale river and is expected to produce shortly. This is a Risdon dredge with 3¼-ft. buckets, which was formerly set up on the Island of Masbate. It was bought by its present owner, the Philippines Gold Dredging Co., and removed to Paracale. This company is a Philippine corporation capitalized at ₱200,000. It has acquired about 250 acres of land in the plain bordering on the Paracale river next to the ground of the Paracale Gold Dredging Co., Limited.

The successful results already obtained in dredging have caused great activity among the prospectors, and probably 25,000 to 30,000 acres of alluvial ground have either been staked as placer claims or leased from the individual owners. It is not unlikely that one-third of this area will prove valuable for dredging. A great deal of testing is now going on and the coming year should witness the installation of further dredges. The Paracale river is really an arm of the sea with a rise and fall of some five or six feet of tide. The flat through which it runs is perhaps a mile in width near the mouth. It continues about the same width for a mile or more up and then spreads out into smaller flats with ranges of hills cutting in between. The total area available for gold dredging in this flat is about 1300 acres. The average depth to bedrock on the lower river is from 30 to 40 ft. Higher up where the Stanley dredge is at work the depth is considerably less. A great deal of sand and other fine material is found and probably not over 35% of the dirt handled can be stacked. Of the three dredges only the Risdon has a stacker. The bedrock is a soft decomposed gneiss. There are occasional patches of clay to be worked through.

The Malaguit river, which flows into the Pacific Ocean not far from the Paracale river, has been prospected to a considerable extent with hand-drills, and promises to furnish some large tracts of dredging ground. It has been located for a distance of about ten miles up from the mouth and, together with adjacent tracts of private ownership, there are probably 3000 acres of dredgeable ground, although as yet a considerable part of it has not been tested for gold. There is a much larger percentage of gravel and heavy material there than on the Paracale. Several other streams in the same district, all tidal rivers running into the Pacific Ocean, promise to furnish good dredging ground. The custom in the district is to have only five white men on a dredge; the dredge-master, three winch-men for as many shifts, and one extra man, who should be an engineer and machinist. All the other labor is native. The dredge-masters receive $200 to $250 per month and board, and the other white men $125 to $150 and board. The natives receive 37½ to 50c. per day, according to their ability.

Gas is frequently found in coal mines, but is usually considered only as a dangerous material to be driven out as promptly as possible. In one of the collieries of the Frankenholz Mining Co. in the Sarrebrück basin of Germany 'fire damp' has been saved and used as fuel. It was discovered in a diamond-drill hole while prospecting underground. Finding after a few days that the flow did not diminish, a pipe was fitted into the hole and the gas conducted to the surface for use under boilers. When the supply showed signs of diminishing a parallel hole was drilled about 35 ft. distant and an additional supply under good pressure was found. 'Blowers' of inflammable gas are not uncommon, being occasionally found even in metal mines, as at Silver Islet in Lake Superior. It is probable that they might be used more often, thus changing them from sources of danger into a valuable asset.

Vanadium is used mainly as an alloy of steel, to which it adds remarkable toughness. Its effect in steel is said to be due to its removal of oxygen and nitrogen, to its union in a solid solution with the iron, and to its formation of carbides that increase the strength of the steel. It is said that steel treated with vanadium has great resistance to shock and to fatigue caused by constant bending, that it makes much better saws and springs, and that high-carbon vanadium steels also make much better tools, such as cutters and riveting dies. About 0.1% of vanadium is used for deoxidizing and denitrogenizing steel, and about 0.25% of vanadium is left in the steel itself. It is ordinarily used with chromium or manganese, or both, to which nickel may also be added.

STAR OF THE CONGO MINE.

Written for the MINING AND SCIENTIFIC PRESS
By An Occasional Correspondent.

Work necessary in preparing the site for reduction plant, and getting the mine into shape for the production of 1000 tons per diem, is now under way. Operations have been much restricted due to the never-failing cause—native food supply. The contractors have heaps of grain, but the difficulty is in getting carriers to bring it in. This, however, will finally disappear with the advent of the railway next July or August. The experimental furnace work in connection with the reduction process is in full

Map of Central African Copper District.

swing, and the results obtained coupled with the excellent shotting of the copper and the 2% of unreduced metal all point to the process proving success, thus eliminating blast-furnace operations. Copper will be made cheap when the best working conditions are attained. Eighteen months to two years from date should see the plant in full swing and cutting just a little ice in the world's production. Ruwe is closed again, pending labor and further prospecting. The main adit at Kambore is making good progress; it has now advanced 1000 ft. and within another 450 ft. it should strike under the old N shaft, when it will be in a position to handle over 3,000,000 tons of 14% ore.

An oxygen generator for emergency use has been invented by Clarence Hall, of the United States Geological Survey testing plant at Pittsburg. It consists of a small water can with lower compartment filled with sodium peroxide. When the emergency arises, the stop-cock between the two is opened slightly, the water comes into contact with the peroxide and oxygen is released. It passes through the water, becoming cooled, and through a mask to the mouth or nose of the person using the apparatus. The charge of chemicals is sufficient to last a half hour.

PHOSPHATE DEPOSITS IN IDAHO, UTAH, AND WYOMING.

Phosphate deposits in Idaho, Utah, and Wyoming were examined and mapped last summer by parties of the United States Geological Survey. On December 9, 1908, the Secretary of the Interior withdrew from all kinds of entry, pending an examination of their phosphate resources, lands in these three States covering 4,541,300 acres. All the lands withdrawn were not then supposed to be phosphate bearing, but they included all areas in which, according to the meagre evidence then available, valuable phosphate deposits might exist. Since that time field work and further study has led to the restoration of some of these lands to entry and the withdrawal of others, so that the total area now withheld from entry is 2,551,399 acres.

Two parties were detailed by the Survey to examine these fields. One working from Montpelier, Idaho, included Hoyt S. Gale, R. W. Richards, and C. L. Berger. W. H. Waggaman, of the Bureau of Soils, collected representative samples of phosphate rock and made field chemical determinations of their content of phosphoric acid. George H. Girty, a paleontologist of the Survey, was with the party during June and July. The other party, which was under the direction of Eliot Blackwelder, of the University of Wisconsin, examined phosphate lands in the extreme southern part of the area withdrawn, and studied stratigraphic problems in the northern part of the Wasatch mountains. Topographic work was done in two adjacent areas. One of these is in the extreme northeast corner of Utah and the other in the southeast corner of Idaho, and the two together form a region that includes much of the more accessible parts of the phosphate fields.

During the season the main party examined about 1200 sq. mi., mapped 400 sq. mi. in considerable detail, both geologically and topographically, and traced the outcrops of phosphate rocks in this area. Analyses of 330 representative specimens of phosphate show accurately the grade or quality of the material found.

The areal surveys made have defined the position and the geologic relations of the larger developed deposits, so that more reliable estimates of available tonnage can be obtained. The results of the careful study of the stratigraphic relations of the phosphate-bearing formations and the associated strata have simplified the work of identifying and tracing the deposits. Important outcrops of phosphatic beds have been found and mapped in areas lying beyond those now locally recognized as phosphate bearing. These deposits occur in readily accessible parts of the field and are not yet covered by mining claims. Evidence has been obtained of the existence in this field of deposits of high-grade phosphate rock in strata of Jurassic age that are much younger geologically than the deposits hitherto recognized, and although these deposits have not yet been shown to be of commercial value they may prove eventually to be of considerable importance. Final results of these surveys will be published later in one of the reports of the Geological Survey.

Discussion.

Readers of the MINING AND SCIENTIFIC PRESS are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy. The Editor welcomes the expression of views contrary to his own, believing that careful criticism is more valuable than casual compliment. Insertion of any contribution is determined by its probable interest to the readers of this journal.

Metal Losses in Copper Slags.

The Editor:

Sir—In your issue of November 13 last, J. Parke Channing suggests a method of calculating the amount of matte in a slag, which seems to me to be correct. The method is to determine the amount of gold in the slag, and with the supposition that all of the gold in the slag is in the form of matte, to calculate the amount of matte in the slag, using the ratio of gold to copper as found from a matte sample. Mr. Channing also writes that, "the remaining copper in the slag, amounting to about two-thirds of the whole, is probably in the form of oxide." In regard to this, Lewis T. Wright in a more recent issue says, "As stated in the paper," meaning one read by Mr. Wright before the American Institute of Mining Engineers, "the facts observed leave room for belief that some of the copper of the slag may have been existent as silicate." In Peters' 'Principles of Copper Smelting', page 113, we find the following: "When an ore is smelted, there is a considerable loss of values in the slag, resulting mainly from particles of matte or metal which have failed to separate properly from the slag, and, in a lesser degree, from the formation of oxides of the valuable metals—especially lead and copper—that have entered into combination with silica, and have thus become, chemically, a part of the slag." This view of the subject seems to be the one most favored at present by the metallurgist.

It is a recognized fact, that, if zinc is present in a slag, much of it is in the form of a sulphide. Personally I have known a slag rather high in zinc to contain 1.7% of sulphur. Allowing 0.2% of this for any matte, etc., in the slag, it leaves 1.5% of sulphur to combine with the zinc, or sufficient to form 4.5% of zinc sulphide. This zinc sulphide is ('Principles of Copper Smelting', page 393), in solution in the slag and evidently in solution in very much the same manner that any cuprous oxide or silicate is, if present. It seems reasonable, inasmuch as zinc has much the same power of replacement for copper that iron has, to suppose the following reactions to take place:

$$Cu_2O + ZnS = Cu_2S + ZnO$$
$$Cu_2SiO_3 + ZnS = Cu_2S + ZnSiO_3$$

Copper is in much the same condition in a slag, both as to quantity and physical characteristics, regardless of the presence of zinc. Therefore the assumption that the copper in a slag, aside from that in the form of matte, is in the form of cuprous sulphide, seems reasonable, and, furthermore, that it is dissolved in the slag in much the same manner as zinc sulphide.

In endeavoring to prove this, I have tried to find a slag, which contained no elements other than copper likely to be combined with sulphur. The only one at hand is that made at the reverberatory furnace of the Union Copper Mining Co., at Copperopolis, California, in the summer of 1907. An analysis of the roasted ore follows; also the copper and sulphur content of the slag. To flux the ore about 10% of quartz was added and the slag formed was a rather stiff one due to the large amount of alumina and magnesia in the ore, which probably caused more matte to be suspended in the slag than is usually the case.

ANALYSIS OF ORE.

	Per cent.
SiO_2	21.80
Al_2O_3	13.00
MgO	6.30
CaO	1.00
Cu_2O	3.37
$CuFeS_2$	10.57
FeS_2	5.87
Fe_2O_3	20.20
$FeSO_4$	5.10
FeO	8.90
Combined H_2O	2.82
	98.93

	Cu, per cent.	S, per cent.
Matte	45.00	23.00
Slag	0.63	0.23

Assuming that all of the sulphur in the slag is either in the form of cuprous sulphide or matte, a determination of them separately is made as follows: In copper sulphide, from the atomic weights, the ratio of copper to sulphur is practically 4 to 1. In the matte, by means of the analysis, the ratio is 2 to 1.

Let

C = the copper in the form of Cu_2S
C′ = the copper in the form of matte
S = the sulphur in the form of Cu_2S
S′ = the sulphur in the form of matte

Then

$$C + C' = 0.63$$
$$S + S' = 0.23$$

and

$$C = 4S$$
$$C' = 2S'$$

Substituting

$$4S + 2S' = 0.63$$
$$4S + 4S' = 0.92$$
$$2S' = 0.29$$
$$S' = 0.145$$

C = 0.34% copper in the form of Cu_2S
C′ = 0.29% copper in the form of matte

Some experiments were conducted, during the summer of 1907, at the above mentioned plant by the superintendent, H. W. Ross, as follows: The reverberatory furnace was operated as usual, with the exception that the charge before skimming consisted entirely of a concentrate of pure sulphide, containing about 8% copper. Assuming that this charge melted into a matte, containing about 10% copper and leached through the slag replacing the suspended matte containing 45% copper, with a 10% matte, but not affecting the cuprous sulphide dissolved in the slag, we can multiply 0.29 by 10/45 and obtain 0.06% copper in the form of matte under the new conditions. If we add this to the 0.34% as cuprous sulphide, we obtain 0.40% as the total copper in the slag. As actually found in practice this

slag contained 0.45% copper. The slag and matte at Copperopolis contained no gold or silver, otherwise, it would be interesting to calculate the amount of free matte in this slag by the method suggested by Mr. Channing.

The conclusions therefore from these data would seem to be that the copper in the slag is in two forms; first, as cuprous sulphide dissolved in the slag in a manner similar to zinc sulphide; second, as matte particles suspended in the slag, which amount, in a good slag and one well settled, ought to be small. The data given are not by any means sufficient to prove these conclusions, and I shall be glad to see some more discussion upon the subject, either for or against the above statements.

N. M. Zopf.

Kennett, California, January 22.

Conservation and Some Difficulties.

The Editor:

Sir—In reference to your editorial on the article of Horace V. Winchell in your issue of December 18, I beg to inform you that from a long residence within Forest Reserves, I am in a position to know that his pen-picture of the Dakota widow guarding her six trees is not in the least over-drawn. I have known of several cases where widows have been denied the 'free-use permit' for fuel, merely because they happened to take in washing or keep a few boarders in order to make a living. I have known of prospectors who had violated no law being bulldozed to such an extent that they abandoned their claims, to be re-located by some friend of the ranger. In one case a wire fence was run across a miner's claim, and thereby the rangers shut off his camp from the public highway. I have known of several cases where a permit for some 'special privileges' was wanted and where the application has been returned repeatedly, and for no apparent reason other than to wear out the patience of the applicant or to delay the issuance of such permit until some power-company or other favorite should have an opportunity to file a later application, have it acted upon, and thus secure that which the former applicant had asked for. Without a Forest Service and an every ready 'permit system' to hold up the people (the permit has been made to answer the same purpose as a gun in the hands of a highwayman), the power companies, at least the Huntington companies, would never have secured the hold upon the streams of the West that they now have. It looks sometimes as if the Forest Service was a sort of 'bureau of information' run to keep the power-companies posted as to the wants and desires of the settlers. Government by permit, as exemplified by the administration of the Forest Service is un-American and wrong in principle. In practice it is worse. The Forest Service seems to be getting into everything except practical forestry; and seems to show an especial dislike to the mining business. It would require a miner to have a paying mine before he be allowed to locate the ground, and it seems to have no regard at all for his rights. In one case where a miner working at a distance from supply points had planted a few vegetables within the limits of his claim and had put a little brush fence around it, the ranger made him destroy the fence and denied him the right to keep out the stock. In another case where the miner had planted a few potatoes within the limits of his claim, and was accomodating enough to sell a sack of them to the ranger who claimed to be out and unable to get potatoes without making a long trip for them, the miner was required to pay acreage rent on his claim, on the ground that he was using it for other than mining purposes. This was extortion, pure and simple. In another case where a miner had the prior legal claim, according to advices from the land office, for some land upon which the Forest Service had designs, the miner was cited 'to show cause,' on the ground that a 'special examiner' had reported "no gold visible in any of the leads within his claim." It was a placer claim and had the word 'placer' written on the face of the notice. He was threatened with arrest if caught prospecting and was instructed to prove the mineral character of this particular piece of ground by doing work on other lands, and finally they tried to get him to sign a relinquishment, the contents of which were wholly false. He declined, but retained the copy and furnished a duplicate to the Land Office. The Forest Service sought to obtain possession of the original, and finally, with a promise to return him an exact copy, typewritten, he let the ranger have it, but not until I had secured a copy which I still hold. This paper purported to come direct from the office of the Chief Forester in Washington. The miner is still waiting for the copy that was promised him. As to the special examiners, Mr. Winchell has told but a small fraction of the tale. Special examiners are sent out by the Forest Service on almost any pretext when a permit is wanted, and the examiner will usually explain to the applicant that he has nothing to do with the matter in hand, himself; that he has only to examine into the merits of the case and recommend. A little later he will tell the applicant that he can recommend or not. In the further course of the conversation he will manage to repeat this statement a few times with a little more emphasis on the word 'can' each time. By the time he gets through he will have the applicant thoroughly convinced that everything depends upon his recommendation, and that a recommendation favorable to the applicant would be of great benefit to said applicant. Was there ever a scheme better calculated to lead to grafting than this permit system of the Forest Service? It is any wonder that the Secretary of the Interior, Mr. Ballinger, has found reason to refuse to accept recommendations from this source? In several of the pamphlets sent out by the Forest Service and quoted in the halls of Congress, this statement appears: "Prospecting and mining are absolutely unchecked." In my opinion this statement is absolutely untrue. No harder blow can be struck at the mining business than to discourage the prospector and the small miner, and I dare say that in nearly every case where a mining district has been put within a reserve the production by 'small miners' has shown a decided decrease. Not only is the prospector being driven from the field, but a study of the school-census will also show a decrease in popula-

tion within the reserved areas. Not that the Forest Service has promoted the race-suicide, but the fact remains that the policies and practices of the Forest Service are driving outside the reserved areas everybody who is not tied down by property or business. Why does the Forest Service assess the miner $50 per year rent for a 5-acre mill-site on land that was formerly sold at $1.25 to $2.50 per acre? Why is the miner required to give bonds and go to more expense and through more red tape to get a permit to lay a few rods of pipe or a common V-trough to conduct water for a short season, than is required of a power-company to get a right-of-way to be held for several years, and why is the latter right extended again and again without action? The only apparent reason for this is to keep the miner from locating any water-right that might interfere with the plans of the power-companies. Since the meeting of the Irrigation Congress at Seattle, the Chief Forester has had a great deal to say about the power-combine. It will be noticed, however, by the observing ones, that his kick has been directed only against those who have got in ahead of the Huntington companies. In the *Fresno Republican* of May 16, 1908, two letters were published over the signature of Gifford Pinchot. In the first, addressed to Dean Kirchhoff, Mr. Pinchot stated that he had no information whatever that the Huntington companies are trying to monopolize anything, or words to that effect. In the second letter it is stated that "the Forest Service has never shown any favoritism toward the power-companies." Now, as these letters were published soon after I had called the attention of the Forest Service to several specific cases of the rankest kind of favoritism benefiting the Huntington companies of which Dean Kirchhoff is president, I can but view the publication of these letters at that particular time as being for political purposes and with intent to deceive. I have also seen other examples of this favoritism since the publication of these letters. Probably no other branch of the Government has ever sent out as much misleading literature, not even David T. Day's black sand articles, as has come from the Forest Service, and much of it bearing the approval of the Chief Forester. Much has been said by the conservation writers about 'timber thieves' and 'grass thieves', and reading some of these articles in Eastern papers one not familiar with the facts would be led to believe that nearly everybody in the West was a rascal. I have lived in both the East and the West and have found no place where the rights of others are more respected or where personal property is safer than in the mining camps and the mountain districts of the West. Most of these 'timber thieves' and 'grass thieves', when it comes to square dealing, will compare favorably with the management of the Forest Service. There are few miners who would not scorn to stoop to the petty acts of extortion and blackmail practised by the Forest Service. It is just as honorable for a 'grass thief' to lawfully pasture his cattle upon the public domain, until some law is enacted forbidding it, as it is for the Forest Service to collect money from cattlemen for the use of land that they have no business at all to rent; for instance, lands included within a mining claim, or to take money from cattlemen for the use of certain portions of land, and then allow several thousand head of sheep to run over the land. This reminds one of the man who gives a check on the bank, and immediately withdraws his money from the bank before the check is presented. To take money for some 'special privilege' and then to deny in part or in whole that which has been specifically paid for, under a little clause printed at the bottom of permit forms, which reads that: "permittee agrees to obey all rules and regulations now or hereafter made by the Forest Service," by claiming that a new rule has been made since the permit was granted, is dishonest. I have read much of the great wisdom with which the reserves are administered. Surely the wisdom displayed in compiling some of these permits is great enough to excite the envy of a bunco-steerer. In 1905 the Secretary of Agriculture wrote a letter recommending the passage of a bill granting an extension of time to the Edison Electric Co., in which to construct some power-plants on Kern river (the rights were held by others prior to the Edison Electric Co. taking hold). In this letter one of the reasons assigned by the Secretary for recommending the passage of the bill was that these plants were being constructed throughout a country that was subject to mineral location. This ought to have been a good reason for his withholding his recommendation to have the country longer tied up. But he goes on to say that the power-companies have frequently been called upon to make an unreasonable money-settlement to the mineral locators and that some of these cases were nothing less than blackmail. For every case where the Edison Electric Co. has paid an unreasonable sum of money to a miner on Kern river that the Secretary can specify, I will show two cases where the miners have paid money or given up valuable considerations to the Forest Service under circumstances that will come nearer filling the requirement constituting blackmail than cases specified by the Secretary. The Edison Electric Co. has sold out its holdings to the Southern California Edison Co., and I presume that S. C. Smith of the House or F. P. Flint of the Senate will introduce bills to grant another five or ten-year extension of time. If the Secretary of Agriculture wishes to further use his office to promote this system of monopolization, it is to be hoped that he will do so next time without libeling the miner.

E. L. Allison.

Bakersfield, Cal., December 21.

[Mr. Allison's vigorous castigation of the Forest Service expresses a point of view which must be considered in any settlement of the questions raised. It is right and proper that injustice or favoritism incident to this or any other branch of the Public Service should be promptly made public. Whenever turning on the light raises objections it is time to start the dynamo, and from an intimate acquaintance with officers of the Forest Service we feel sure that an earnest effort is being made to insure prompt and equal justice in its dealings with the public. The complaints made by Mr. Allison deal in part with

ill-advised and arbitrary acts, of rangers mainly, which result in petty grievances and much local friction. This is inevitable in a new service and with new men. Just such public discussion is, we think, one of the best means of correcting it. Of the other questions, relating to conflicting claims for water-rights, we have no knowledge, but we can well believe that miners having claims on a right of way may have held them at prices which amounted to blackmail. We believe miners to be as free, but not necessarily any freer than others, from ordinary human failings, and we have several times had cause to remember that each question has at least two sides. In this case Mr. Allison is, frankly, presenting one side.—EDITOR.]

Channing on Mining Investments.

The Editor:

Sir—In a recent address before the Finance Forum in New York, J. Parke Channing says, "Unless you are actually in the mining business or make a thorough investigation, it is not for you to invest your money in prospects. This must be left to those people distinctly in the mining business, or to development companies who can afford nine failures out of ten."

It has been my observation that the majority of the profitable producing mines of this continent received their original prospecting and development at the hands of men of limited means, usually of a small local syndicate or stock company, the personnel of which is largely composed of the local camp merchants and friends of the owner or promoter of the prospect, and that this local financial combination either ultimately proves the value of the prospect and sells out at a profit to a larger aggregation of capital, or else 'goes broke'. It is notorious that the strong exploration companies and development companies which Mr. Channing says can afford nine failures out of ten, will not even send their engineers to examine undeveloped prospects. These large companies and combinations of wealthy operators want developed mines, as many a Western claim owner has found to his sorrow after spending all his limited 'wad' in New York trying to interest these 'big fellows' in his prospect.

I would like to ask Mr. Channing if the investor in large enterprises like Nipissing, Greene-Cananea, Utah Copper, Ray Consolidated, Nevada Consolidated, Miami, Inspiration, and Dominion Copper, who makes his investment in some one of these stocks after reading the reports and endorsements of the enterprises made by leading mining engineers, is going to get a 'better run for his money', eliminating the feature of quick turns in the stock market, than if he should invest his money in a prospective mine endorsed by engineers of the same good standing and experience.

Granted that investments in prospects, even under efficient and honest guidance, be hazardous, is it any more hazardous than buying stocks in some of the above-mentioned corporations where the control is always changing from one group of financiers to another? A great operating mine in control of one group of men may prove a better investment than when in control of a different combination of speculators who merely intend to prostitute the good name of the property for manipulative purposes, and who care nothing about the accuracy of reports and the integrity of operation. Who is going to tell the average investor as to who controls the property in which he contemplates an investment? The control may change overnight.

Of course a fair discussion of this question demands an absolute elimination of the stock-market features. By this I mean a man who buys Utah Copper, as an example, today and takes a profit tomorrow on a one-point rise, is not an investor. If I buy stock on an advancing market I am liable to make at least a quicker and possibly a larger profit on my money than if I put up money for the development of a prospect; but I would not then be mining. If I could always accurately forecast the market I certainly would never have to do any digging to make a competence. Meanwhile I prefer to take my chances with a promising prospect, knowing that most prospects if promising and intelligently developed seldom require large expenditure of capital to prove their merits or demerits as future profitable mines. I think it safe to predict that the time is rapidly approaching, if it has not already arrived, when the average mine investor will prefer to trust to the vagaries of Dame Nature in backing a small prospect than to take chances in going against the high-finance game as it is worked today in mines and industrials alike, by stock-market manipulation.

Will Mr. Channing please send the addresses of some of the 'development companies who can afford nine failures out of ten,' and are therefore supposedly willing to tackle prospects. I regard Mr. Channing's address as admirable in every respect excepting in the paragraph I have attempted to discuss.

PERCY WILLIAMS.

Vancouver, B. C., January 26.

Duties on Mining Machinery in Siberia.

The Editor:

Sir—I beg to acknowledge receipt of your letter of November 16. Mining machinery and supplies, parts of machines, and the like, enter the port of Vladivostok free of duty. In regard to shipments, it is important to note that each package must bear some mark and the gross and net weight, which marks must appear on the bill of lading. It is of great convenience to have the bill of lading issued 'To order' instead of to a certain individual or firm, as in this case it can be turned over to anyone to attend to the customs formalities; otherwise it is necessary for the consignee to give a power of attorney to the customs broker in each case, in order that he may secure delivery through the Custom House. In case the bill of lading is made out 'To order', it is necessary for the shipper to endorse it.

H. FRED NEWHARD.

Vladivostok, Siberia, December 29.

[The above communication is from the deputy American Vice-Consul at Vladivostok, and is in answer to our enquiries made in behalf of correspondents.—EDITOR.]

Special Correspondence.

LONDON.

Stratton's Independence Mill and Work. — Ouro Preto in Minas Geraes, Brazil, Makes Good Report.

Stratton's Independence has issued its first report since the reconstruction September 8, 1908. The mine is at present leased. During the year ended June 30, 1909, the amount of ore raised was 38,082 tons, of which 21,162 tons was sorted out and shipped to the smelters. The gross value per ton was $26.04, and freight and treatment came to $7.42, leaving a net revenue of $18.61. Of this net revenue 35.9% went to the company and the remainder to the lessees. The income of the company from this source was £32,360. The wet-mill for treating the dump-ore restarted on April 1, and during the three months to June 30 made a profit of £1037. The net profit was £13,221. Out of this £6250 is paid as dividend, which is at the rate of 5% on the capital, and the directors at the same time declared a similar dividend on account of the current year's operations. Development of the mine was re-commenced in November 1908 with the object of extracting medium-grade ore from the caved workings. This ore was to be coarse-crushed and the fine, containing the telluride, screened out and roasted. The trial operations were not successful because the capacity of the roasting furnace was much greater than the possible supply of ore. Philip Argall, the consulting engineer, is now engaged in elaborating an alternative plan for treating the ore without roasting. On starting the wet-mill in April 1908, treating the low-grade dump-ores, it was found that the average content was 26% less than was estimated when sampling the dumps. This made all the difference between profit and loss in treatment, so operations were suspended. Investigations were then made with a view to finding the richest parts of the dumps, and subsequently the plant was re-started April 1. During the three months to June 30 the ore treated amounted to 12,265 tons averaging $4 per ton, and yielded 158½ tons of concentrate containing 4.235 oz. per ton and 221 tons of concentrate containing 1.186 oz. per ton. The mill is now treating from 6500 to 7000 tons per month at a cost of $1.52 per ton, and another Chilean mill will shortly bring up the production to 10,000 tons per month.

Some extremely cheap cyanide work is found at the Ouro Preto gold mine in Minas Geraes, Brazil, and A. J. Bensusan, the superintendent, and R. H. Kendall, the metallurgist, are to be congratulated. The ore itself is of comparatively low grade, and the yield is about £1 7s. 6d. per ton. The process of extraction consists of catching free gold on blankets, concentrating on frue vanners, and cyaniding the concentrate. Within the past two years the sandy tailing from the vanners has been cyanided; the average content is only 3s. 6d. per ton. About 2s. 6d. is extracted at a cost of 6d. per ton. A plant has also been erected to treat the slime tailing and it started operations in June 1909. During that month 1300 tons was treated, and the extraction was 7s. 2d. at a cost of 1s. 11d. per ton. During the year ended June 30 last 73,166 tons of ore yielded 25,050 oz. of bullion realizing £100,609. The total cost was £88,627, and the profit (including £1206 interest, rents, etc.) was £13,188. Owing to extra expenditure on plant required to cope with an unexpected increase in the water entering the mine, and also on the new slime plant, it has been necessary to curtail the amount of dividend distributed. The preference shares receive £3663, which is the usual 10% on £36,334, and the ordinary shares, of which there are 100,000 of £1 each, receive £2500, or 2½%. In spite of the trouble caused by the increased inflow of water, development has been well maintained; in fact, the ore reserve is higher than the year before. The figures at June 30 were 202,030 tons, and there were many additional blocks that could be called probable ore. Stoping is done at several levels, especially at 315 metres, 470 metres, and 680 metres. Prospecting and development has been carried down to 1028 metres.

WASHINGTON, D. C.

Bureau of Mines.—Alaskan Problems. — Spitzbergen Coal Land. —Conservation Commission.—Borax Lands.

The bill creating a Bureau of Mines in the Interior Department passed the House with but three or four negative votes. It was evident the members had made up their minds some time before, for the eloquent efforts of James A. Tawney, of Winona, Minnesota, in opposition proved of but little avail. The burden of Mr. Tawney's plea was that that there were already too many bureaus; that another would cost money; and that the work was now being carried on effectively by the United States Geological Survey. Those favoring the Bureau declared that the task of the Bureau of Mines was one of such magnitude that it could not be carried on successfully by the Geological Survey without some of the other work being neglected. They also pointed to the high death rate in American coal mines and in the metal mines and made comparisons with European countries that were not at all to the credit of the United States. Still further, those favoring the measure declared that its endorsement by the United Mine Workers of America, representing labor; by the operators' organizations, representing the employers in a number of States; by national scientific bodies, States geologists, and others representing the scientific side of the problem was sufficient assurance for them that such a Bureau should be established. Mr. Tawney suggested that the Bureau if established might grow into a department, and one member retorted that this fear was proof that there was a wide and useful field for the Bureau. The bill was amended slightly in several places, but in the main it is the bill as reported by George Huff, of Greensburg, Pennsylvania, chairman of the House Committee on Mines and Mining. It provides for a complete investigation of the causes of mine accidents and other technologic investigations relating to mining, and for the transfer of the Technologic Branch of the Geological Survey and all the investigations now going on under that branch, the testing of coal, lignites, and other mineral fuel substances and the structural materials. The Senate Committee on Mines and Mining will consider the bill at an early date.

Alaska is looming large in Washington affairs these days. More than a dozen bills relating to the Territory have either been introduced or will be soon, all touching upon the mineral wealth and government of that district. Members of Congress were beginning to believe that the special problems of that wonderfully rich country were nearing solution, when John E. Ballaine, of Seattle, appeared upon the scene with a novel proposition. Mr. Ballaine, who is the owner of large interests in the Territory, has made a formal offer to the Senate Committee on Territories to lease 5000 acres in the Katalla and Matanuska districts at a royalty of 50c. per ton. Such a tonnage royalty, it is claimed, would net the Government $50,000,000 on the 5000 acres. Mr. Ballaine asks that Congress pass a law to authorize the head of one of the departments to lease to a coal company to be organized by him, at the same time prohibiting the leasing of other coal lands in the Territory for a less royalty. Mr. Ballaine offers to furnish bond for $1,000,000 for performance of his part of the agreement. The Government is also to agree, says the Seattle man, that part of its coal supply shall be obtained from this company or from a naval station which the Government may establish in the Matanuska district, the coal to be shipped over a railroad from Seward to the coast, to be built and controlled by the same interests as the coal company. This proposal contemplates a radical departure from past practices in the Government's disposal of Alaska coal lands. It comes avowedly to do battle with another proposition, embodied in a bill which has been prepared but not yet introduced, designed to permit the sale or lease of such lands at a rate of $10 per acre. Mr. Ballaine's proposal has attracted much attention, but it is too early to say whether it will be adopted.

At the suggestion of Henry Cabot Lodge, Senator from Massachusetts, the Senate has just amended the Guano Act of 1856, making it apply to coal and other minerals, which brings in a rather delicate International question. The

Guano Act provides that whenever any citizen of the United States discovers a deposit of guano on any island, rock, or key not within the lawful jurisdiction of any other government and not occupied by citizens of any other government, and takes peaceable possession thereof and occupies the same, such island, rock, or key, may at the discretion of the President be considered as appertaining to the United States.

This law has been found effective and adequate in its application to guano deposits, which usually are found upon rocky islands of no intrinsic value. Now the attempt is to be made to apply it to coal lands. Obviously the original act could hardly be construed to imply any considerable seisure of territory. The amendment to the law is sought in behalf of John M. Longyear, of Brookline, Frederick Ayer, of Lowell, Massachusetts, and other capitalists who are desirous of developing certain coal deposits in the Spitzbergen islands, which are claimed by no country. In his annual message President Taft dealt at some length on the anomalous position of the Spitzenbergen islands, and stated that the United States Government, in view of proofs filed with it in 1906, has accepted under reservation the invitation of Norway to participate in an international conference relating to the islands. These proofs showed the American possession, occupation, and working of certain coal-bearing lands in Spitzbergen, and the reservation prescribed that the question of altering the status of the islands and countries belonging to no particular State and as equally open to the citizens and subjects of all States could not be raised. The Lodge amendment, if finally adopted would tend to confirm the rights of Messrs. Longyear and Ayer and their associates in the coal lands already occupied.

Francis G. Newlands, Senator from Nevada, has introduced a bill in the Senate calling for the appointment of a national commission for the conservation of natural resources. The commission would consist of fifteen members with the following duties: to organize for the investigation of all questions relating to the conservation, use, and control of the water resources of the United States for navigation, irrigation, municipal supply, power, and swamp-land reclamation, to the prevention of floods and the maintenance of stream control, to the prevention of waste in the mining and extraction of coal, oil, gas, and other minerals, to the protection of human life in the mines, and to the prevention of erosion and soil wash, to the conservation of the forests, to the preservation of the public domain for homeseekers, to the protection of the timber, coal, iron, and oil lands of the United States against absorption by monopoly, and for the investigation of all other questions relating to the conservation of the natural resources of the United States for the preservation of its beauty, healthfulness, and habitability. This commission if formed would co-operate with commissions or boards appointed by the States for similar purposes, with a view to recommending suitable action by Congress and the States.

George S. Nixon, of Nevada, has just introduced in the Senate an important bill defining the manner in which deposits of borax and borate material may be acquired. The bill provides that all public lands within the United States, containing valuable deposits of borax, borate of lime, borate of soda, or borate material, shall be subject to location, entry, and patent under the placer-mining laws. Patents heretofore issued for lands containing such deposits, whether as patents for lodes or patents for placer, are to be confirmed. Placer patents heretofore and hereafter issued for lands containing such deposits shall vest in and convey to the patentee the title to all lands included within the exterior boundaries of the land described in such placer patent; provided that where lands containing such deposits have heretofore been located under the laws providing for the entry of mineral lode claims said locations may be perfected and patents issued under the laws applicable to lode claims; and provided further, that in case of any conflict between locators under the placer laws and the mineral lode law, on locations heretofore made of lands containing such deposits, the conflict shall be determined as though location of said land under either of the above laws was valid at the time said locations were made.

KALGOORLIE, WESTERN AUSTRALIA.

Output for November.—Consolidations.—Filter-Press Discussion.—Roasting Losses.

The gold output from the State in November was valued at $2,825,000. Of this amount Kalgoorlie contributed $1,530,000. The yield from the State for 1909 will be about $1,300,000 behind 1908.

Amalgamation of mining companies has been very fashionable on the Rand for some time, and seems liable to become so in Kalgoorlie. Just about complete are the amalgamation of the Hannans Star and Boulder Deep Levels; and the Chaffers and Boulder Main Reef on the south end of the Golden Mile. During the past fortnight plans for joint working of a number of mines on the north end of the belt have been arranged. The mines comprising the Oroya-Brownhill Co. are practically worked out, but the company has a good deal of cash, stores, and a 50-head mill. The Golden Link Eclipse mine nearby is a good mine with 71,000 or more tons of sulphide ore worth $8.50 per ton, with no mill in which to treat it. The capital of the Golden Link was increased to 1,250,000 shares at $1.25 each. The Oroya-Brownhill sells all its leases, mill, and stores for 500,000 shares. A number of adjoining leases called the Kalgoorlie Amalgamated with 142 acres takes 150,000 shares. There will be 100,000 shares in reserve. As regards cash, the Oroya-Brownhill contributes $75,000, the Link $75,000, and the Amalgamated, $33,000 as working capital. The new company is known as the Oroya-Links, Ltd., from January 12, 1910. The big residue dump on the Brownhill lease—now about 300,000 tons—and vacuum plant are not included in the deal. The new company will have an area of 313 acres in the following mines: Golden Link, Kalgoorlie Amalgamated, Brownhill, Oroya North and South blocks, Trafalgar, and Kalgoorlie Mint, and an interest in the Central and West Boulder. It has been practically decided to put in nine No. 8 Krupp ball-mills in place of the sixteen Griffin mills destroyed by fire at the Perseverance. The following figures show the difference in working these types of dry crushers:

	Krupp No. 5.	Griffin 30 in.
Size of feed from crackers...	3 to 5 in.	1 to 1½ in.
Cost of cracking per ton.....	8 cents	16 cents
Speed of mill	26 r.p.m.	198 r.p.m.
Horse-power absorbed	16 to 18	20
Capacity per day	40 to 45 tons.	37 tons
Product through 150 mesh...	40 to 50%	70%
Cost of milling per ton.....	50 cents	72 cents

The product from each type of mill is roasted and then ground in pans, the pans having to grind 20% more through 150 mesh from the ball-mills; but when all is considered, there will be a distinct saving of about 20c. per ton by installing the Krupp mill, which, in a mill of the size of the Perseverance—20,000 tons monthly—means a saving of $4000. The Krupp mill liners last from six to nine months, while the Griffin mill spares wear out in about two weeks. On the Perseverance there was continual work with the latter mills, and they caused much worry. At the 1550-ft. level in the Kalgurli, work has proceeded 154 ft. in ore 16 ft. wide averaging $18 per ton. This is satisfactory, as there were doubts as to the ore values at this level.

The November returns from the chief mines were:

Name.	Tonnage.	Value.	Profit.	Dividend.
Associated	41,327	$93,000	$19,500	$120,000
Associated North. Blocks.	3,630	21,000	3,000	.....
Chaffers	4,004	32,000	5,000	.....
Golden Horseshoe	25,742	245,000	98,000	.....
Great Boulder Proprietary	17,847	250,000	135,000	.....
Hainault	5,814	39,000	7,000	.....
Ivanhoe	19,488	200,000	100,000	.....
Kalgurli	10,760	142,000	77,000	.....
Lake View Consols.....	11,037	78,000	13,000	85,000
Oroya-Brownhill	11,710	*192,000	127,000	.....
Oroya-Black Range	4,457	56,000	20,000	.....
Sons of Gwalia.....	13,500	118,000	48,000	.....
South Kalgurli	9,089	62,000	13,000	50,000

*Account of the amalgamation (Oroya-Links) bullion reserve and special clean-up declared.

The Kalgoorlie branch of the Australian Institute of Mining Engineers met at the Chamber of Mines last week for the discussion of H. Adams' paper on 'The Disposal of Residue', and the reading of F. G. Brinden's paper on 'Roasting Practice on the Kalgurli Mine'. There was a representative gathering, and no lack of discussion. The argument on disposing of residue from filter-presses and vacuum plants mainly dealt with the pipe-lines and their troubles. It is believed that it is better to keep a pipe running full than half full, as there is a greater tendency to clog when running half full. At the South Kalgurli they are now experimenting with sluicing out the presses by pumping, but this depends on getting water at the special rate of 36c. per 1000 gal. It is not proposed to alter the presses like the Merrill press. It is rather early to discuss this new phase of the discharge of the press; but, if it can be done cheaply, the press will hold its own with any vacuum plant. The former type is more expensive in erection than the latter, and really there is not so much difference in the cost of treatment. Both processes have their little weaknesses in washing the slime cakes. Interesting work along this line may be anticipated. Mr. Brinsden discussed roasting of sulpho-telluride ore with about 3% sulphur in Edwards furnaces at a rate of 350 tons per day. Details were given of the analysis of the ore before and after roasting, of furnace construction, feeding the furnace, flues, flue-dust, and stack, of percentage of sulphur at different points in the furnace, grading tests, and other interesting information. In a certain part of the Edwards roaster SO_2 is formed, while in the Merton furnace a good deal of H_2SO_4 is formed on the arches beneath the third hearth. It was stated that the quantity of dust going out of the stack, 100 by 5 ft., is hard to determine, in fact, this is an undetermined quantity on this field. If any of the readers of the MINING AND SCIENTIFIC PRESS know of any method of determining the percentage of dust lost from smelters or roasting plants, an account would be read with interest. Some argument arose as to the origin of the iodine method of testing the roasted ore, which has been especially useful on this field. Dr. Earp, of the Perseverance some years ago, gets the credit for its introduction.

In the November number of the Chamber of Mines *Journal* is a short article and two tables on the 'Estimation of the Capacity of Vacuum Filter Plants', by T. B. Stevens, of the Oroya-Brownhill Co., where 750 tons are treated daily. The estimates are made by (1) the specific gravity of the agitator pulp, and (2) taking sections of the cakes from the filter-vat charges.

TORONTO, CANADA.

Porcupine Lake.— Snow-Shoe Claims. — Gowganda Shipments. —Ore-Stealing Laws. — International Nickel Company.

A. A. Cole, mining engineer, in an official report to the Ontario Government of an inspection made of the best known prospects in Porcupine lake, including the Wilson, Miller, Gillies, Hollinger, Davidson, and Bannerman, gives it as his opinion that all signs so far are favorable for a good gold camp. On all the properties visited he saw free gold in place, the veins being for the most part composed of rusty quartz with a wall-rock of schist. In southern Tisdale township on the Wilson, Miller, Gillies, and Hollinger, the veins run northeast and southwest and stand up in ridges above the adjacent schist. In other localities they are not so prominent. Several of the veins will average 25 ft. in width, one on the Wilson averaging 75 ft. for some distance. The problem of the occurrence of gold at depth has not as yet been solved. In this connection great interest attaches to the diamond-drilling now in progress on the Miller claim, an option on which is held by M. J. O'Brien, the Cobalt millionaire. Mr. O'Brien has had a force of men at work on the property for some time, but is not yet sufficiently satisfied with the results as found at a depth of 50 ft., to close the option and pay the $300,000 purchase money, but has asked for a month's extension. Active operations are being begun on behalf of the McArthur Gold Mining Co., a Scotch concern, which has acquired the Brannerman, Way, and Griffith claims at the northwest end of Porcupine lake. Their representative, Peter McLaren, has engaged a force of 12 men and will sink two shafts on a quartz vein running from 4 to 8 ft. in width, where test-pits have shown gold well distributed through the quartz. Frank Cochrane, Minister of Mines, is endeavoring to put the public on its guard against the sellers of snow-shoe claims. He points out that in the case of claims staked when the whole country is under snow there can be no certainty of the bona fide discovery of minerals, and that a few discoveries do not mean that the whole country is studded with gold. A large number of engineers and mining men who have returned after an inspection of the field, while favorably impressed with the actual discoveries, are disposed to temper their enthusiasm, with a note of caution. A. M. Hay, president of the Trethewey mine of Cobalt, says that while the showing of free gold in the large quartz dikes indicate great possibilities, it must not be forgotten that the occurrence of these dikes has been known for some time, and that claims had been staked there four or five years since, including some of these dikes, the working of which had not proved the existence of gold in paying quantities. By far the larger number of claims, he said, had been taken up by prospectors who were merely trying to locate near the claims that were admittedly valuable in order to sell for the best price they could get. William J. Loring, of the British firm of Bewick, Moreing & Co., which is engaged in mining in various countries, after investigating the Porcupine camp declared that the prices asked for undeveloped claims were so exorbitant that his firm would make no investments on such terms, and that no influx of British capital need be expected until either the value of the locations had been proved by developments, or more reasonable views prevailed.

A second shipment has been made from the Gowganda district, the Reeve-Dobie mine having sent about 30 tons of high-grade ore to the Coniagas smelter at Thorold, Ontario. At the Waldman mine on the Gillies Limit the shaft is down 75 ft. and preparations are being made to stope east and west. The vein which dipped out of the shaft at 70 ft. had to be reached by a cross-cut, from which a raise was started, the vein at the head of the raise showing about 8 in. of smaltite carrying native silver. Driving has been done for about 70 ft. to the west, where another raise will be made. Further sinking of the shaft has been discontinued until cheap power is available, and in the meantime diamond-drilling will be done from the bottom of the shaft to discover the dip of the vein at 150 ft. Several tons of high-grade ore have been sacked. On the A 99 property, Gillies Limit, also bought by J. H. Waldman, a smaltite vein carrying silver has been traced for 60 ft. on the surface.

Existing legislation has been found altogether insufficient for the detection and punishment of high-grading, as it is almost impossible to prove that ore found upon a suspected person was dishonestly obtained. An important change is being made in the law throwing upon the suspected party the onus of proving how he came by the ore. A bill introduced into the House of Commons at Ottawa by George Gordon, M. P., for Nipissing, makes it the possession of gold or silver ore a criminal offence, unless the accused can satisfactorily account for it. It has received a third reading and will in all likelihood become law, the recent revelations in the Cobalt high-grading cases having shown the extent and frequency of the evil.

The Mines & Minerals Committee of the Canadian House of Commons, have undertaken to investigate the nickel industry and more especially the operations of the International Nickel Co. of New York, which controls most of the Sudbury deposits. Important evidence was given on January 19 by Arthur Wilson, an expert who has been studying the situation, who stated that the trust had retarded development by limiting the output in order to keep up the price. The export of nickel-matte from Canada to the New Jersey smelters amounted to 38,000,000 lb. annually, and he contended that the loss to Canada by making shipments in the form of matte in place of the finished product was about $1,000,000 per year. He suggested an export duty on matte and Government action to encourage the manufacture in Canada of nickel steel.

TELLURIDE, COLORADO.

Railway Repaired by Miners. — Liberty Bell, Tomboy, and Smuggler-Union Building.—Bear Creek.

Conditions at Telluride are again normal. The portion of the Rio Grande & Southern railroad which was destroyed by the bursting of the Trout Lake dam on September 5 has been replaced and communications both to the north and to the south has been restored. By the washing out of the tracks and trestles to the south, Telluride was cut off from both her coal supply and her outlet for concentrate to the Durango smelter. At a meeting of the mine superintendents of the district it was decided to offer capable miners and experienced foremen to the railroad company to assist in repairing this very important piece of track. W. H. Martin, for the railroad, accepted this offered assistance, and as a result of the energy of the combined interests traffic was resumed on the south on October 25. The mining companies were promptly reimbursed for their expenditures. Communication to the north was not restored until December 17. Meanwhile food supplies were shipped both by way of Durango and Placerville. From Placerville they were packed and hauled over Dallas Divide to Telluride.

Map of Southwestern Colorado.

The shortage of coal and other supplies prior to the repairing of the road caused several companies to suspend operations temporarily. At present, however, few, if any, effects of the disaster remain.

The Liberty Bell company is building a 3½-story boarding house, 40 by 165 ft. in size. It is situated at the mouth of the Stillwell tunnel and is completely removed from the danger of snowslides. It will be equipped with all modern conveniences. The company employs about 220 men in mine and mill, drops 80 stamps, crushing a daily tonnage of about 375 tons of ore. This will probably be increased shortly. In the mine a large block of ground has been developed within the last few years. To this the major part of the mine operations will soon be directed. The Tomboy Gold Mining Co., Ltd., employs in the neighborhood of 200 men, drops 60 stamps with a capacity of about 300 tons per day. Snowslides in this district have been somewhat severe. The buildings at the Japan tunnel were recently crushed and partly carried away by the Little Elephant slide. The buildings contained machinery, and the loss probably will be considerable. The slide filled the Tomboy wagon-road with 4 to 5 ft. of snow. The Smuggler-Union boarding and bunk-houses which were destroyed by fire a short time ago are being replaced by a large house, constructed along modern lines. The average output at the Smuggler-Union mills at Pandora is about 300 tons of ore per 24 hours. The Bear Creek region has been the scene of considerable activity in mining and in improvements. Notable among the latter is the completion of a tram from the Alta mine to Ophir loop. This tram will do away with the pack-train, which formerly was used in conveying concentrate to the loop. The numerous lessees have with few exceptions had a successful season, and considerable promising development work is now being carried on by them.

MEXICO.

Santa Gertrudis Mill. — John Taylor & Sons in Mexico. — Coal Combine.—Zacatecas M. & M. Co. Organized.

The final payment by the Camp Bird company was made to the Santa Gertrúdis company by a check for ₱9,144,825 on the Bank of Montreal. We understand that the design for the new mill is already under way. The mortars, of which there will be 16 single-discharge type, are built with extra heavy base, resting direct on concrete mortar blocks. The holding down bolts will be arranged as angle-bolts and will pass each other in an X under the base. To permit of this arrangement, the bolt-holes will be staggered. The mortars will be equipped with liners and every detail has been carefully thought out. All the various contracts that were pending by the Santa Gertrúdis company have been taken over and ratified by the new owners.

F. W. Turner, presiding at the meeting of the Anglo-Continental Gold Syndicate recently held in London, stated that they had decided to write off £50,000 to profit and loss as a result of the failure of their Santa Maria Mexican mines business. He further stated that the losses were principally due to the long drawn out litigation, which had been the curse of the enterprise, and for the present they were out of Mexican business, although they continue to hold leases on some silver-lead properties to the north of Zacatecas. It is reported that John Taylor & Sons will again become interested in Mexico. Their assistance is being sought to revive the Torres-Cherokee enterprise. They are also said to be taking an interest in some properties now held by the Mexican Mines Prospects Development Co., and to have also taken an option on a property belonging to Maurice Clarke in Oaxaca. It is interesting to remember that the founder of this house made the first favorable report on the Real del Monte mines, as the result of which that property passed into English hands in the early part of last century. One of the few successful English mining companies in Mexico is operating the now well known Barranca mines in Sonora. This mine has paid a total of 20% dividends for the year. The chairman, W. Hudson Hand, at the annual meeting, referred to the fine opportunities for investment in Sonora, as the results of the building of the Southern Pacific extension. The company had taken up a number of properties before the railroad was completed, and had made contracts by which it acquired a joint working interest in 17 mining properties in Sonora; these were not under option, but were actually owned. The chairman further stated that the extent and value of the properties thus secured will provide ample occupation for the company in Sonora for some years, and we have no doubt they will in time add enormously to our dividend-earning capacity. The San Rafael company at Pachuca has paid vast sums in dividends and has had bonanzas of phenomenal richness, but recently it has ceased to measure its production in ounces, and stated that the last week's production of bullion was 1¾ tons. An additional increase in the size of the mill is being discussed so that this splendid result may not only be maintained but surpassed.

It seems probable that a combination will be made among the coal miners of northern Mexico. A group which controls a number of properties has bought the control of others, including the Carbonera Porfirio Diaz. This company owns about 1000 hectares of land, and it has been estimated that this contains from two to three million tons of clean coal. The same group has also obtained control of the Lampacitos and Agujita Coal companies, the San Blas & Carbonifera del Norte, and the Rio Escondido company. Practically the only independent coal companies left are the Mexican Coal & Coke Co., the Compañia Carbonifera de Sabinas, and La Sanceda. There are rumors to the effect that these will also enter the combine. The coal business

in Mexico is now on the boom. This is largely due to the efforts of the Government to assist native industries. In this case it has been done by discriminative freight rates on the National Railroad lines.

A company has been incorporated with a capital of $1,000,000 under the title of Zacatecas Mining & Metallurgical Co. to take over and work the San Cristóbal and Zacatecas gold mines in the Zacatecas district. The president of the new company is Frederick Corning, who is also president of the Guanajuato Consolidated Mining & Milling Co. M. E. MacDonald was the moving spirit in the organization of the new company. He was for many years manager for the Guanajuato Consolidated company and he was the man who arranged the transfer of the Real del Monte Co. to the United States Smelting, Refining & Mining Co. of Boston. The mines controlled by the new company include the San Cristóbal group, which consists of the San Cristóbal, Zacatecas, Aldama, Elena, and Buenaventura mines.

SALT LAKE, UTAH.

Silver King Litigation.—Utah Copper.—Imlay Gold.

Among the mining engineers who have been brought into the suit pending between the Silver King Coalition Mining Co. and the Silver King Consolidated Mining Co. are H. Abbot Titcomb, of London, and Albert F. Holden, managing director of the United States Smelting, Refining & Mining Co. The Consolidated company claims that the Coalition has wrongfully extracted several million dollars' worth of ore from Consolidated ground, while the Coalition says that the ground in dispute is owned jointly and that the cost of extraction has been greater than the value of the metal taken out. The Coalition company has been sought by a number of purchasers, among whom are some of the large smelting people of the West, but the owners have refused all offers to date, though as much as $12,000,000 is said to have been offered at one time by the Guggenheims upon the recommendation of John Hays Hammond, who made a careful inspection of the ground several years ago. Since the completion of the merger between the Utah Copper and Boston Con., R. C. Gemmell has been made assistant general manager of the two companies. As soon as the Nevada Con. mine, smelter, mill, and Nevada Northern railroad are taken over by the Utah Copper, D. C. Jackling will have charge of all these properties. It is possible that later Ray Consolidated, Gila, and Chino, which are being operated under the personal direction of Mr. Jackling, will be taken into this merger. The Guggenheims have a large personal interest in these properties, and it is their desire to have all their Western properties owned by one corporation. It is understood that some of the smelting plants may also be incorporated in the copper concern, as under the present arrangements there are so many sub-committees as to interfere with the direction of the mines, mills, and smelters. Mr. Jackling is eminently fitted for this position as he has a wide experience in every branch of the business. Several years ago he was offered the management of Nevada Con. Morris P. Kirk, who has been superintendent of the Last Chance mine at Bingham, leaves for the Imlay gold mining properties this week. He has been in charge of the Nevada-Utah Mines corporation in Utah and Nevada for several years and is to take charge of the gold-producing properties in Humboldt county, Nevada. This company was forced to discontinue operations a couple of months ago, owing to the inability of the railroad to deliver coal. The company has a mill on the ground which is capable of reducing 300 tons of ore per day. The mill has only been operated at half capacity and a high recovery has been regularly made. The control is held by Salt Lake people and the plan of campaign includes extensive development. Some interesting data have been brought out regarding Boston Con. mill operations. It appears that while the company has been reducing upward of 3000 tons of ore daily no profits have been made. In explanation of this condition it is shown that while the mill has been making a satisfactory recovery, the volume of ore treated was not sufficient to place the property on a paying basis.

NEW YORK.

Mineral Development Co.—Braden Copper. — Arizona Copper. — Con. Arizona.—International.—Utah-Nevada Consolidated.

The annual meeting of the Mineral Development Co. was held this week at the company's office in New York. An interesting feature of the meeting was the announcement by the resident manager that the big shaft has reached a depth of 1643 ft. At this point the company begins to earn a subsidy from the Mexican Government of ₱150 for each metre gained in depth. The company is sinking to reach the dip of the Valenciana vein at Guanajuato, Mexico, and the subsidy accorded to the company is the only one of this nature ever granted by the Mexican Government. Theodore Dwight, formerly assistant secretary of the American Institute of Mining Engineers, was elected president, and Robert V. Norris, first vice-president. Pope Yeatman, chief consulting engineer for the Braden Copper Co., has gone to Chile, to make an exhaustive examination of the mines and reduction works. Barton Sewall, president of the company, says in a statement just issued, that the development during the past few weeks has been especially favorable. Ore of 4.11% copper tenor, has been developed by an adit 730 ft. below any previously opened ore. The company is bringing its mill capacity up to 2000 tons daily. He estimates that the copper will be produced at an average cost of 7c. per pound.

Members of a syndicate from Scotland, representing the owners of the Arizona Copper Co., among the number being John Gill, chairman of the company's board of directors, recently visited this country, and after some tentative negotiations with the Amalgamated Copper Co. regarding the sale of the Arizona to the Amalgamated interests, have returned home. It was reported that Phelps, Dodge & Co., Inc., had purchased the Arizona Copper Co., but this proved incorrect. The smelting plant of the Consolidated Arizona Smelting Co., at Humboldt, is to be doubled in size. The developments at the Blue Bell mine owned by the company and the contracts which have been made for handling the product of outside properties, are said to be sufficient to justify this step. It is stated on what appears to be good authority that the stock of the International Smelting & Refining Co. will be placed on a permanent 8% dividend basis at the meeting to be held next week. It is said, further, that the earnings are approximately 15% on the $10,000,000 outstanding stock.

The neutral stockholders of the Nevada Consolidated Copper Co. are about to declare a state of siege, owing to their continuous bombardment by the Utah Copper Co.'s representatives, soliciting the exchange of Nevada Con. shares for those of Utah Copper, alternating with equally emphatic advices from James Phillips, Jr., president of the Nevada Con., in opposition to such move. Mr. Phillips, in a letter issued today, says in part: "The stockholders of Nevada Con., having once exchanged their Nevada stock for Utah stock, must look to the Utah company for dividends. Under the conditions set forth in my previous letter the Utah company can not earn its proportion of dividends, compared with Nevada, on its increased capitalization, now $25,000,000." Mr. Phillips goes further and in a spirit of reminiscence not altogether kindly, recalls the Nipissing episode, with the reminder that that deal, with its attendant consequences, was like the present proposition, based upon the recommendations of Pope Yeatman and J. H. Hammond. Altogether the controversy has taken a decidedly acrimonious turn, which, in view of the present depressing conditions prevailing in the market, is much to be deplored. It is anticipated that North Butte's dividend will be cut to, perhaps, 50c. per share for the quarter. North Butte seems to have fallen into general disfavor. The shares have been selling around $35, against $90 a year ago. Dispatches received here state that the Tuolumne company which adjoins the North Butte, will, in all probability, make a claim against the latter for some $8,000,000 for ore that the North Butte is claimed to have taken from Tuolumne ground. It is also stated, though not generally credited, that the enlarged Anaconda Copper Co. is not to absorb North Butte.

General Mining News.

ARIZONA.

COCHISE COUNTY.

(Special Correspondence).—The shaft of the Arizona United Mining Co., at Johnson, is now down 825 ft., and has opened a good body of sulphide ore. The plant at present is treating 125 tons per day of carbonate ore from the upper levels producing about a carload of 45% copper matte per week. Both sulphide and carbonate ore assay well in silver and gold. The plant was erected by the Traylor Engineering Co., and is in charge of B. M. Snyder.——In Texas canyon, near Dragoon, a Joplin jig is being used to concentrate wolframite. The ore is reduced in a hand crusher and concentrates to a clean product.

Johnson, February 4.

The Copper Queen Consolidated Mining Co. is to drive a 500-ft. adit 400 ft. below the apex of Sacramento hill to prospect the ground near the surface. The orebody recently

Arizona United Mining Co.'s Smelter.

opened on the 400-ft. level of the Holbrook property has now been proved to be 90 ft. wide, the cross-cut having been extended to connect with the C and D drifts on the 450-ft. level.

GILA COUNTY.

(Special Correspondence).—Development on the 300-ft. level of the Live Oak mine is opening sulphide ore, the average copper content of the drifts sampled during the past week being 2.58%. Churn-drill work will begin as soon as the necessary equipment has arrived.——The Inspiration Copper Co. is installing a 60-hp. hoist at its Joe Bush shaft, where an 80-hp. boiler was recently set up. The bulk of the underground development work is being done on the 400-ft. level of the shaft, where the work of blocking out the orebody is in progress. The churn-drills are putting down holes No. 30 and 31, northwest and southwest from the Joe Bush shaft.——The third churn-drill is working on the Miami property about 200 ft. north of the Cordova Copper Co.'s northern boundary.——The Old Dominion smelter output for January was 2,130,000 lb. of copper. The accident at the A shaft, December 31, 1909, caused a slight decrease in the ore production for several days. Two furnaces are treating 600 tons of 6.5% ore per day at present.——A 2300-kw. electric generator is to be installed in the power-plant for the electric pumps below the twelfth level.

Globe, February 4.

MARICOPA COUNTY.

(Special Correspondence).—The Vulture Mines Co., operating the Vulture mine south of Wickenburg, is running the old 20-stamp mill, and erecting a new mill which is being equipped with twenty 1600-lb. stamps, amalgamating plates, and a cyanide plant, for the construction of which the D. D. Demarest Co., of San Francisco, has the contract. A. R. McKay, the superintendent, states that the new mill will be in operation by April 1. The mine is opened to a depth of 600 ft. on an incline, and the ore consists of gold-bearing quartz assaying $14 per ton, 80% of which can be recovered by amalgamation.——The Arizona Prospecting & Developing Co. is commencing operations on two groups of claims near the Vulture mine. Copper ore has been found on its Antler and gold ore on its Speculator group. Prospecting equipment has been installed and shaft-sinking is in progress. H. S. Le Compte and A. F. Simpson, stockholders in the company, are directing the work.

Wickenburg, February 5.

MOHAVE COUNTY.

Figures just compiled for the production of the Golconda mine in 1909 by John Boyle, the manager, show the proportions which zinc mining has assumed in Mohave county. From this mine alone there was shipped last year 7100 tons of ore netting $136,000. The ore averaged 46% zinc, making a total of 6,532,000 lb., as against 631,000 the preceding year. The Golconda is now shipping 900 tons of ore per month, and the management estimates a similar rate of production from the adjoining Tub mine where shipping is to be started in a few days.——Work is just starting in the Prosperity adit, which will cut the Golconda vein 165 ft. below the present level.——The C. O. D. mine, which has been idle for a number of years, is the latest of the old producers to resume operations. P. F. McLaughlin, of Goldfield, has associated himself with John Boyle, Jr., who has held an option on the property for some time, and is already on the ground for the preliminary work of cleaning up. A large quantity of lead-silver ore has been mined from the upper levels.

PIMA COUNTY.

(Special Correspondence).—The Pioneer Smelting Co., organized by L. S. Wheeler, W. C. Moore, and George A. Corwin, of New York, and J. A. Highland, of Boston, is preparing to erect a copper smelting plant of 300 tons capacity on a site near the Gould mine, 18 miles west from Tucson. The equipment has been ordered from the Colorado Iron Works, of Denver, and Mr. Wheeler thinks that the furnace will be ready to blow-in by July. When operations are started the Gould mine is expected to supply most of the ore which is said to consist of sulphide running over 3% copper. Other properties in that district are expected to supply some ore later. A. L. Waters is to have charge of the construction and operation of the plant.

Tucson, February 5.

YAVAPAI COUNTY.

Two cross-cuts are being driven on the 700-ft. level of the Haynes Copper Co.'s property at Jerome. These total 950 ft. and have opened several veins with a fair amount of gold and silver, and a small percentage of copper. T. E. Campbell is manager.——The Mint Gold Mining Co., operating in Copper basin, has started a new double-compartment shaft and will install an electric hoist and erect a 30-ton mill this spring. Considerable ore has been blocked out on the 100-ft. level from the old shaft. The company will obtain its power from the plant of the Arizona Power Co. on Fossil creek. George W. Montgomery is manager.——The Golden Ridge Mining & Milling Co., operating southwest of Prescott, has completed new living quarters for the men and are to install a 4-drill compressor. Ell S. Perkins is manager.——An Indiana syndicate has secured 100 acres of placer ground in the Big Bug district from T. F. Averill and will commence operations this spring by installing a pumping plant on Big Bug creek to force water to the ground, where the gravel will be drawn to the sluices by large scrapers.

CALIFORNIA.

CALAVERAS COUNTY.

The ditch at the I. X. L. mine that furnishes water for power to operate the pumps is being repaired and it is understood that work will be resumed at the property.——The lower adit at the Montana mine is being extended to open the ore worked in the upper levels.——Operations have been resumed at the Del Monte mine, near Mokelumne Hill. The mill is run when enough ore has been taken out to operate for several days.——The mill at the Easy Bird has been started and work resumed in the mine.——The workings at the Queen mine are being retimbered and the mill will be started in a few days. C. C. Allen is superintendent.——New machinery is to be installed at the old McPherson mine near Mountain Ranch and operations re-

sumed as soon as the roads are in good condition for hauling.

MARIPOSA COUNTY.

The Long Mary mine has been unwatered to the 300-ft. level and the mill is being run one shift.——The company is to sink the shaft at the Mount Gaines property another 100 ft. and has laid off 40 men till that work is completed and another level opened.——The force at the Ruth Pierce has been increased and the mine will be operated on a larger scale.——The Mariposa mill is crushing ore for W. E. Paine and J. N. Turner.

NEVADA COUNTY.

New equipment has been ordered for the Mountaineer property in the Nevada City district and the raise from the 700 to the 400-ft. levels will be started as soon as this reaches the mine. The first section of the shaft from the 400-ft. level to the surface has been timbered and the foundations for the new hoist and pumping plant are finished. ——The bedrock adit at the Blue Lead mine, at Relief, is now under the middle of the channel and a raise is to be driven to open the gravel. J. O. Jones is operating the property.——At the Champion a number of lessees are at work and the pipe line is being repaired to commence pumping at the 1800-ft. level. There are 20 stamps dropping in the mill.——The pumps at the Canada Hill have been running for the past two weeks and D. M. Stevenson, who is operating the property under bond, expects to have the mine unwatered in about five weeks.

PLACER COUNTY.

Operations are to be resumed at the Gold Blossom mine in the Ophir district shortly as the property has been bonded to an Eastern syndicate.——The wires of the Pacific Gas & Electric Co. have been strung to the Orpheum mine and the mill and pumps are being operated by electric power.——New machinery is being installed at the Spring Garden property.——Operations have been resumed at the Yankee Jim property under the management of Thomas Browne. A raise is to be driven to open the channel.

SAN BERNARDINO COUNTY.

(Special Correspondence).—Telluride ore has been found at a depth of 148 ft. in the Green mine, in the Slate Range district. The orebody is reported to be over a foot wide and assays as high as $1000 per ton. Nicholas C. Green is manager.——The Helen property, near Tecopa, reports the uncovering of a 12-ft. body of silver-lead-gold ore worth $36 per ton.——The California Hills Co. continues active development. Good assays are reported from several points.

San Bernardino, February 7.

SHASTA COUNTY.

W. W. Robinson, who is opening the old Climax mine near Igo, has let a contract to sink the shaft 300 ft. and will install a 50-ton cyanide plant if the ore at the lower level is equal in value to that taken from the upper workings.——A second shipment of 50 tons of silver ore was recently made from the Rogers mine on Andrews creek to the Kennett smelter.——The Evening Star mine, in the Old Diggings district, has been purchased by George Bayha, representing German capitalists, and a cash payment of $15,000 has been made. The mine has been operated for the past 15 years, regular shipments being made to the smelters. It was equipped last year with a powerful electric hoist.——Rufus Hall has secured a lease on the property of the Glenn County Mining Co. on Dog creek, and is arranging to send the ore to the Balaklala smelter.——The blast-furnace at the Bully Hill plant at Winthrop has been shut down to install a new water-jacket.

SIERRA COUNTY.

W. J. Smith, of Vorden, has obtained a bond on the Empire mine in Gold valley.——The Wisconsin gravel mine near Forest City has been bonded and operations resumed under the management of Joseph Kelly. There are 300 acres in the property and a rich channel has been worked up to both ends of the ground.——The second raise that was put up at the White Bear mine reached gravel at the height of a little over 40 ft. The rock near the gravel was very soft and swelled badly and the raise had to be abandoned without much prospecting. The gravel that was taken out was washed and contained fine gold, but it is supposed this raise was also put up in the rim. The main adit will now be extended for some distance before another raise is put up.

TUOLUMNE COUNTY.

(Special Correspondence).—The Draper mine is at present working with a smaller crew than usual, but it is said more men will be put on before long. The outlook for the property is reported to be encouraging.——Preparations are being made for the complete resumption of operations at the Dutch mine. The mill is being thoroughly overhauled and repaired and will be started within a few days. Development work is being energetically carried on with a crew of 15 men.——For several weeks past nothing but development work has been done at the Mohican mine, but when wood can be hauled over the road leading to the property complete operations will be resumed. Good orebodies have been opened, making certain a steady run of the mill for a long time.——A 4-ft. vein of high-grade ore has been uncovered on the McGuire & Browning claim, which is situated between the Mohican and Ellen Winton mines.——A rich discovery was made a few days ago on the 1300-ft. level of the App mine, where an orebody believed to be the old App vein which was lost on the 1100-ft. level, was uncovered. The ore assays from $5 to $25 per ton.

Tuolumne, February 7.

A 4-ft. vein has been opened by the adit at the San Juan property at Big Oak Flat.——The mill at the Black Oak has been started on ore from the upper levels and the water is being drained from the lower portion of the mine.——The shaft at the Mack mine is down 700 ft. and drifts are being driven on the 600 and 700-ft. levels. The 20-stamp mill is running steadily. Mathew Jacobs is superintendent. ——The mill at the Keitz mine is being overhauled and will be started this spring. Some rich ore has been opened recently.——Operations have been temporarily suspended at the Republican property.——The Southern Mines Exploration Co. is to start its plant in March.

COLORADO.

CLEAR CREEK COUNTY.

(Special Correspondence).—A shipment of 43 tons of lead-zinc ore from the Gambetta mine to the Linn mill that was made last week concentrated to 31 tons of 54% zinc and 2 tons of 62% lead. B. J. O'Connell, the operator, is sending out a 50-ton shipment of zinc ore that will mill better than 50% in that metal.——A 10-in. streak of silver ore has just been opened in a winze from the southwest drift on the Anamosa vein which assays as high as 1800 oz. silver per ton. O. W. Mann is manager.——An 8-in. streak of galena has been uncovered in the west drift on the Baltic vein operated through the Raymond adit. The ore assays 2 oz. gold and 35 oz. silver per ton, with 7% copper and 40% lead. J. Raymond is manager.

Georgetown, February 5.

(Special Correspondence).—A rich body of ore has been uncovered in the Treasure Vault mine and shipments have been started. A test lot of 2382 lb. sent to the sampler at Georgetown was settled for on the basis of 10.6 oz. gold and 2.4 oz. silver per ton. Another test of 280 lb. assayed 16 oz. gold and 1.05 oz. silver per ton. Six sets of lessees are at work and all are breaking pay-ore. John Ward is the owner.——The Jackson mill has again been put in operation after a close-down of several weeks occasioned by the freezing of the pipe line.——Denver people have secured a bond and lease on the Refugee mine on Bellevue mountain. Work was put under way last week.——Work has been resumed on the Arizona mine by George Ford and associates.

Idaho Springs, February 5.

GILPIN COUNTY.

(Special Correspondence).—Semmens & Co., operating the Parole mine in the Nevada district, are sending out heavy shipments of milling ore to the Black Hawk custom mills.——Visintini & Co., leasing on the 150-ft. level of the Puzzle mine in the Nevada district, are following an 8-in. streak of smelting ore. A shipment of nine tons that was

made last week assayed $223 gold per ton.——The shaft on the Rockford mine, in Russell district, is now down 230 ft. Drifts are to be started east and west and the shaft will be sunk to the 400-ft. level. H. F. Lowe is the owner.——An average of three carloads per week of smelting ore is being sent out by Ress & Co., leasing on the Iron mine. The ore is sent to the Modern smelter at Utah Junction and average returns of 6 oz. gold per ton are being realized.——A gold retort weighing 97 oz. was sold last week by the Fifty Gold Mining Co. to the Rocky Mountain National Bank. This was taken off the plates at the mill in two weeks.

Central City, February 4.

LAKE COUNTY.

A company of Leadville men have secured a lease on the Silver Nugget, Alice, Enterprise, and adjoining claims, southwest of the Garbutt. It is the intention to sink a 3-compartment shaft 750 to 800 ft. and from the bottom prospecting will be carried on to open the ore-shoot of the Garbutt. It is understood that the work will be started early in March.——At the Stone, Dome, and La Plata, lessees are shipping steadily an average of 20 tons per day from each of the claims, and at the same time development work is being pushed steadily ahead. The ore that is being hoisted is a sulphide with considerable carbonate which assays high in lead. Most of the work on the claims is being done at the 300-ft. level. All of the ore is hauled to the Yak switch.——From the lower level of the A. Y. & Minnie a winze is now down 70 ft., and has been sunk in ore the whole distance. It is probable that the shaft will be sunk another 200 ft. to develop the orebody now being opened by the winze.

SUMMIT COUNTY.

The shaft at the International property, near Robinson, has opened the Robinson vein and two carloads of ore per day are being shipped. The work of overhauling the mill is nearly completed and in a short time the plant will be in operation and the company shipping concentrate.——There were 125 cars of ore shipped from the Wintergreen mine during 1909 and preparations are being made to increase the output this year. William Lindsay is operating the property.——Peter W. Breene is opening the Reconstruction group on Copper mountain.

TELLER COUNTY.

The Western Investment Co., of Victor, holding a lease on 65 acres situated at the west end of Isabella Mines Co.'s Bull hill property, reports a rich find made in the workings of the Empire State shaft, on the Orphan Belle group of the company's holdings. The discovery was made in a raise between the 600 and 500-ft. levels.——Shipments have been resumed from the Conundrum mine on Gold Hill, owned by the Ethel Louise Gold Mining Co., and operated under lease by S. A. Worcester, of Victor.——Ore assaying $62,000 per ton has been opened at a depth of 1376 ft. in the Ruble mine on Bull hill operated by the Rubie Mining & Leasing Co.——Official announcement has been made by John T. Milliken, president of the Golden Cycle Mining & Milling Co., that an option has been granted to an English syndicate on the stock of the company, the option running until February 28. The corporation has already made examination of the property which includes the Golden Cycle mine at Victor, one of the heaviest producers of the Cripple Creek district, the mill in Colorado Springs, and the extensive coal lands east and north of Colorado Springs.

M. B. Rapp, who recently secured a lease on the south end of the Dante mine on Bull hill, formerly operated by the British American Mining Co., has opened a new orebody at the 500-ft. level of the No. 2 shaft. The pay-streak is between 2½ and 3 ft. wide, and the ore will ship at about $30 per ton.——The annual report of F. J. Campbell, general manager for the Vindicator Consolidated Gold Mining Co., recently mailed the stockholders shows a net production for 1909 of 31,664 tons of the value of $895,847.60. Of this amount freight and treatment charges totalled $228,810.32 and the total mine expenses $321,632.26. Lessees were paid $213,351.46 and the gross profit from mining was $132,053.65. The development work during the year measured 8000 ft. and the total length of the bodies developed was 1954 ft. Dividends were paid during the year amounting to $112,500 and the cash remaining in the treasury on January 1, was $92,358.03. The company paid its first quarterly dividend for 1910 on January 25, amounting to $45,000.——The Portland Gold Mining Co. paid a dividend of 2c. per share totaling $60,000, and bringing the January dividends of the Cripple Creek district up to $105,000.——The Pharmacist Consolidated Gold Mining Co. paid a $7500 dividend on February 1.——The plants treating Cripple Creek ore give the following figures for ore treated in January:

Plants.	Tons.	Average Value.	Gross Value.
Golden Cycle Mill	25,500	$20.20	$515,100.00
U. S. R. & R. Co.	12,500	22.00	275,000.00
Portland Mill	9,000	20.00	180,000.00
Smelters, Denver & Pueblo	4,500	65.00	292,500.00
Isabella Mines Mill	3,100	3.40	10,440.00
Trilby Mines Mill	1,350	6.00	8,100.00
Blue Flag Mill	1,240	6.00	7,440.00
Wild Horse Mill	1,500	4.00	6,000.00
Gaylord Mill	1,274	4.60	5,860.40
	59,964	$21.68	$1,300,440.40

MISSOURI.

JASPER COUNTY.

(Special Correspondence).—Several unusually important sales have been consummated in this district during the past few weeks. The largest made for some years was the sale of the John Jackson tract of 400 acres, lying near the Chitwood camp, for a consideration of $250,000. A portion of this land has been mined for some time producing in all about $2,000,000 from 65 acres.——Another important sale was that of the Young tract of 320 acres southeast of Joplin to Frank Creller. Several other smaller tracts northwest of the city were included in the purchase. The larger tract has been prospected and a number of shallow shafts are in ore. The land is being laid off in lots some of which will be sub-leased.——Shelton, Bayless & Co. are sinking a second shaft on the Guinn land north of Webb City, and are planning the erection of a mill. The work on the lease was started by the Grace company who abandoned the lease when the shaft was not far above the ore-level and the work was completed by the present company. The orebody is found at 180 ft.——S. Y. Ramage is planning the erection of another mill on his lease of the Morgan forty on the Center Creek land. Two shafts are already in ore and are supplying the mill. The lease is well blocked out with drill-holes showing ore at 150 ft. The new plant will be of 300-tons capacity.——The Henderson-McDonald company has bought the South Portland mill for $7000, and is removing it to the old Troupe land where the present company is interested. This land has been extensively exploited and was considered worked out, but the present company has found good ore in the old working and has tapped the old drifts at 175 ft.——Malone Brothers, operating on the old Boston Get There land at Prosperity, have just completed the removing of the old American Beauty mill from a lease at Duenweg to the new tract. It has a capacity of 300 tons per day. This old tract was mined at the upper levels several years ago quite extensively, but the sheet-ore levels have never been opened. Work has been started in the old shaft which opened 7% ore.——Among the good discoveries of the past fortnight may be mentioned one in the Carthage camp, on the Ben Mevey land, made by Chitwood & Mooneyham. The best ore, as shown by the drilling, occurs at 180 ft., and consists of zinc and lead. As soon as the shaft reaches the ore-level and drifts are run, a concentrating plant will be erected.——The Peacock Valley Mining Co. has made an excellent find of lead ore in the Carterville camp. The drill-clippings are rich, showing the deposit from 175 to 190 ft. There is no trace of zinc blende.—Starr & Meece are opening a rich mine west of Joplin in the sheet-ground area, the ore being found at 170 ft. In all 11 drill-holes have been put down, 10 of which show ore. Two runs of varying thickness are shown, the upper at 146 ft. which is separated from

the lower at 172 by a thin rib of barren rock. The ore is being piled up awaiting the erection of a concentrating plant.

Joplin, January 29.

MONTANA.

LINCOLN COUNTY.

The Silver Cable mine, in the Cabinet mountains, has been bonded to J. H. Town for two years. There are five claims in the group which have been opened by over 2000 ft. of development work disclosing several bodies of ore. A 50-ton concentrator, offices, and living quarters have been erected on the property and a road built to Libby, a distance of 23 miles. Development will be continued till the weather moderates and then additional machinery will be installed and work started on a large scale.

NEVADA.

ESMERALDA COUNTY.

Two blocks which have heretofore been reserved by the Atlanta are included in a lease just granted to the Queen Consolidated Mines Co., with headquarters at Milwaukee. The lease stipulates that the shaft be sunk at once to 750 ft. The same company has ordered hoisting equipment for its Queen shaft, three miles east. The Garrison lease on the Atlanta is cross-cutting at the 750-ft. level, the Maloney is driving for the Clermont vein at 700 ft., the La Manse is installing new machinery to sink deeper, and J. A. Houlahan is operating the Matilda, Century, Imperial, and Brooklyn leases, all on the Atlanta. Ford and MacKay are taking good ore from the original St. Ives workings, the last shipment running $63 per ton, and in a few days will begin stoping on the 350-ft. level. Four men are now employed in breaking ore. On the Booth, a cross-cut is being driven at the 150-ft. level from the Banner shaft to cut the Red Top vein near the boundary line and is close to the vein. The Grand Central group of claims, adjoining the Great Western at Hornsilver, south of Goldfield, has been sold to D. Mackenzie. They were located in 1872, and from two shallow shafts a quantity of high-grade ore was shipped overland. A force of miners is now cleaning out the old workings and retimbering.

LINCOLN COUNTY.

The raise for the shaft at the Pioche Metals property in the Pioche district has been completed and a gasoline-hoist is being installed. The raise was driven 236 ft. to the surface and sinking will now be continued. David Lemmon is superintendent.

LYON COUNTY.

The Mason Valley Mines Co., operating in the Yerington district, is to be partly reorganized. The present capital of the company is 1,000,000 shares, par $1. This is to be changed to 200,000 shares, par $5, and a bond issue of $1,000,000 is to be made and offered to the stockholders at par; one-half of the proceeds to be used in the erection of a smelter to handle the company's ores and to do custom work as well; the balance of the money to be placed in the treasury. The engineers estimate the ores already developed at about 600,000 tons, averaging 3% copper.

NYE COUNTY.

(Special Correspondence).—The winze 300 ft. south of the shaft on the 400-ft. level of the Midway has broken into a body of ore assaying from $12 to $20 per ton. The vein has been opened for 20 ft. with no indication of the opposite wall and a cross-cut is being run from the 600-ft. level to intersect the new vein at that point.——The vein on the 1100-ft. level of the Belmont has widened to 10 ft., the ore assaying about $40 per ton. The drift has been driven for a distance of 165 ft. and preparations are under way to resume the sinking of the shaft. About 650 tons per week is being sent to the smelters.——The Ruth lease, on Manhattan Dexter, has sacked 100 tons of $40 ore.——The Pioneer lease reports the opening of a body of ore on the 150-ft. level that assays from $100 to $150 per ton. The vein is said to be several feet wide.——The Chloride Cliff Mining Co., at Rhyolite, has opened a body of ore assaying about $30 per ton, and is reported to be considering the installation of a small mill.——The Mushett lease, on Manhattan Earl, has installed a 20-hp. hoist and will sink a new shaft to intersect a vein uncovered on the Forman fraction claim. It is 11 ft. wide and assays about $30 per ton.——The Swanson lease on the Earl mine has opened $40 ore on the 200-ft. level. The shaft is being sunk to the 250-ft. point.

Tonopah, February 4.

STOREY COUNTY.

Work has been resumed in the winze the Charles Butters Co. is sinking at the 280-ft. level of the Potosi and will be continued to a depth of 150 ft. Preliminary work has been started on the Monte Cristo property recently purchased by that company and a head-frame and surface buildings will soon be erected.——The Comstock-Mohawk Co. has made the final payment of $5500 on the Conlan group of claims on the Brunswick lode. The company has had an option on these claims for the past year, and is preparing to open them on a large scale. At a meeting of the Comstock Pumping Association $10,000 was appropriated from the treasury to go toward the cost of an additional pump for the 2100-ft. level of the Ward shaft to be used in assisting in the drainage of the Gold hill mines. The Yellow Jacket, Crown Point, and Belcher companies of that group have consented to pay a pro rata of the expense of pumping. A committee will confer with the managers of the other Gold hill mines and endeavor to secure their cooperation in the drainage of the south end of the lode. This action means the drainage of the Gold hill properties some 400 ft. below the present water-level.

WHITE PINE COUNTY.

The northeast cross-cut on the 55-ft. level of the Ely Centennial has opened a body of ore that assays over 5% copper, with a small amount of gold and silver.——Three shovels are clearing the overburden on Copper flat, and two loading ore for the smelter. There has been considerable snow which has hindered operations both at the mine and concentrator.——At the Giroux the shaft is being retimbered to the 1000-ft. level and sinking continued from that point.

NEW MEXICO.

SIERRA COUNTY.

(Special Correspondence).—No. 1 shaft at the U. S. Treasury is nearing the 200 and will be continued to the 300-ft. point. A station will be cut at the 200-ft. level and drifts extended to cut the shoot opened at the 108-ft. point. From the 300-ft. station a drift will be extended to connect with the White Eagle shaft. Recent developments above the 100-ft. level have opened a large body of ore that assays from $10 to $12 per ton. It is expected to erect reduction works before the end of the year. Willis G. Moore is consulting engineer.——New machinery, including a crusher, boilers, and engine, is being installed at the Keystone. Good ore has been opened, the principal orebody being several feet wide and assaying as high as $100 per ton. Byron L. Morrison, of Colorado Springs, is operating the property under a lease.——At the Eureka two adits are being driven. The upper one is in 50 ft. on a lime and porphyry contact. Several sacks of $75 ore will soon be shipped.——Shipping ore is being sacked at the Gold Reserve. Development is progressing steadily.——At the Polar Star the 90-ft. shaft has opened a promising body of ore. Assays are reported to run about $100 per ton. A steam-hoist, compressor, and other machinery will be installed shortly.

Chloride, February 5.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The Star mill of the Homestake company at Lead has been started adding 200 stamps to those already dropping. The Highland hoist and Old Abe are running now, supplying ore to the mills. Non-union men are being imported from other camps to operate the properties.

UTAH.

SALT LAKE COUNTY.

The cross-cut on the lowest level of the Butler-Liberal portion of the North Utah Mining Co.'s property has opened two feet of galena ore. The company is now mining ore in four parts of the mine, the stope on the 235-ft. level having recently broken into ore containing a high percentage of

gold and silver. W. D. Bohm is manager.——The south drift in the Utah-Apex has been in rich ore for the last 150 ft., and from its strike it is thought that it will unite with the famous Dana fissure. The ore reserves have increased so much lately that the company is planning on erecting a plant that will have a capacity of 500 tons per day.

Map of Utah.

CANADA.

BRITISH COLUMBIA.

(Special Correspondence).—The cross-cutting operations on the 1300-ft. level of the Josie mine, in the Rossland district, are making good headway.——The orebody being worked on the 1200-ft. level of the Idaho claim of the Consolidated group is opening up in a promising manner and work on the Iron Mask, Centre Star, and War Eagle mines of the same company is being carried on with good results. The usual tonnage being sent to the Trail smelter each week.——The Mayflower mine in the south belt has been leased to N. Hansen and a force of five men put to work. A chute is being built from No. 3 adit to the track. A good body of ore has been opened.——At the Van Roi, near Nelson, a crew of over 100 men is now employed and the milling operations average 150 tons per day.——The Silverton Mines, Ltd., is working the Hewitt & Lorna Doone property. Three drifts are being driven on the several veins that traverse the property and will open much new ground. The Molly Hughes shipped 59 tons of ore last week containing a quantity of native silver.——The Lucky Jim mine has closed down on account of inclement weather, which has been interfering with shipments.——The Rambler-Cariboo property is keeping up a steady output and some good shipping ore has lately been opened in the lower levels.——A party of French capitalists, who are interested in the Canadian Metal Co., operating the Blue Bell mine at Riondel, visited the property of the company during the past week. Since the reorganization of the company last year its financial affairs have improved and the work at the Blue Bell has given good results. About 900 tons of zinc ore per week is now milled, and it is hoped that the result of the visit will be the doubling of the present output. An improved form of reduction is planned at Riondel, and if present plans carry, the additional works will be put in at an early moment. There is a large deposit of zinc ore awaiting treatment on the company's property.——In connection with the proposed high-voltage power line for the Sheep Creek-Ymir district, it is now stated that the men owning the water-right in the gorge of the Pend d'Oreille, near its confluence with the Columbia, will shortly commence development.——In the face of a 380-ft. adit at the old North Star mine a large body of ore containing about 60 oz. silver per ton and 40% lead has been pierced. Driving and sinking are now in progress to ascertain the value and extent of the deposit.——Work is being rapidly put under way at the Sullivan mine and shipments will soon be started to the Consolidated smelter.——In the adit, on the Cosavello property at Moyie, a gold-bearing quartz vein has been cut 130 ft. from the portal, assaying as high as $60 gold per ton.

Rossland, February 5.

ONTARIO.

The output from the Cobalt district for January, 1910, was greater by 400 tons than for the same month in 1909. The Colonial is again on the shipping list after a year of idleness.——The annual report of the Hargraves Mining Co. states that all litigation has been settled, a 6-in. vein opened on the 372-ft. level, and 12 cars of ore shipped per day.——The shaft at the Temiskaming is down 420 ft. and has cut through the main vein although the ore at the bottom is of good milling grade. A station is now being cut at the 400-ft. level and a cross-cut will be driven to the ore. Two winzes are down over 50 ft. each on the No. 3 vein at the 300-ft. level. There is enough ore on the dump to supply the 100-ton mill for a year and enough above the 300-ft. level to keep the plant busy two years.——A carload of high-grade ore was shipped from the drift on the Little Nipissing property to the O'Brien smelter at Deloro.——A second shipment of 30 tons of high-grade ore from the Reeves-Dobie mine at Gowganda has been forwarded to the reduction plants. A. J. Dignum is managing director. The Boid-Gordon and Mann mines in the same district are preparing to ship.

MEXICO.

MEXICO.

(Special Correspondence).—The Seguranza Mining Co. has constructed a new road to Naranjo, on the Mexican Central railway, passing to the west of Taxco, by way of Teneria, Cruz de la Virgin and Tecalpulco, thus reducing the distance between the mines and the railway to eight hours' travel. Electric air-drills have been received by the Seguranza company and are giving entirely satisfactory results. A contract has been let for driving the main drift north on the Zaragoza level to make connection with the El Bobo level. High-grade ore has recently been found in the old workings of the Escorpion mine, which lies between the Coronas and El Bobo. Large bodies of milling ore have also been found in the Ampliacion de Olvidado, recently purchased, and lying to the north and west of its other properties.——In the San Fernando mine, famous in the past for its large production, a body of high-grade ore was recently discovered. The limits have not yet been determined. The company has contracted with the Toluca Electric Light & Power Co. for 50 hp. for the purpose of running drills, hoists, and fans for ventilation. This is one of the oldest and most productive mines of the district and is under the direction of Angel de Caso.——The town of Zacualpan is now lighted by electricity, a branch line having been constructed from the power station at the Coronas mines.——E. G. Stackpool, formerly of Taxco, is here for the purpose of making an examination of the Cuchara mine and mill. The Cuchara mill, with the exception of a few minor changes, is understood to be giving entirely satisfactory results, and the plant will soon be working to its full capacity of 50 tons per day. The mine has an ample supply of ore in reserve and is carrying on development on a large scale.——The Concepción Mining Co., recently organized, is producing good ore and is negotiating for electric power.——The Santa Cristina Mining Co. has started an adit on the south end of its property, with a view to reaching the junction of the main vein with the veins of the Maraqüita property which lies to the north of it. This property is being operated by H. C. Reeche and associates, of Dubuque.

Zacualpan, February 4.

Personal.

Professional men are invited to send news of their engagements and travels. Such news is interesting to friends.

J. E. TAFF has gone to Coalinga.

E. H. NUTTER has gone to London.

G. S. RICE is at Primero, Colorado.

ALBERT ROBERTS is in San Francisco.

J. PARKE CHANNING is at Globe, Arizona.

F. L. RANSOME has been at Globe, Arizona.

E. B. KIRBY was in San Francisco this week.

HORACE G. NICHOLS has left London for the Rand.

HENAY HANSON was in San Francisco Wednesday.

S. F. SHAW is returning to New York from Costa Rica.

OTTO SUSSMANN was at Globe and Ray, Arizona, last week.

PERCY S. RYDER, formerly of Colorado, is at Tucson, Arizona.

H. W. HARDINGE is now at Cobalt, Ontario, on professional work.

H. W. TUANER has gone to Midway, Kern county, California.

WILLIAM KEMP, of Tucson, visited Yuma county, Arizona, recently.

PHILIP WISEMAN, of Los Angeles, was in Tucson, Arizona, recently.

J. V. N. DORR, of Denver, is expected soon at Wickenburg, Arizona.

E. W. BROOKS, of Los Angeles, was at Winkelman, Arizona, recently.

HENAY KRUMB, of Salt Lake, was at Troy and Ray, Arizona, last week.

HUGH ROSE has been appointed general manager for the Santa Gertrúdis.

R. P. COLEMAN, of Salt Lake City, was in Yuma county, Arizona, last week.

E. M. STEWART is mine superintendent for the Ray Con. Copper Co., of Arizona.

T. H. JENKS is examining properties in Gunnison county, Colorado, for Boston clients.

F. H. NETTLETON, engineer for the Flynn Exploration Co., was at Ray, Arizona, last week.

REIJI KANDA has returned to Japan from Korea and will leave for London early in March.

W. E. DEFTY, of Phoenix, Arizona, expects to go into Sonora, Mexico, on professional work this month.

FREDERICK H. MORLEY has left Denver for Hermosillo, Mexico, where he will be busy for several months.

HALLET R. ROBBINS, of Seattle, is at Denver after having spent several weeks at Boston on professional business.

R. B. MCGINNIS, with the Chicago Exploration Co., was in San Francisco last week on his way to La Dura, Sonora, Mexico.

FRED BURNS, recently with the South American Mines Development Co. of Ecuador, is now superintendent for the Guanajuato Con. M. & M. Co., at Guanajuato, Mexico.

MARKET CONDITIONS in New York the past week have been exceedingly unsatisfactory. The atmosphere is one of intense strain, and it is evident that at least for the present all the larger plans, which the leaders have made for market campaigns, must be laid aside. Copper metal has been slightly firmer in the face of generally unsatisfactory conditions. Electrolytic copper is quoted a trifle below 13¾c. for April delivery, but the larger agencies will sell no copper at this figure and such sales as have been made are only odd lots that do not affect the situation. The position of the stronger factors in the metal market is based on the belief that the Producer's Association's figures for January will show a decrease of at least 30,000,000 lb. in the accumulated surplus.

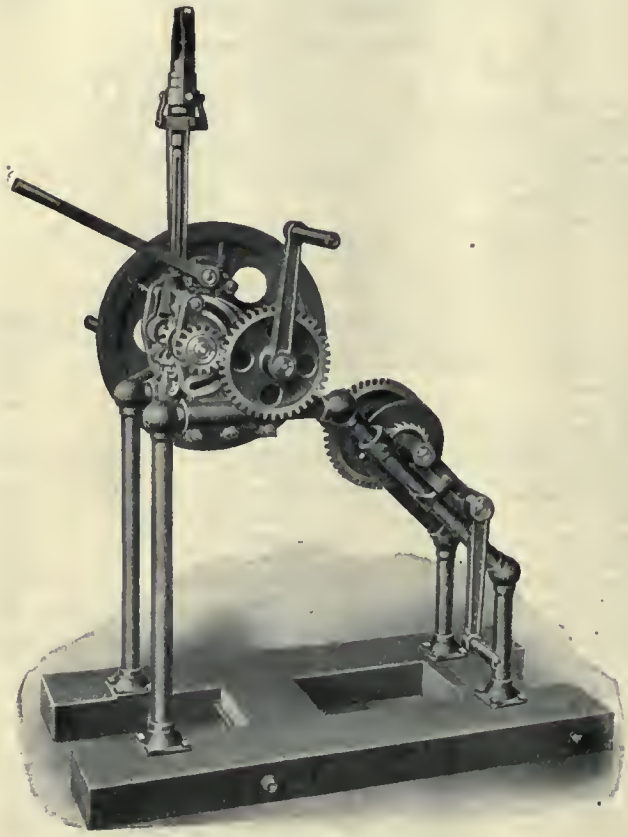
Prospecting Core-Drill.

The Terry Core Drill Co., 50 Church street, New York City, has recently placed on the market a hand-power core-drill which is designed for prospecting, foundation testing, and for making wash borings. To determine, without washing, the character of soils or mineralized sand, special tools are provided with which 'dry samples' can be obtained. This method of testing, particularly in placer deposits, is important, as the exact formation can at once be determined, whereas, by the washing process, the heavy or mineralized particles will not always wash to the surface. The maker claims that the design of this drill is unique, as it has been equipped with a fly wheel, which insures a uniform speed of the drill tools with the least exertion. This is an improvement which has not previously been taken advantage of in hand-power drills. The drill has unusually long bearings for the spindle, a feature of all the drills designed by this company. These long bearings impart a



steady motion to the drill-rods, and prevents their lashing in the bore-hole, thereby avoiding unnecessary breakage of the cores, increasing the speed of drilling and the percentage of core which is recovered. The capacity of the drill is 300 ft., to which depth it will bore a 2¼-in. hole, cutting a 1¼-in. core. Either diamond or shot-tools can be used. For mountainous countries, inaccessible to larger apparatus, and where fuel is difficult to obtain, it is particularly adapted. The shipping weight is 415 lb., and the fly-wheel, the heaviest single piece, weighs 73 lb. When knocked down it may be readily transported from place to place, and can be quickly assembled for operation. The drill-driving shaft is provided with change gears, so that fast or slow speed may be obtained, according to the character of the material to be drilled. The head swivels to any angle, and can be moved back on its frame to clear the bore-hole when raising or lowering the drill-rods or when casing is being driven. A sensitive feeding device is used, which consists of a double drum with ropes extending to the water-swivel and to which pressure is applied by a lever with a ratchet and pawl. Mounted on the rear of the drill-frame is a hand-hoist used for raising or lowering the drill-rods and for driving casing through soil to bedrock. The frame, supporting both the drill-head and hoist, is of seamless cold-drawn tubing, light in weight, yet of sufficient strength to withstand the heaviest load which may be placed upon it for its rated capacity. Cut gears and phosphor-bronze bearings are employed throughout, and all working parts are carefully and accurately machined so that friction is reduced to the minimum. A hand force-pump is used, which supplies water to the bore-hole. For drilling operations more extensive than a hand machine is capable of undertaking, and when portability is essential to the work, a power attachment can be applied to this drill by substituting a pulley for the fly-wheel and a counter-shaft with a friction clutch to control the power. When so arranged it can be driven with steam, gasoline, or horse-power. The friction clutch is advantageous when a gasoline engine is used, as it eliminates the annoyance of stopping and starting the engine when the drill may be momentarily stopped. When equipped to operate with power it is capable of boring a 2¼-in. hole to the depth of 400 feet.

Commercial Paragraphs.

Forbach & Newitt have established the Tucson Assaying & Engineering Co., at Tucson, Arizona.

The Sullivan Machinery Co. announces the removal of its New York City office from 42 Broadway to 30 Church street.

The Atlantic Equipment Co. has opened a branch office at 2101 Beaver avenue, Pittsburg, Pa. H. Kleinhaus is in charge.

Harold Baxter, who has opened a mining engineer's office at Phoenix, will make a specialty of directing mine development in Arizona.

The Hammond Iron Works, Warren, Pa., is distributing some convenient vest-pocket memorandum books in both an English and a Spanish edition.

The Galligher Machinery Co., Salt Lake City, Utah, is distributing an atlas of the world. It contains interesting illustrations of the company's plant, in addition to a complete set of maps.

The Bucyrus Co., South Milwaukee, Wis., advises that within the last few weeks it has received orders for two 13½-ft. dredges for California, one 8½-ft. dredge for South America, one 8½-ft. dredge for India, and one 3½-ft. dredge for Alaska.

George W. Myers, San Francisco, has recently put the 'Ideal' stamp stem guide on the market. It is a renewable metal guide requiring no loosening of bolts for removing one or all of the stems. A distinctive feature of this device is a double reverse taper on the guide bushings causing secure locking of the latter when dropped into the sockets of the frame. Mr. Myers, the patentee and manufacturer, advises that the Ideal guide is meeting with general approval in old as well as new mills and that its sale is constantly increasing.

Catalogues Received.

The Mulconroy Co., 723 Arch street, Philadelphia. Catalogue No. 20, '7-League sewed leather soled rubber boots'. Sent to any address. Illustrated, 3½ by 6 inches, 12 pages.

The United Iron Works, Oakland, Cal., Folder 35. 'The Tadmor Quartz Mill', an illustrated description of this new and interesting device for the fine grinding of ore. 6 by 9½ inches. 18 pages.

American Spiral Pipe Works, Chicago, Ill. Pamphlet No. 30. Showing spiral riveted pipe, forged steel pipe flanges, hydraulic and exhaust steam supplies. Illustrated, 8 by 10 inches, 24 pages.

The International Steam Pump Co. Bulletin W-175. 'Worthington Turbine Pumps'. Illustrated, 6 by 9 inches, 32 pages. Bulletin W-176. 'Type 'D' Centrifugal Pumps'. Illustrated, 6 by 9 inches, 12 pages.

Sullivan Machinery Co., Chicago. Bulletin No. 56 B. Automatic slide valve hoisting engines for mines. Illustrated, 6 by 9 inches. 8 pages. Bulletin No. 60 C. Hammer drills and stone-dressing tools for quarries and cutting-sheds. Illustrated, 6 by 9 inches. 16 pages. Bulletin No. 60 F. Hammer drills for construction, quarrying, and mining work. Illustrated, 6 by 9 inches. 12 pages.

EDITORIAL.

INNOKO produced $300,000 in 1909, according to estimates of the Geological Survey. The Innoko and Kuskokwim placer districts were visited last season by Mr. A. G. Maddren and a report on them has just been published. Incidental information about the Haiditarod region is also given that will be of especial value to prospectors going into this part of Alaska next summer.

FIRE has not yet made its annual visit to the Geological Survey at Washington and Congress has one more chance to protect public property by furnishing a fire-proof building. Last year a move in this direction was defeated by the unexplained opposition of Mr. J. R. Mann. This year not even an estimate seems to have been submitted. Possibly the officers of the Survey are discouraged at repeated failure, but the importance of safeguarding the Survey records would seem to warrant an attempt at least to get the matter before Congress.

AMALGAM thieves were cleverly trapped at Goldfield this week, and among those arrested was the town constable, who also happens to be a candidate for sheriff and prominent in labor union affairs. That is bad but no worse than the case of a banker lending money to an assayer on stolen ore. The combination, however, of thievery, politics, and labor union leadership, has been all too common in the West, and is the essential explanation of the low estimation in which the Western Federation of Miners is held by the public. We sincerely hope that progress is toward better things.

THAT Mexican banks are investing money in foreign countries indicates an accumulation of a surplus, and is a sign of prosperity, as pointed out by Mr. Enrique Creel, recently Mexican Ambassador to the United States, but it may also be taken as evidence of slackened industrial activity. That business should be aggressively active, however, is not necessary for the national welfare at all times, and we may accept Mr. Creel's interpretation of the action of the Banco Nacional, the Banco de Londres y Mexico, and the Banco Central in placing thirty million pesos abroad.

CASSANDRA was unpopular, and the prophet of evil will ever be unwelcome; hence prophetic utterances are conventionally optimistic. The silver miner was promised a higher price for his metal in 1909, and he actually realized the lowest average price on record. Messrs. Pixley & Abell in their annual silver letter, published elsewhere in this issue, find warrant for hopeful promises for 1910, despite

the fact that the demand for gold in the Orient is distinctly growing. The argument from the general revival of trade is a valid one, and, because world-wide, will probably operate, even if the trusts try to punish the Government and people by 'crashes', 'avalanches,' and other spectacular stock-gambling phenomena on Wall Street.

THE MIDWAY OILFIELD has recently been visited by a party of San Francisco capitalists that has returned enthusiastic. The gusher of the Kern Trading & Oil Company near Maricopa was inspected with especial interest. This has been producing about 3000 barrels of 20 degree oil per day since February 6. A short distance away the Ethel D. is flowing a steady stream. The Santa Fe, St. Lawrence, and other wells continue to yield heavily, and in many directions new work is under way. In 1909 this field produced a trifle less than 2,400,000 barrels, and additional deep sands were discovered.

A LITTLE GOLD is a dangerous thing. Out of it grow gilded dreams and disturbing visions of fairy castles. The feeble sprinkling of gold in the crystalline rocks of the Adirondack mountains in New York State has been the unfortunate cause of wasting many thousands of dollars that might have been better spent. For decades gold-mining has been attempted in the Adirondacks, and the faker with his wonderful 'new process' has flourished, largely at the expense of the merchants and petty capitalists of the Mohawk and Hudson valleys. Among these schemes the Sutphen process became distinguished as an artificial star of large magnitude. The rush of prospectors into the region in 1898, directly stimulated by the Klondike excitement, was so great that over 4000 claims were filed with the Secretary of State, and filings still continue in large numbers. Out of compassion for the senseless dissipation of good money in so fruitless a quest the State Geologist, Mr. John M. Clarke, has published a bulletin fully explaining the sources of this gold, and showing how thoroughly the region has been investigated, thus putting an end to further hopes of finding important deposits.

PRICES OF COPPER mining stocks have been much studied of late. In our Discussion department is presented this week an analysis of the value of five active stocks. These figures were prepared by one well qualified by experience and success to judge in such matters and are based on data emanating in the main from the companies concerned. As an expression of opinion it is worthy of careful consideration. The higher ruling prices for these stocks could only be based logically upon expectations of finding additional ore reserves or of higher prevailing prices for copper. The probability of reserves being increased both by direct exploration and by cheaper reduction rendering lower grades available may be granted, but as 'Investor' points out, the investment-life of the properties is already long, and there must be a limit beyond which the interest on the money spent in development, offsets the profit. It is impossible, as well as undesirable, to market all the ore at once, and in case of copper as of coal, iron, and steel, market conditions as well as costs of production enter into the problems of profit and loss. Higher prices for copper are expected by many, but prediction is always hazardous. Our own opinion is unfavorable to any immediate or considerable rise. It is doubtful whether these matters seriously enter into public estimation of copper stocks. It is believed that the stocks themselves will rise, and therefore people buy, with the result that stocks do rise. The problem is one in psychology rather than technology, and the astute leaders of Wall Street devote more attention to judging men than mines. Manipulation carries the leading stocks high and the others mount on the flood of public excitement. So long as this remains true, buying and selling of copper mining stocks will be a game rather than a business.

Corporation Tax Returns.

Corporations generally look forward with confidence to a decision by the Supreme Court of the United States holding the corporation tax law unconstitutional. Two test cases are now being tried, and if an attempt be made to collect such taxes before the question is settled, they should be paid, but under formal protest. It is the part of wisdom to comply with the law, partly because it is good citizenship so to do, and partly because it would leave a corporation in a less embarrassing position in case the statute were upheld. The attempt to raise money by a direct Federal tax, which after all is the cheapest kind of tax that a people can pay, is based upon the power conferred by the Constitution "to levy and collect taxes, duties, and excises." The authority of Congress is undoubted in this particular, limited by the requirements of apportionment according to population, of uniformity throughout the United States, and of avoiding what would be equivalent to duties imposed on articles the subject of inter-state commerce. If the law be held to violate the constitutional limitations, it would apparently be found vulnerable in regard to apportionment according to population. A layman's pronouncement upon this point is of no consequence; a lawyer's would be important in proportion to his gift of prophesy concerning the probabilities of the final twist which the Supreme Court may give to the Constitution. This is said in no spirit of disparagement; the Supreme Court is valuable because it is supreme, not because it is a fountain of infallible wisdom.

Leaving aside the speculative features of the matter, and conceding the practical wisdom of complying with the law, the miner confronts an interesting problem in making his statement to the revenue collector of his district. The law, of which copies may be obtained from the local revenue officers, requires such a statement to be submitted by March 1; it specifies the items, and the method of computing the net income. The tax is one per cent upon the net income in excess of $5000. The statement must be sworn to by the president, vice-president, or other principal officer, and its treasurer or assistant treasurer, and must set forth the total amount of paid-up capital stock of the corporation; its bonded or other indebtedness; gross income from all sources; all ordinary and necessary expenses; total losses and

amount written off for depreciation; amount of interest paid; amount of taxes paid; and net income, this being the remainder after deducting the out-go specified in the last four clauses. Once again the question of depreciation comes to the fore. It is warrantable to assume that any reasonable deduction, based upon customary experience, will be allowed as applying to deterioration of plant. This would vary from ten to twenty-five per cent, under ordinary circumstances. Depreciation, however, does not apply to orebodies; the tax is upon income, not upon assets. The law, however, affirms, "The deduction for depreciation should be the estimated amount of the loss accrued during the year to which the return relates, in the value of the property in respect of which such deduction is claimed that arises from exhaustion, wear and tear, or obsolescence out of the uses to which the property is put, and which loss has not been made good by payments for ordinary maintenance and repairs." This seems to apply to plant, or permanent equipment, needing renewal by reason of 'exhaustion'. There are those, on the other hand, who see in this language the opportunity to write off depreciation for exhaustion of ore reserves. A test case would be interesting, if the statute as a whole should receive the approval of the Supreme Court; meanwhile high legal opinion seems to lie against such a construction.

Reverberatory Smelting at Cananea.

Developments in the smelting of copper have proceeded at a rapid rate in the United States within the last fifteen years. Up to that time the tendency had been distinctly away from the use of reverberatory furnaces, and efforts were chiefly made toward the perfecting of blast-furnace smelting. Among these efforts the most notable were the attempts to dispense with fuel by the utilization of the heat-value of the sulphur in the charge, and the departure from the low blast-pressures of earlier days in order to increase the smelting capacity. Pyritic smelting in a form modified from that of its original advocates has become established as standard practice where conditions are suitable, but the need for rapid running aggravated the losses in flue-dust. Briquetting and sintering, though still attracting the attention of experimenters, and in some cases giving favorable results, have for the most part not proved capable of wide application. The improvement of the reverberatory has been in answer to the demand for economical treatment of flue-dust and calcined concentrate, which the blast-furnace cannot handle advantageously.

One of the most interesting contributions to recent reverberatory practice is found in a paper describing the operations at Cananea, Mexico, by Mr. L. D. Ricketts, originally published in the Bulletin of the Institution of Mining and Metallurgy. At Cananea, Mr. Ricketts has treated a difficult class of material, consisting of flue-dust and calcine in the proportion of approximately 2 to 1 at a cost of only $1.77 per ton of dry charge, using oil as fuel. This result has been rendered possible by the liberality of the Mexican Government in admitting fuel-oil free of duty. The furnace was constructed along the lines of the well known reverberatories in the smelter of the Anaconda Copper Company in Montana, with a hearth measuring 19 by 100 feet. The original design contemplated the use of coal, which was found unsatisfactory, mainly on account of the character of the fuel. The low-ash Gallup coal proved too light, while a coking coal from Dawson, New Mexico, left a bed of coke on the grate which burned too slowly. An attempt to employ pulverized coal proved uneconomical owing to difficulties in regulating the amount of air needed, while the ash filled the flues and rendered recovery of waste-heat from the furnace-gases impossible. Trouble was also experienced at times from the deposition of fine carbon in the form of soot upon the charge, constituting a non-conductor which seriously retarded the smelting. Fuel-oil, however, has yielded a solution of the difficulties previously experienced. Heat recovery is effected by the use of Stirling boilers of 300 horsepower each, two being regularly in service, and a third being held in reserve. The actual water evaporated per pound of oil burned in the reverberatory is 6.74 pounds, while the efficiency in a similar boiler fired direct with oil was 13.96 pounds of water for each pound of oil. Taking into account the temperature of the feed-water the relative efficiencies were 7.45 and 16.08 pounds of water respectively.

Taking the record month, it is seen that the charge contained on an average 7.13 per cent copper and 7.51 of sulphur, yielding a matte containing 40 per cent copper, with a recovery of 95.97 per cent. The slag carried only 0.41 per cent copper, a result which bespeaks excellent technical management. The composition of the slag shows silica up to 41.20 per cent, the iron (FeO) being 34.60, and the alumina 11, with 7.30 per cent of lime. In practice 8149 tons of charge were smelted with 7003 barrels of oil, of which only 3901 were chargeable to actual smelting. The remainder was represented by recovery in the form of steam. Mr. Ricketts points out that considerable advantage in the rate of smelting should be credited to the work of the McDougall roasting furnaces where the particles of concentrate are heated to incipient fusion, so that in addition to the oxidation of iron and sulphur a chemical union between the acid and base in the slag-making components takes place to such an extent as to materially facilitate the completion of the reactions on the hearth of the reverberatory. An interesting feature in the operation of the furnace at Cananea consists in the continuous fettling of the sides of the hearth by feeding dampened fine silicious ore through apertures along the walls. By this means the slag-line is protected, while from 10 to 15 tons of highly refractory material are daily smelted, at a great saving in cost and time, proportionately increasing the capacity of the furnace. The admirable work of Mr. Ricketts and his capable assistants will go far toward increasing the use of the reverberatory where the quantity of flue-dust and fine ore is sufficient to warrant such an installation. It is not surprising that some metallurgists are asking why it might not be better, where friable copper ore is to be smelted, to crush all to a suitable size and treat it exclusively in the reverberatory.

BY THE WAY.

That the value of money in commodities has varied greatly from time to time is well known. We are indebted to Mr. Stuart Croasdale for the following interesting discussion of the subject by Dr. Joseph Priestly, published in 1788. The original spelling and phraseology is carefully retained.

The Greek coins underwent very little change compared with that of the Roman money, or of the money of modern European states, and therefore is less worthy of our notice. All the allowance we are to make for the changes of value in the *Drachma* (a coin equal to the Roman *Denarius*, and worth about eightpence of our present money) and to which the changes of value in the rest of their money corresponded is, that from Solon to the time of Alexander we must reckon sixty-seven grains for the weight of it, from thence to the subjection of Greece by the Romans sixty-five, and under the Romans sixty-two and a half, a change which is very inconsiderable. The constant and stated rate of the value of gold to silver among the Jews, Greeks, and Romans, in the whole period of ancient times, was ten to one, with very little variation, and the rate of silver to Cyprian brass one hundred to one; and the general supposition is, that there was one fiftieth part of alloy in the gold coins of the ancients. At present gold is to silver as about fifteen to one, and silver to copper as seventy-three to one. The *As*, from being a pound weight avoirdupois, fell to two ounces in the first Punic war, in the second Punic war to one ounce, and presently after it was fixed by the Papyrian law to half an ounce. These alterations were occasioned by the necessities of the commonwealth; but as Arbuthnot observes, the plenty of gold and silver would have done the same thing, and have brought down such an enormous brass coin; or rather silver coins of an equal value, and less weight would have been introduced. It may easily be imagined how scarce silver was at Rome when, in all the early times of the Roman history, eight hundred and forty pounds of brass were equivalent to one of silver. Some say the proportion between these two metals before the first Punic war was nine hundred and sixty to one. The different proportion which has just now observed to have taken place in Greece, during the same period, shows how little communication there was between Greece and Rome in those times. Indeed the commonwealth gradually reduced this proportion, probably in consequence of a freer intercourse with other nations, which would necessarily be attended with the introduction of silver where it was so scarce. The adulteration of the Roman coin in some periods of their history exceeds anything we read of with respect to other countries. The money of Caracalla had more than one half alloy, that of Alexander Severus two thirds, and under Gallienus it was nothing more than gilt copper.

Corn was commonly reckoned in Greece at a drachma the medimnus; which, reduced to our computation, is four shillings and six-pence per quarter. In Demosthenes' time it was much higher; being five drachmas the medimnus, which is about one pound two shillings and seven-pence per quarter. In times of plenty in Greece the price of a sheep was eightpence, of a hog two shillings, an ox three pounds three shillings; and a soldier served for a drachma a day, which was about eight-pence. Upon the whole, we may perhaps allow that the proportion of money to commodities in the most flourishing time of Greece, or the time in which the classical historians wrote, was about one third less than it is at present with us; which was about the same that it was in Europe before the discovery of America. As the common people of Rome lived very much upon bread corn, the price of that article will be a better guide to us than any other single circumstance in judging of the proportion between money and the necessaries of life among them. The ancient price of corn in Rome, and to which it was reduced at the burning of Rome by Nero, was three nummi the modius, that is three-pence three-farthings the peck. According to Pliny, the coarsest bread was made from corn worth forty ases, equal to two shillings and six-pence three-farthings a peck; of wheaten bread forty eight ases, equal to three shillings and three farthings; and the finest of all eighty ases, or five shillings and one-penny farthing; so that about the time of Pliny, corn was considerably dearer in Rome than it is commonly at London. The article which stands next to bread corn among the necessaries of life is cloathing. Common wearing cloaths, made of wool, such as were always worn at Rome, we should not think very dear. For Cato the elder never wore a suit worth above one hundred drachmas, equal to three pounds four shillings and seven-pence; and we must consider that the Roman cloaths were not made close, but large, and loose, and therefore would last longer than our close garments. This article is likewise to be understood of plain undyed cloth, which was white; for the expence of dying, particularly purple, which the Romans and the ancients in general, most of all affected, was prodigious. Pelagium, one species of that dye, was worth fifty nummi, equal to eight shillings and eleven-pence, per pound. The buccinum, another species of it, was double that value: the violet purple was three pounds ten shillings and eleven-pence per pound, and the Tyrian double dye could scarcely be bought for thirty-five pounds nine shilling and one-penny farthing per pound. There must also have been a great difference in the fineness of their wool, and consequently in the price of it. For a Roman pound of Padua wool, the finest of all (though indeed when it was rather dear) sold for one hundred nummi, at which rate the English pound troy comes to seventeen shillings and eight-pence three farthings.

From the prices of all these articles taken together, we should conclude that the proportion which money bore to commodities in the most flourishing times of the commonwealth, and under the first emperors, was rather higher than it bears at the present with us. But this could only be the case at Rome, and in the neighborhood of it. All the necessaries of life were considerably cheaper in Greece. Polybius, who lived in the time of the third Punic war, says that provisions were so cheap in Italy in his time, that, in some places, the stated club in the inns was a semis a head, which is but a little more than a farthing.

Compressing Air by Water.

Written for the Mining and Scientific Press
By George C. McFarlane.

In some of our mining districts the mountain streams furnish abundant water-power during most of the year, and in many cases the streams can be flumed and piped to a compressor site contiguous to the mining operations. In such cases a standard air-compressor driven by a belt or rope drive from an impulse or turbine wheel furnishes a cheap and satisfactory supply of air for the machines and sometimes for the hoist and pump. While these furnish a satisfactory source of air-power for stable and proved mining properties, their installation is hardly justified in opening prospects and in work of like character which is not certain to extend over a long period of time. There are hundreds of streams in the West that would furnish ideal cheap power, but it happens that few of the larger producing mines are located contiguous to any of them. There are many promising prospects so situated, many of which would doubtless be developed if a small water-compressing plant could be cheaply and easily installed. Not only mine work but heavy rock and tunnel work on railroads in the West could be facilitated in many cases by using hydraulic air-compressors. I know of one instance in Colorado where a series of railroad tunnels was driven by steam-power, coal being hauled 30 miles up into the mountains to fire the compressor boilers, while a foaming mountain torrent that would have furnished hundreds of horse-power ran neglected in the canyon a stone's throw away.

A system of direct air-compression that has elicited a good deal of favorable comment from mining men is the Taylor system adapted to the development of falls and rapids of moderate height. I should say that this system would have a small field of usefulness in the Western country. While it is efficient and requires a minimum of attention in operation the great cost of installation, except in the largest units, would preclude its general use. The most recent installation is a 5000-hp. plant now about completed at the ragged chutes of the Montreal river nine miles south of Cobalt, Ontario. Work has been in progress on this installation for three years and for the past year a force of 200 or 300 men has been employed. The Montreal river has here, in about a 1000 ft., a drop of 28. The power people built a concrete jetty into the middle of the river and to protect the opposite bank from cutting, built a concrete wall in a trench a few feet back, and parallel with the bank. During the high water this summer the river current, thrown sideways by the jetty, gouged into the opposite bank as far as the concrete wall and partly undermined it, which illustrates one way of how not to attempt to raise the level of a swift river.

Just below the jetty, at the head of the rapids, are the two shafts, steel-lined, 16 ft. in diameter, and 360 deep. A 20 by 26-ft. tunnel 1000 ft. long connects these shafts with the uprise shaft at the foot of the rapids. The air is compressed to 140 lb. pressure and is conducted to Cobalt by a 20-in. pipe. The pipe was made in 40-ft. lengths with welded flanges, and sliding expansion joints set in concrete piers every half mile. Aside from the transmission pipe-lines, I would estimate the cost of the plant at the chutes as not far from $1,000,000. This makes the cost per horse-power for installation about $200, which does not compare favorably with the cost of an ordinary air-plant. I know of two small plants that were installed for less than $90 per horse-power, including flume and pipe-line, as well as wheel and compressor.

A Montreal power company, that is developing the falls of the Matabitehuan river 22 miles southeast of Cobalt, has a scheme which ought to furnish air as cheap at least as the hydraulic air company. With a 2000-ft. line of 5-ft. steel pipe, and a small dam, 300 ft. of head is secured for the turbines giving 12,000 hp., this is converted into electricity at 40,000 volts. It is intended to transmit to substations at Cobalt and use part of the current to drive four-stage air-compressors, selling the air to the mines.

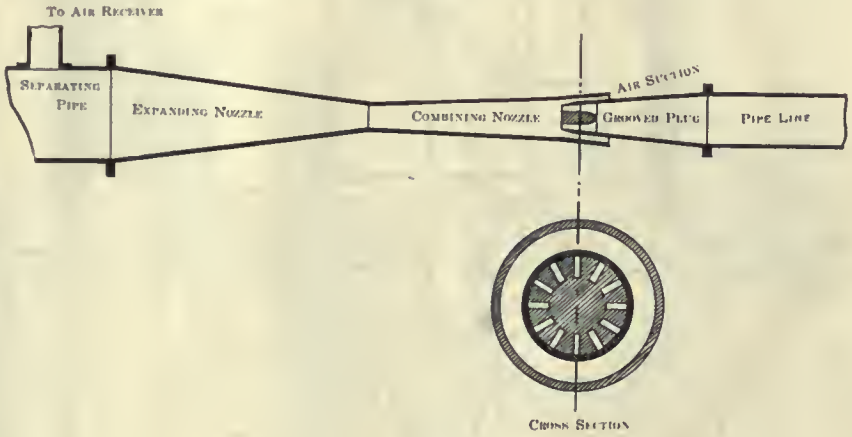

Fig. 1.

For mines or prospects that are close to high-line ditches or swift streams where a fall of several hundred feet can be secured with a mile or two of ditch and flume, the following simple contrivance can be used for direct air-compression. As shown in Fig. 1, a short nozzle is bolted to the pipe-line; this nozzle is plugged with a grooved cast block so as to divide the jet into ten or twelve streams as shown in the cross-section. These streams are directed into a throat pipe similar in shape to the casing of the Venturi meter. Air is sucked in and commingles with the water in the long gently tapering combining nozzle and passing the throat the stream expands into a length or two of large pipe where the air bubbles separate and pass into the nozzle pipe of the air-receiver. Only a portion of the energy of the water can be used in this way. For example, if the pipe-head were 400 ft. and the air pressure used 80 lb., 200 ft. of the head would be expended in compressing the air. After being freed from the entrained air, the water would be under a pressure of 80 lb.; equivalent to nearly 200-ft. head. This could

be used to run a water-wheel or allowed to run to waste. In the latter case the system would be wasteful, but in many cases a cheap, easily installed, plant is preferable to a more expensive one of high theoretical efficiency. To get good results it is important that the lines of nozzle and throat conform closely to those shown in the sketch, the combining nozzle, being in length about thirty times the diameter of the small jets. This is long enough to thoroughly mix the air and water. These multi-jets exert a strong suction; 20-lb. pressure will pull a 20-

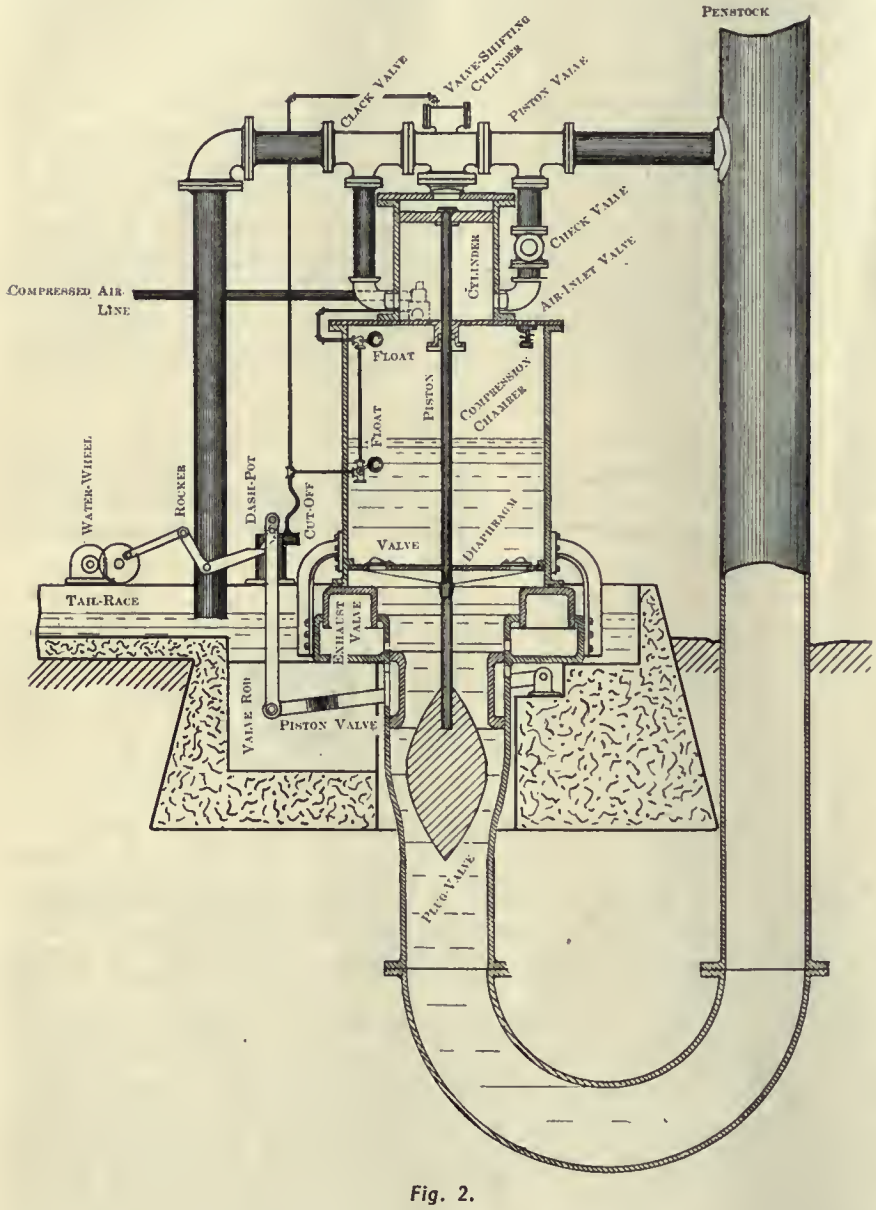

Fig. 2.

in. vacuum. If the pressure head of the water is 400 ft. and the air pressure 80 lb., 1 ft. of water will compress 1.5 ft. of free air, and the ratio between the area of the issuing jets and the area of the throat should be 1 to 2.1. This scheme may be used to good advantage around placers in case it is desirable to use a couple of small drills for block holding the big boulders. If there is a good pipe-head, an inch and a quarter bleeder turned into a small jet-compressor would furnish ample air.

In districts where only moderate heads of water are available, and no great expense can be incurred, I suggest a form of direct compressor similar to that shown in Fig. 2, which is practically a highly developed hydraulic ram. To understand the application of the ram or water hammer prineiple to air-compression, we will suppose a 40-ft. head of water has been flumed to the compressor site and conveyed from the pressure box to the compression chamber by 200 ft. of 2-ft. steel pipe laid on a fairly uniform gradient. We will also assume that the compression chamber holds 60 cu. ft. of free air. The first stage will be to turn the water pressure on the air-chamber, which will fill a little over half full and compress the air to 17.5 lb. Now to compress this air to 80 lb. and force it out of the chamber into the air-receiver will require the expenditure of 285,000 foot-pounds of energy. Our 200-ft. column of water in the pipe weighs 39,000 lb. If this column of water were allowed to fall freely (by suddenly opening the full cross-section of the lower end of the pipe) for a vertical distance of 7.2 ft., or 36 ft. on the slope of the pipe, it would, neglecting pipe friction, acquire a velocity of 21.9 ft., and a kinetic energy of 285,000 foot-pounds. If this were suddenly deflected into the compression chamber it would just have energy enough to ram the air to 80 lb. and drive it out of the chamber at that pressure. It is evident that the lower 36 ft. of water would have gone to waste without accomplishing any work. This means a loss of 18%. The friction would take another 10%, and if we assume fibre stresses of 10,000 lb. per inch in the metal of the pipe-line at 80 lb., the volumetric expansion of pipe-line and chamber under the ramming stress would amount to ¼ cu. ft.; occasioning a further loss of 1%. This leaves the net theoretical efficiency about 70%. From the above it is apparent that the longer the ramming stroke the greater the loss both from waste water and pipe friction. If, however, the air be rammed in the chamber in three or four stages, the theoretical loss would be reduced from 30 to less than 10 per cent.

To accomplish this latter is the idea of the design shown. The penstock pipe curves upward and delivers the water to the compression chamber through an enlarged orifice, the throat of which is opened and closed by a plug controlled by a hydraulic cylinder over the chamber. The pulsations in the pipe-line are caused by a large annular exhaust valve the full size of the chamber. The exhaust valve rests in an annular casing surrounding the inflow and is opened and closed by a piston valve actuated as shown by a small water-motor. For the case cited above, the piston valve would pulsate about fifty beats per minute and four pulsations would fill the chamber. To prevent the water kicking back out of the com-

pression chamber during the overflow cycle, a diaphragm with down closing wing-valves hangs on a shoulder of the piston rod.

The operation of the compressor is as follows: The small water motor pulsates the piston valve at any desired rate, the rocker-arm raising it and the dash-pot snapping it back. When water is turned in the main pipe line, it rushes into the lower port of the hydraulic cylinder, which raises the plug and diaphragm. The water now makes three pulsations, the third bringing the water surface in the chamber to the upper float, opening the auxiliary air line. Depending on the height of the water surface, the opening of the small port of the float valve is much or little. In the former case the piston valve gets a quick cut-off and the final pulsation is short. If the pulsations were not sub-divided into stages and the last one approximately regulated to the work it has to accomplish, the unbalanced water hammer would severely strain the machine. Coincident with the last pulsation the auxiliary air line also shifts the top valves, reversing the hydraulic cylinder, lowering plug and diaphragm, and at the same time the exhaust valve opens wide, permitting the water in the chamber quickly to escape. The receding water level throws the lower float and releases the air from the auxiliary line, throwing the upper cylinder valves and starting a new cycle. A check in the right hand cylinder feed-pipe holds the piston and diaphragm in position during the pulsations of the compression cycle. The compressor is shown on a concrete foundation. A light foundation will answer the purpose equally well. It is only necessary to pack the piston of the hydraulic cylinder and use a wood or leather bearing-ring for the diaphragm. The exhaust and piston valve only need to be machined to a reasonably close fit in their casing. The leakage through them, compared to the large volume handled, would be unimportant and any scheme of packing rings would impede their free action and increase the expense and difficulty of construction.

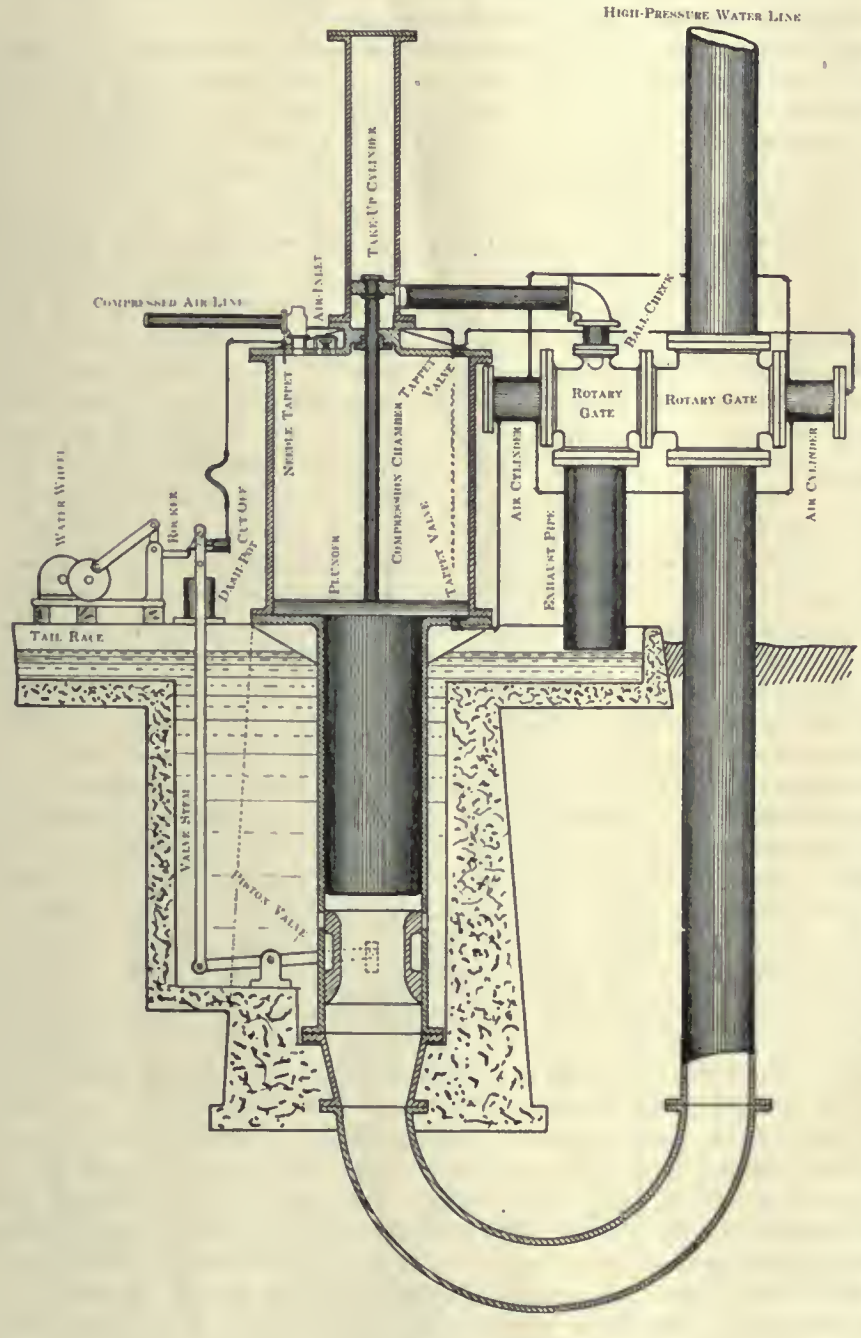

Fig. 3.

For utilizing high heads of water a direct-acting compressor similar to the one shown in Fig. 3, may be employed. This involves practically the same principles as the preceding one. As a pressure of 500 or 600 ft. of water would be too much to turn against the air, a hydraulic plunger is direct-connected to a piston of an air chamber of considerably larger diameter. Assuming the head of water at 300 ft. and the plunger 18 in., and the air piston 36 in. diam., if the water were admitted slowly to the plunger, 33 lb. of air at $^{7}/_{10}$ stroke would balance the water pressure. If the full pipe head were thrown on suddenly, the unbalanced pressure of the air in the first stages would allow the column of water in the pipe to acquire velocity head, which would carry the air pressure up to 70 lb. at $^{4}/_{5}$ stroke, allowing a good margin for friction and other losses. In the design shown, the last $^{1}/_{5}$ of the stroke of the air piston would be completed by three or four quick pulsations of overflow and water hammer. The arrangement is such that two rotary gate-valves, opened and closed by air pressure, alternately admit and release the pressure on the plunger. When the pressure is turned on, the plunger is shoved upward over three-quarters stroke, the water meanwhile flowing in the take-up cylinder. The air pressure gained is held by the ball check-valve in the take-up cylinder feed-pipe. At this juncture the air pressure is sufficient to crowd out the valve-stem dog and en-

gage the rocker-arm oscillated by the water motor, tripping the lower piston valve overflow, and causing three or four pulsations of water-hammer to completely expell the air into the air-line and receiver. At the end of the stroke the piston trips the tappet in the auxiliary air-line, causing the main valve to close. The exhaust then opens. As the exhaust gate opens, it unseats the ball valve in the cylinder feed-pipe, allowing the plunger to sink and the displaced water siphons into the tail race. The length of the last pulsation at the end of the compressing stroke is modified by the space to be traversed by the piston. If only a short distance, the needle tappet is raised higher, and a quick cut off given to the piston valve. The pistons in the air chamber and take-up cylinder would need to have metal packing rings, as they must be tight. The plunger would only need to be a machined fit as the leakage would spray the sides of the compression chamber and keep it reasonably cool. This latter design of machine would not furnish as good air as the preceding designs, because the air chamber would have to be lubricated and the air, not being in direct contact with the water, would be more or less heated and saturated with oil.

SAN MAURICIO MINES.

One of the most important undertakings in Philippine quartz mining has just reached the stage of assured success, according to *The Far Eastern Review*. This is the operation of the San Mauricio mine at Mambulao in the Province of Ambos Camarines on the Pacific coast of the Island of Luzon. Here there is a fine deep-water harbor in which large vessels can anchor within a quarter of a mile of the shore. The mine shaft is two-thirds of a mile from tide-water. The properties have an area of about 270 acres.

A 20-stamp mill from the Traylor Manufacturing Co. is practically completed and will be running in the early part of the coming year. It is the largest crushing plant in the Philippine Islands. The method of handling the ore and of extraction is described as follows: The ore is broken down into chutes, run into cars, and trammed to the shaft, which is equipped with a 65-hp. hoist of the Lidgerwood type. It is then hoisted to the surface and trammed to the grizzly and crusher floor of the mill building, the fine going through the grizzly and the oversize to the crusher to be reduced to 1½ in. From this point all the ore is handled by gravity. After leaving the crusher it enters the bin, which has a capacity of 150 tons. From the bin it is introduced to automatic feeders from which it goes to the stamps, of which there are four batteries of five each with a weight of 1050 lb. per stamp. It is there crushed so that it will pass through a 30-mesh screen. A certain amount of gold is amalgamated inside of the batteries. The rest of the free gold is caught on the plates. The pulp from the plates is run into launders which carry it to a classifier, where the pulp is separated into three different sizes and distributed from there by launders to the six Traylor concentrating tables on the first concentrating floor. The middling from these six tables is conducted to the lower concentrating floor on which there are two tables to be re-concentrated. The sand or tailing is then run to a dump and stacked for future disposal. The average value of the ore as reported upon by five engineers, H. W. L. Way, Carnegie Williams, E. Voigt, Charles Schneider, and Washington V. Vanderlip, is 1 oz. 16 gr. per ton. The cost of handling this ore, that is, mining, milling, concentrating, shipping of concentrate, smelting charges, and development work on the mine, should not be over $5 per ton of ore handled. It is expected that the mill will crush about 80 tons per day. The plant includes a well equipped assay office.

The San Mauricio mine is controlled by the Philippine Exploration Co., incorporated in the United States in 1908. Its head office is at 97 Water street, New York, with a branch office at 32 Plaza Moraga, Manila. The officers of the company are: F. H. Henry, president; James Cochran, vice-president; Vivian L. Outerbridge, secretary-treasurer; A. Heise, general manager. The other directors are Howard Gilbert and Halsey R. Carpenter. With the San Mauricio off its hands the Exploration company is starting in to develop two other properties in the same district, one of which is placer and the other quartz. One of these is the Batobalani dredging group. This property comprises 760 acres, and is situated on the Malaguit river in the well known Paracale mining district. It is about eight miles distant from the San Mauricio mine. The lower end of the group is just at the head of tide-water at a distance of about six miles from the sea. Materials for the building of dredges can easily be lightered or floated to this point. From 260 boring tests made on this ground the average per cubic yard of the dredgeable area is given as 24c. U. S. currency. The tests were made with a hand-boring machine, and it is the consensus of opinion of most mining men that this apparatus will not save more than two-thirds of the gold in the sample, which means that it would be safe to figure upward of 30c. per cubic yard. The before mentioned tests show the overburden to be handled to range from 2 to 7 ft. and the gravel or wash from 13 to 21 ft. This fixes the maximum depth of the dredgeable ground at 28 ft. and the minimum depth at 15, which are ideal conditions for dredging. To date, the entire area has not been proved, but tests are being pushed as fast as possible and a dredge will be ordered in the near future. The Exploration company has bonded this property for 18 months. The Robinson group is a tract of about 850 acres of mineral-bearing ground which forms an ell around the San Mauricio group, virtually making both properties one. There have been numerous shafts sunk and adits driven by native miners in the past on the Robinson group. The property is now being surveyed and active development will start on the same at the beginning of the coming year. The Exploration company has a three-year working bond on this group, guaranteeing to spend a fixed sum monthly, and at the end of the lease to install such machinery as the development work at that time justifies. While the property is as yet only a prospect, the surface indications are considered to justify the expenditure of considerable time and money.

Hanover Iron-Ore Deposits.

By Sidney Paige.

*The Hanover district is in Grant county, New Mexico, 12 miles N.70°E. from Silver City and two miles northwest of Santa Rita. It may be reached from Deming, New Mexico, by the Atchison, Topeka & Santa Fe railway. The area is just within the borders of the mountainous district lying between Gila river on the north, the desert on the south, and Mimbres river on the east. The general elevation of the district is about 6500 ft., with peaks rising 800 to 2500 ft. higher. As a geologic unit the district may be described as a narrow basin occupying the upper valley of Hanover creek, the iron ores being arranged more or less regularly around the edges of an intrusive mass of quartz-diorite-porphyry. (See Fig. 1.) The basin is, roughly, 2½ miles long in a north-south direction and averages three-fourths of a mile in width. On its west side the ores occupy the summits of the ridges; on the east side they are formed along the slopes of a higher ridge. Hanover creek occupies a central position, flowing southward and exposing frequently in its valley the intrusive rock mass. This intrusive is a quartzose-diorite-porphyry, and its contact effects have been marked. There is evidence that metamorphism has been selective, the more calcareous sediments suffering the most. Evidence of fracturing as an explanation of intense metasomatism is lacking. Volume changes, if they have taken place, are not observable. In those beds which were less susceptible to pneumatolytic changes the alteration has been more in the nature of a re-crystallization, with possible siliceous additions. It would seem reasonable to suppose that the purer limestones, as carbon dioxide was driven out, were invaded by magmatic solutions of high temperature, and that any tendency toward shrinkage was overcome by further accessions from the magma. In other words, those elements native to the intruded rock which were of a proper nature to form contact minerals (such as lime and silica) combined with materials from the magma, the whole forming a solution from which the present minerals originated.

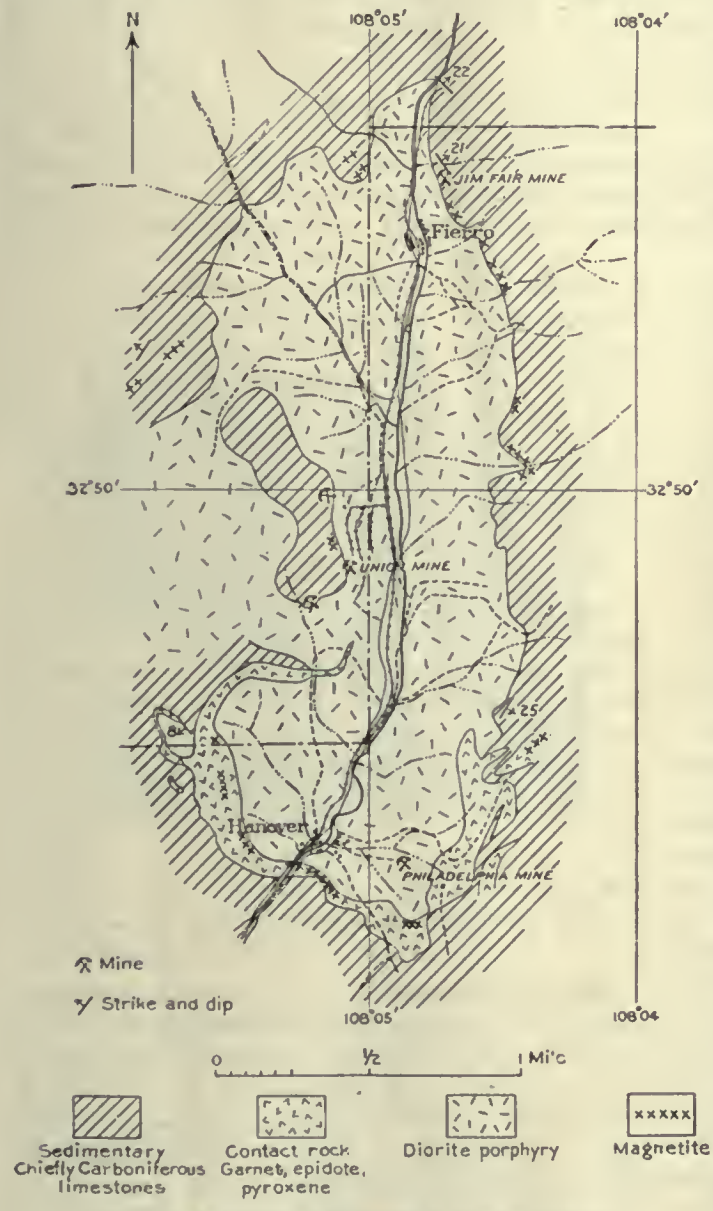

Fig. 1. Map Showing Relations of Hanover District.

The iron ores have been worked since 1899. In 1904 work was suspended because of labor difficulties, but since that time has proceeded nearly continuously. The principal mines are the Union and Jim Fair. They are leased by the Colorado Fuel & Iron Co., and all the ore is shipped to Pueblo, Colorado. The map (Fig. 1) shows clearly that the ores are arranged about the periphery of an intrusive stock, at or near its contact with sedimentary beds. With the exception of two localities, one in the northwestern part of the area, and the other in the northeastern part (not shown), where the ore deposit is believed to occupy former limestone beds between more siliceous layers, the orebodies are immediately next to the contact. They are, in the main, irregular lenticular masses of magnetite, in one place partly hematite. Where exposed at the northern and southern pits of the Union mine they are decidedly long as compared with their width and depth. At the Jim Fair mine a shorter comparatively thicker lense is exposed. All three bodies pinch out in length, and in the northern pit of the Union mine ore has failed in depth. Besides these large bodies numerous outcrops may be observed, indicating the same mode of occurrence; that is, lentils of varying width and thickness, swelling and pinching in horizontal extension, and, it may be safely presumed, presenting similar though uncertain irregularities in depth. A second class of ore, which for convenience may be termed 'soft ore', likewise occurs along the contact. It is characterized by the disseminated nature of the magnetite, which exists as finely and coarsely crystalline material with a considerable admixture of limestone, and depends for its commercial value on local concentration, whereas the value of the hard ores depends more directly on the size of deposits and their freedom from impurities. Of the

*Abstract from 'Contributions to Economic Geology' 1908, U. S. Geol. Surv., Bull. 380.

hard ores three bodies have been worked on a large scale, the two pits of the Union mine and the Jim Fair mine; in the soft ores the principal work has been done immediately south of the southern Union pit, though soft ore, whose commercial value remains to be proved, occurs along the eastern border.

The principal ore of the region is magnetite, though at the Jim Fair mine considerable hematite has been extracted. Varying amounts of chalcopyrite and zinc blende are associated with the iron ore, but figures are not at hand to express their relation, which is variable. Limestone and contact rock form the most abundant gangue material. In the hard ores the magnetite is generally massive and granular, but the magnetite of the soft ores presents in many places a fine development of crystal form, usually the rhombic dodecahedron.

Some 4000 tons of iron ore which were shipped to the Colorado Fuel & Iron Co. at Pueblo, Colorado, showed the following composition, being the average of 80 carloads:

	Per cent.
Iron peroxide	76.00
Iron protoxide	12.85
Phosphoric acid	0.041
Titanic acid	Nil.
Manganese oxide	0.95
Alumina	0.73
Lime	0.58
Sulphur	0.02
Combined water	2.32
Copper	0.085
Iron	63.20
Phosphorus	0.018
Silica	4.32
Manganese	0.60

But a word is necessary regarding the origin of the ores. Primarily they must be considered as part of the effects of the quartz-diorite-porphyry intrusion. C. K. Leith and E. C. Harder* have shown that in some localities contact metamorphism without much doubt precedes the deposition of magnetite, and that the latter is distinctly an 'after effect'. The form of the orebodies is suggestive. Most of them are irregular lenses occurring at or near the contact. Joseph Barrell and others have shown the possibility of shrinkage in sedimentary strata due to metamorphism. Leith and Harder, to cite a concrete example, estimate that a horizontal radial shortening of 200 to 500 ft., depending on the depth of the laccolith, was possible as a result of cooling in the Iron Mountain mass. This mass is of the same order of magnetite as the one involved at Hanover. It might be argued, therefore, that lenses, large and small, represent the filling of such shrinkage spaces, and that therefore the magnetite is distinctly an 'after effect'.

Certain other relations of the ore may be significant. For example, where metamorphism is not especially pronounced in the limestones—that is, where zones of garnet, epidote, and pyroxene are lacking—soft ores have formed; in other words, ores which because of their disseminated character and perfect crystallization suggest an emanation of highly heated solutions of volatile magnetite, precipitated by reduced pressure and temperature. On the other hand, where contact rock occurs these soft ores are lacking. The first inference might be that they were unable to form in such places because of the compact nature of the walls, and the second, that they were, therefore, later than the metamorphism. Though magnetite filling undoubted fissures in either limestone or porphyry was nowhere noted, at certain localities the magnetite occurs as lenses surrounded entirely by contact rock.

Leaving open, then, for further study the consideration of the precise time relation of the magnetite to the contact metamorphism, the following condition may be tentatively supposed to have existed. On coming to place, the heated magma, by solutions probably above the critical temperature of water, impregnated certain strata of the surrounding rocks. Adjustments, due to cooling of the porphyry, to possible volume changes in the intruded sediments, and to gravity, served to make of the contact zone a favorable locus of superheated gases. Magnetite, a mineral which several investigators have shown might be precipitated from iron silicates by reactions with lime, collected, replacing limestone, filling openings that may have gradually grown, and replacing in part the porphyry mass. The concentration might also be conceived to have been influenced by those laws which regulate the selective growth of mineral masses where abundant material is supplied.

With the exception of ore extracted recently from the southern part of the Union mine by underground methods, the ore has been mined by open-cut. The Union mine is situated on a steep hillside and the Jim Fair is sufficiently elevated to permit hauling by gravity. Tunnels in the Union mine and an open-cut in the Jim Fair, driven through the contact wall, serve as a roadway for the ore, and trams convey the product to bunkers at the railroad. Mexican labor is used almost exclusively. According to 'Mineral Resources', the district yielded 1,010,779 tons of ore in the years 1901 to 1907, inclusive.

*Iron ores of the Iron Springs district, southern Utah. Bull. U. S. Geol. Surv. 338, 1908, pp. 25-27.

Mercury minerals that are of unusual interest to students of mineralogy or crystallography occur in the Terlingua, Texas, field. A recent bulletin of the United States Geological Survey (405), by W. F. Hillebrand and W. T. Schaller, discusses in detail five of these minerals, kleinite, montroydite, terlinguaite, eglestonite, and calomel. Of these the first four were but recently discovered, and the chemical character of kleinite is still somewhat uncertain, though it is known to be a mercury-ammonium compound, the first such compound recognized in nature. Terlinguaite and eglestonite are oxychlorides of mercury; montroydite is mercuric oxide; calomel is the long familiar chloride of mercury.

None of these minerals is important as an ore of mercury, the metal being obtained chiefly from cinnabar, but also in the native state. The present report must be regarded simply as a contribution to scientific knowledge, by means of which the physical and chemical properties and the crystallographic character of the minerals, so far as determined, are definitely and permanently recorded.

Recent Milling Practice.

Written for the MINING AND SCIENTIFIC PRESS
By A. E. DRUCKER.

For more than a year past I have been visiting a few of the principal gold mining districts of the world for the purpose of making a detailed study of milling and cyaniding methods. A short description of some of the more important changes in these various places visited is here given. A more detailed account of the methods at Unsan, Benguet, Kolar, Waihi, Rand, and Kalgoorlie will be given in a series of articles to appear in *The Mining Magazine* and the MINING AND SCIENTIFIC PRESS within the near future.

Unsan, Korea.—The Oriental Consolidated Mining Co. possesses the most important gold quartz mines in eastern Asia. While other Korean mining properties are now recognized as possessing dividend-paying resources, the Oriental Consolidated mines have heretofore been the only ones operated continuously

An Old Korean Stamp-Mill.

on an extensive scale by modern methods in the Empire. It is safe to say that this company is the only one operating in Korea at the present time at a profit. Its mines are producing at present about $125,000 in bullion per month, and has produced to date over $12,000,000, of which about 40% has been paid in dividends. The success of the Oriental Consolidated Mining Co. has been largely due to the good management of K. F. Meserve, who has been its leader from the beginning. The company has a total of 230 stamps in five different plants, crushing about 30,000 tons of low-grade gold ore per month. It is quite base, containing from 5 to 6% of gold-bearing sulphides, with very little silver. Considering the methods of milling and cyaniding in the past, remarkably good extractions have been obtained. The present treatment consists in stamping, plate amalgamation, concentration on Frue or Union vanners, and cyanide treatment of the concentrate, after mixing with coarse sand, by the 18-day percolation method. This cyanide treatment gives an actual extraction of 84% of the gold. The above method, on a $5 to $6 ore, according to the 1909 annual report, gave an actual gold extraction of a little over 82%. Of this the recovery by plate amalgamation was 46%, by cyaniding the concentrate 36, and 6% was in the cyanide residue dumps, leaving only 12% actual loss.

During 1910 the O. C. M. Co. has decided to make extensive changes at its reduction plants. I shall shortly re-design and carry out these changes for the company, the intention being to bring the concentration plants up to a more efficient point by installing classifiers and grading into three products. Wilfley tables will be used for coarse sand, Frue vanners with corrugated belts for the fine sand and slime, and cement slime-tables to further treat the residue from the slime vanners. The final residue from the concentration plants is to flow to waste, being too low in grade for further profitable cyanide treatment.

The concentrate (200-mesh) is to be all-slimed in tube-mills in cyanide solution. The resulting slime, together with the slime sulphide collected from the vanners and cement-tables are to flow in cyanide solution direct to my patent air-agitation and continuous leaching vat. Upon completing the extraction here, the sulphide slime residue is to pass to my patent tangential vacuum filter (a continuous slime-filter), where the remaining dissolved metal is to be removed. An actual gold extraction of 90% is expected from this slime sulphide by the above treatment. Other important additions to be made by the company are plants for treating old cyanide residue dumps. There are three of these having a total value in gold of about $900,000. The material assays between $4 and $8 per ton. After completing a series of experiments on a practical scale, extending over a period of some four months, I came to the conclusion that the following method would be the most profitable for such a material: (1) Re-concentration on Wilfley tables, giving two products, namely, coarse sand residue, assaying $1.25, and sulphide, assaying $12 per ton. The product fed to the concentrators assays $4 to $5 per ton in gold. (2) All-sliming of the sulphide in tube-mills with water, so that all will pass a 200-mesh screen. (3) Dewatering the sulphide slime before cyanide treatment. (4) Cyanide treatment in tall vats designed to give an air-agitation and continuous leaching at the same time. (5) Filter-pressing or vacuum-filtering of the residue from the agitation vats to completely remove the dissolved gold.

The serious troubles in the direct all-sliming treatment are the presence of large amounts of ferrous sulphate from the oxidation of marcasite and arsenopyrite, and also the fine charcoal scattered through the dumps. A re-concentration on Wilfleys at once rids the sulphides of the fine charcoal and washes out the ferrous salts and other harmful cyanicides with the sand residue. The further grinding in tube-mills gives the sulphide a final wash and prepares it for successful cyanide treatment.

Benguet, Philippines.—The only two gold mines of importance here are situated in the Benguet district, and are controlled by the Benguet Consolidated and the Bua Mining companies, of which the former is now on a dividend-paying basis. At the time of my visit the Bua mine had a 30-ton plant, consisting

of two 3-stamp Hendy mills, and a cyanide plant. The treatment was simple plate-amalgamation, followed by a leaching of the sand by cyanide. The slime assayed from $1 to $1.50 per ton, and was allowed to run to waste. The ore milled averaged from $8 to $10 per ton, and was easy to treat, containing much calcite, some quartz, and a little sulphide. It has an alkaline reaction and consequently requires no lime previous to cyaniding. This company claims an 80 to 85% actual extraction of the gold in the ore.

The Benguet Consolidated is an up-to-date progressive concern, a great deal of credit being due C. M. Eye, the superintendent, for making the work a success. Formerly the reduction plant consisted of two 3-stamp Hendy batteries, amalgamating plates, spitzkasten, sand cyanide leaching vats, and mechanical slime agitators. The slime was treated by the decantation process with poor results. The ore consists of a large amount of quartz, some calcite, and from 2 to 3% of sulphide. It assays about $10 per ton in gold. The actual extraction was only about 65%. At the time of my visit numerous alterations in the plant were under way, including the addition of new sand-leaching vats, Wilfley tables, tube-mill, Ridgway slime-filter, and a special treatment plant for the concentrate. I understand that most of these improvements have now been made, and much better results are being obtained. The ore treatment is as follows: (1) Crushing in water with stamps. (2) Outside plate-amalgamation. (3) Separation of sand from slime by spitzkasten. (4) Cyanide percolation of sand after a previous concentration on Wilfleys. (5) Cyanide agitation of slime after dewatering. (6) Vacuum-filtering of slime. (7) Concentrate from the sand to be all-slimed in a tube-mill and given a special cyanide treatment. (8) Precipitation of gold from cyanide solutions by means of zinc shaving.

Kolar, India.—The most important gold quartz mines in this part of the world are situated at Kolar, in the State of Mysore, which are under the management of John Taylor & Sons. There are between 600 and 700 stamps in the district distributed among six different plants. The ore at Kolar is extremely simple to treat, and yields over 90% actual extraction by simple plate-amalgamation, followed by cyanidation of the sand in vats. There is only a fraction of 1% of sulphide in this hard quartz ore. It assays on an average about $16 to $17 per ton in gold. The extraction by amalgamation is between 70 and 80%, while that on the sand by cyanide leaching varies between 60 and 75%. For years the slime from the stamp-mills was stacked for future cyanide treatment. During the past year or so it has been the practice to mix as much of this slime as possible with the sand, and yet get satisfactory leaching in the vats, so as to prevent, as far as possible, the accumulation of further untreated slime. This is ancient practice, however, and besides I cannot see the economy in stacking slime for several months and allowing it to dry and cake before receiving a cyanide treatment with the sand. Would not the direct treatment of the slime alone yield a greater net profit? Evidently the Kolar people are beginning to think that it will, and have been doing their utmost to solve this problem. For more than a year past H. W. Leslie, consulting metallurgist to the Kolar group, has been experimenting on a commercial scale with the large untreated slime-dumps, trying to find the most profitable method. At the time of my visit to Kolar one Ridgway slime-filter and two tall Brown agitators were being experimented with, and as far as I could learn good extractions had been obtained. The Brown vats were quite satisfactory. The Ridgway was the first continuous vacuum-filter put to commercial use in dealing with large tonnages of gold-bearing slime. Mr. Ridgway deserves credit for his ingenious invention. What is wanted at the present time in a continuous vacuum-filter is a machine that is not only able to treat large tonnages of slime successfully, but also one that is simple in construction. No continuous filter has yet come to the front to take the place of the Moore or Butters type. Sooner or later some form of continuous filter will take the lead, for this method of slime-treatment is still in its infancy.

The Mysore, Champion Reef, and Ooregum mines, possess some well constructed stamp-mills built almost entirely of stone and steel. There are concrete mortar blocks and wooden battery frames at the Mysore. Stamps are being used at Kolar that weigh from 1100 to 1300 pounds. At the Mysore a new rock-breaker house has been constructed apart from the mill. Crushing is done in stages in large Blake crushers, and then in small Gates breakers, the whole arrangement being up-to-date. Although the Kolar district has been backward in its cyanide treatment during the past, I must say that I picked up many good points as regards mill construction, the arrangement of rock-breaker plants, melting and refining (furnace arrangement), and zinc extractor-house work. The zinc extractor-houses and the arrangement of furnaces, where crude-oil burners are in use, compares well with the best I have seen in other countries. The permanent manner in which the Kolar people construct their plants is most creditable. I have found, as in Kolar, that gold mining districts like the Waihi, Kalgoorlie, Unsan, and the Rand, have their own special strong and weak points in regard to ore treatment. If one wishes to study the best practice in stamp and tube-milling, go to the Rand; if it be slime-treatment (vacuum-filters and Brown agitators), go to Waihi; and for dry crushing, roasting, and pan grinding, see Kalgoorlie. I may sum up the chief gold producing districts, as regards efficiency in treatment, not taking into consideration Mexico and the United States, as follows: Rand leads in stamp and tube-milling; Kalgoorlie leads in dry crushing, roasting, and pan-grinding; Waihi leads in slime treatment, agitation, and vacuum-filters: Unsan leads in concentration and cyanidation of concentrate; Kolar compares well in mill construction, bullion melting, and refining equipment. It is doubtful whether tube-mills would pay to install for grinding the coarsest of the sands with the present milling methods, where 30 to 35-mesh battery screens are being used. However, if it were a case of getting through more ore with the present size plants, then instead of adding stamps, better install tube-mills and put on 10 or 15-mesh screens.

Montgomery-Shoshone Mine.

Written for the MINING AND SCIENTIFIC PRESS
By A. H. MARTIN.

The mines and mill of the Montgomery-Shoshone Consolidated Mines Co. are located in the Bullfrog district, Nevada, a short distance from the town of Rhyolite, the main commercial point of the district. The company owns a large tract of mineralized land comprising the original properties of the Montgomery-Shoshone, Shoshone Polaris, and Crystal Bullfrog companies. In addition the company also owns two mill-sites embracing 10 acres, water-rights with a flow of 500,000 gal. per day, and 500 acres of fertile farm land in Oasis valley. The mill, water-rights, and pipe-line are controlled by the Bullfrog Reduction & Power Co., a subsidiary corporation. The capitalization is for 500,000 shares of a par value of $5 each.

The most prominent and extensively developed mine of the company is the original Montgomery-Shoshone. This property was located in 1904 by E. A. Montgomery, and the property was opened by driving a cross-cut tunnel. The original discovery of ore was made by A. James, who received $10,000 as a reward from Montgomery. The cross-cut opened an immense body of talcose ore early in 1905. In 1906 the consolidation of this mine with the Shoshone Polaris and the Crystal Bullfrog was effected by Charles M. Schwab, the New York steel king. The deep development of the mine and the erection of the reduction works commenced almost immediately. As the company's treasury did not contain sufficient funds, sufficient capital for the construction of the mill was advanced by Mr. Schwab, the amount being about $300,000. This debt has been largely paid off and the company is rapidly approaching the period when dividends should be declared.

Montgomery-Shoshone Mine and Mill.

The formation is rhyolitic, with a huge fault-dike of basalt cutting into the rhyolite and breaking the formation badly. The ore occurs principally in the talcose formation lying south of the basalt fault. Cutting across the property is a high zone of crushed ore irregularly traversed by seams of quartz and ore-laden talc. The ore-zone has been opened in the centre of the glory hole for a width of 250 ft., but its length remains undetermined. In the glory hole the ore is quarried and shipped direct to the mill. Development and breaking costs are kept low, while the ore will average about $8 per ton. The glory hole is the principal source of production at the present time, with systematic development constantly augmenting the extent of the wonderful deposit.

The Montgomery-Shoshone shaft is north of the glory hole and has been sunk to a depth of 700 ft. It is triple-compartment, and has opened excellent bodies of rich talcose ore at several levels. At the 600-ft. point a heavy flow of water was encountered, while the talc shows a large percentage of sulphides. Levels have been run from several points and extensive orebodies intersected. The shaft is equipped with a Hendrie & Bolthoff double-drum geared hoisting engine with 12-in. cylinders and 16-in. stroke. A speed of 600 ft. per minute is generated, and with single cages 300 tons of ore are handled every 16 hours. A Chicago Pneumatic Co. compressor operates ten 3-in. drills. Two 100-hp. Heine water-tube boilers, using oil for fuel, furnish the steam for the compressor. The mill is operated throughout by electricity taken from the wires of the Nevada-California Power Co., the company contracting to furnish 300 hp. per day for a period of five years.

South of the glory hole the formation is less irregular, and a series of promising parallel southerly veins has been demonstrated to a considerable extent. These have been cut at varying depths, and are among the richest yet opened by the company. Farther west the Polaris fissure-vein has been demonstrated to a limited extent by a shaft. Considerable ore of fair grade is exposed. It is conservatively estimated that ore to the value of $1,000,000 is blocked in the various workings of the Montgomery-Shoshone mine proper, while systematic developments are adding to the estimated reserve. It is estimated that the developed ore will average $10 to $11 per ton. The company is directing particular attention to the development of the orebodies opened in the shaft, and to the enlargement of the glory hole, where the ore is exceptionally good. Later on the deposits of the Crystal Bullfrog and Polaris claims will be given more attention. About 100 men are employed.

The ore is received from the mine by two 13 by 24-in. Blake jaw crushers and reduced to a maximum size of 1½ in. It is then elevated to a storage bin commanding a set of 14 by 42 Traylor rolls, crushing through a ½-in. punched steel screen. The undersize passes to a second row of rolls of the same size and type, and the oversize is returned to the first battery for re-grinding. From the second rolls the reject returns to the first line for further reduction, while the undersize, reduced to 6-mesh, passes to the fine-grinding department. This consists of a battery

of fine-grinding Traylor rolls and two Chilean mills. About 75 tons of material are handled every 24 hours, all the ore having to pass a 40-mesh Tyler double-crimped screen. Crushing is performed in cyanide solution and has proved quite satisfactory. From the re-grinding department the pulp passes to two Dorr classifiers dividing the product into concentrate, sand, and slime. The concentrate is delivered to a 4 by 9-ft. Allis-Chalmers tube-mill and treated for 24 hr. It is then discharged into five 12 by 16-ft. cone-tanks and kept in constant agitation by compressed air fed through an ordinary ½-in. pipe. This method has proved particularly effective. The extraction ranges from 97 to 99.57%. After passing from the two Dorr classifiers, the sand is received by seven Wilfley tables and delivered to a series of sand-collecting tanks. From these it is elevated to the strong-solution tanks by a Blaisdell excavator, Robins belt-conveyor, and Blaisdell distributor. The sand is kept in action four days, sufficient cyanide being added to the solution to make it sufficiently strong. The pulp next passes to the weak-solution tanks, where it remains six days.

The slime from the Dorr classifiers is received by 10 Frue vanners. From these the pulp passes to the collecting tanks. A Trent agitator next receives the pulp and keeps it in constant agitation for 8 hr. It is then transferred to the settling tanks and the solution decanted. It is now delivered to the filtering department. This contains two presses of 50 Butters leaves each, and one press of 40 Blaisdell leaves. The final solution is delivered to 10 zinc precipitating boxes, constructed of iron. The usual zinc precipitating process is used. The extraction runs from 89 to 90%. Milling costs are about $2.25 per ton, and efforts are being made to reduce this. The water is received through a 14-in. pipe-line from Goss Spring, which furnishes a constant supply throughout the year. The ore assays about 1 oz. gold to 12 silver, while the capacity of the mill is about 200 tons per day. The total costs of mining, developing, and milling are kept down to about $5 per ton, and late reports of the management indicate that the company is earning profits at the rate of $226,000 per year.

The mill was designed and installed by the Traylor Engineering Co. The gold-silver bullion is shipped by express from Rhyolite. A spur of the Las Vegas & Tonopah railroad connects the mine with Rhyolite, the line going direct to the ore-bins and mill warehouses. Supplies are accordingly handled at low cost. Timber is somewhat scarce, but the excellent transportation facilities enable this and other supplies to be brought in at comparatively low rates. John G. Kirchen is general manager of the property and E. M. Kirchen superintendent of the mill.

Rapid advancement of the large gas-engine was made possible by improvements in the production of cheap gas directly from fuel by means of the gas producer. A few scattered producer-gas plants were installed for power production in the United States before 1900, but the application of engines of this type to the production of power in any general sense has been developed since that date.

Stacker for Hydraulicking.

Written for the MINING AND SCIENTIFIC PRESS
By SUMNER S. SMITH.

In hydraulic mining one of the largest problems is the disposal of the tailing. In many situations there is not sufficient room to handle it by gravity, and some form of stacker must be introduced. Hydraulicking, where at all available, is such a cheap and successful method of work that stackers capable of handling the coarse material at low cost are much to be desired. W. R. Heslewood, of the Big Creek and Chanchula Placer Mining companies, operating in Hayfork valley, Trinity county, California, has devised one which is admirably suited to a number of such situations. While the general principle of the machine is old, credit for the device as a whole should be given to him. The form of stacker shown in Fig. 1 was designed to handle gravel from creek-bed where there was a heavy seepage and no other way to dispose of the tailing. The companies named owned an ample supply of water, which is essential to the working of the machine. Besides the ordinary hydraulic equipment, enough ⅛ or $^3/_{16}$-in. sheet iron for an elevator, ⅜-in. sheet iron for liners, and ⅜ by 2½-in. strap-iron for riffles is necessary.

To install the apparatus a site near the centre of one end of the channel is selected and a space of 30 ft. across washed clear to bedrock by one of the giants, an auxiliary lift keeping the pit free from any excess of water. A 3-ft. sump is dug in the bedrock to accommodate a hydraulic elevator. This is fitted with a ball joint to prevent the constant jarring and settling, throwing it out of line, Fig. 2. The bell of the elevator is 30 in. diam., tapering to a 12-in. throat, which in turn is connected to a 15-in. pipe with a reverse taper. The nozzle is of the ordinary 5-in. giant type. Working with a 90-ft. head the machine elevated the seepage, fine, and the water from two field giants 16 ft. vertically. The bell of the elevator is constructed of the ordinary hydraulic-pipe iron with ¼-in. liners riveted in position. These last for a season's run and occasion little trouble. The elevator thus constructed is so light that four men can carry it.

To stack the tailing a chute was built at right angles to the line of the elevator and sloping upward at an angle of 30°. It is 4 ft. wide, 24 ft. long, and constructed of 1¼-in. plank on a frame of 4 by 4-in. pieces which rest on 6 by 6-in. sills. The lower portion of the sides is lined with 1¼-in. plank spiked in position. In each corner and in the centre is a 2 by 4-in. stringer on edge, Fig. 2, on which the riffles rest. These are also made of 2 by 4-in. pieces spaced 2 in. apart and beveled off so as to give a drop of 2½ in. between. They are covered with ⅜-in. strap-iron 2½ in. wide. The grizzly, Fig. 3, and side-boards or wings, not shown, were then built over the elevator, and a 3-in. drive giant set up 20 ft. in front of the chute. Just back of the nozzle at a convenient point a gate-valve was placed that connected with an auxiliary lift that kept the pit free from water when the elevator stopped. Two 4-in.

field giants wash the gravel to the chute and the drive giant forces it up stack, the fine material falling through the grizzly or riffles to be raised to the sluice-boxes by the elevator. These are of the ordinary type, but the small amount of material handled permits a short length and nice adjustment.

The field giants handled 600 cu. yd. per 24 hours and the drive giant could have taken care of a third in addition, as it was idle a large part of the time.

Fig. 1. General View.

Fig. 2. Stacker Showing Riffles.

When the tailing stack reached the top of the chute a couple of heavy plank were spiked to the frame and the gravel easily driven to a vertical height of 25 ft. The cost of handling the material exclusive of equipment was less than 5c. per cubic yard, but with the introduction of a large elevator with a 6-in. nozzle and an extra field giant Mr. Heslewood expected to reduce this to 3 or 4c. per cubic yard.

The advantages of this method are: (1) It can be used in many places where the ordinary form of hydraulic mining is restricted on account of the tailing. (2) It easily disposes of a large amount of seepage and separates and stacks the tailing in one operation. Its advantage is that it is only applicable where a large supply of water can be obtained.

Radium in Australia.

Written for the Mining and Scientific Press
By John Plummer.

At a recent meeting of the Royal Society of New South Wales, T. H. Laby read a paper on Australian minerals containing radium. In the course of his paper, Mr. Laby stated that late in 1904 he received from an Australian mineralogist a specimen to test for radio-activity, and it was found to be so strongly radio-active as to indicate the presence of radium. Some uncertainty exists respecting the place from whence the mineral was obtained, it having been found among a quantity of silver ore shipped to Germany. A fairly large percentage of pitch-blende had been obtained in the ore. It is now believed to have come from the northern districts of New South Wales. The chemical and physical characteristics of the mineral experimented upon showed that it differed in certain particulars from those of the well known German pitch-blende, containing more water and being more dense, and being evidently a secondary pitch-blende. Its radio-activity was marked, the mineral being 1% more active than the German variety, and there could be no question of the presence of helium. Since it had the composition of a secondary pitch-blende, it was to be expected that helium might occur in such quantities as to make its recovery payable. Moreover, the mineral contained only such elements as were readily separated from one another by the methods used to obtain uranium and radium from German pitch-blende. The attention of prospectors in the Australian silver-bearing districts is now becoming directed to the possibility of tracing the lost mineral. Mr. Laby also mentioned a specimen of monazite from Pilbarra, Western Australia, which gave off radium emanation when heated.

A couple of prospectors from Radium Hill, in Central Australia, about 300 miles from Broken Hill, visited Sydney this winter with mineral specimens from a radio-active orebody examined some time ago by D. Rawson, mineralogist to the Shackleton Antarctic Expedition. Mr. Rawson gave the locality its name and found the orebody to be from 3 to 5 ft. thick. The deposit was discovered in 1906 by a prospector, and subsequently ascertained to be carnotite of the best quality. The importance and value of the discovery were unreservedly recognized, but, for some reason or other, the mine, on which a shaft had been sunk 50 ft., was abandoned by its lessee, who subsequently proceeded to Western Australia. Some few months ago the claim was re-located by a couple of prospectors in search of pitch-blende. Descending the shaft they found the deposit as the original discoverer had left it. The mineral was extremely hard, but they managed to break off a hundred pounds, portions being sent to several schools of mines, Melbourne and Sydney Universities, and various scientific men. The discovery is regarded as one of the most important of its kind yet made in the Commonwealth, and further development will be watched with interest. The discoverers have decided to extend their shaft down to the sulphide zone beneath the water-level, above which minerals invariably become oxidized, the deposits lower being expected to prove extremely rich. Bulk samples are to be forwarded to America or Europe for treatment, and should the results prove favorable, steps will be taken to place the radium-extracting industry on a business footing.

Vanadium, another radio-active mineral, is believed to have been discovered in the Antarctic by the Shackleton Expedition. At present there is only one specimen in Australia, which is in the possession of T. W. E. David, who accompanied the explorers as mineralogist. It was discovered on a large moraine on the coast of Victoria Land, where it occurred as a thin film on joint faces of igneous rock. The films, although numerous, were thin as note paper, but their color readily caught the eye with their bright green tint. Mr. David explained that although vanadium is most valuable in itself and has hitherto been obtained for industrial purposes from Colorado and Peru, its chief interest consists in the fact that wherever it is found, radio-active substances, if not radium itself, are generally present. In color vanadium is an asparagus green until exposed to the air, when it becomes an orange yellow. In reference to the discovery of the mineral, and the possibility of finding others, Mr. David said: "The general geological structure of the immense coastal ranges of the Antarctic, and the character of the rocks of which they are composed, renders it probable that minerals of the rarer earths will be found there. Of course, vanadium is one of these minerals. But I would discourage any hopes at present of a commercial value attaching to the discovery. It is entirely premature for the belief that the mineral found necessarily belongs to any deposit of commercial value. The immense coastal range of Victoria Land rises almost sheer from the sea to a height of from 8000 to 12,000 ft., and is formed chiefly of granite and gneiss, together with slate, schist, and limestone. The steep slopes of this range are almost bare of snow and ice for several months in the year, and during a period of from three to four weeks, commencing a few days before Christmas, there is usually a thaw, the effect of which is to soften the sands and the gravels reposing on the sides of the ranges. Soon after the thaw sets in, torrents of water rush down the rocky gullies in the ranges, and thus it would be possible during these few weeks in the year to prospect the sands and gravels." The delay in connection with the return from the magnetic pole prevented Mr. David and his party from doing any prospecting, the sands and gravels having again become frozen and hard as a rock. Some promising quartz was, however, obtained.

Mining is declared to be a 'public utility' by the fundamental mining law of Mexico. This admits of protection of a superior order. Incidentally it greatly facilitates economical operation through the servitudes and easements which logically follow from this principle. It also precludes locking up mineral resources by the owners of land when discovery is made by others. In the United States it has not been made legally a public utility, though there are some court decisions looking that way.

Discussion.

Readers of the MINING AND SCIENTIFIC PRESS are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy. The Editor welcomes the expression of views contrary to his own, believing that careful criticism is more valuable than casual compliment. Insertion of any contribution is determined by its probable interest to the readers of this journal.

Copper Stocks and Their Value.

The Editor:

Sir—The copper industry is apparently in the throes of consolidation. It is obvious to an onlooker that the reason for this consolidation lies in three factors: (1) over production; (2) so-called porphyry coppers; (3) stock inflation and manipulation.

Before the advent of the porphyry coppers there had been a long period of comparative calm and peace in the copper industry. With the advent of the porphyries, however, and the contemporaneous panic of 1907, conditions changed. Because of the enormous tonnage and small copper content, it has been necessary to handle heretofore unheard of quantities of material to justify the investment in the porphyries. This condition has led to hysterical expansion beyond all sound reason. Figures have been made that show that the larger the tonnage produced, the greater the profit, based, of course, upon the fact that interest never sleeps. Carried to its absurdity, it might show that if the 80,000,000 tons of Utah ore were all extracted and worked in one year the profit would be enormous, and it is exactly this absurd proposition that is in a measure governing the price of porphyry copper stocks. Regardless of prosperity and copper consumption, a mad rush to extract the greatest tonnage in the least possible time has been entered upon. The result can only be a production of copper that cannot be easily assimilated. Of course, this is done with an eye single to the stock market. Anything to boost shares and create speculation is welcomed, regardless of the best interests of the property. The result of it all has been the necessity for something new in order to maintain prices. Therefore, it is now proposed to put all, not only the porphyries, but also the Cole-Ryan and Amalgamated properties, into one merger that we are told will also include the Cerro de Pasco and other properties outside of the United States. It is the intent to control the price of copper, possibly fixing it at 15 or 16c. per pound. This is so impossible that it is bound to end sooner or later in disaster, in which case the public will probably be holding the sack. The table herewith furnishes food for reflection. It is in a measure unfair to Nevada Consolidated and Utah Copper, because they are producing; Ray, Chino, and Miami are not and will not be for some time to come.

INVESTOR.

The Yaqui Country Revisited.

The Editor:

Sir—Writing three years ago I described the then existing situation in respect to the Yaqui 'uprising', comparing it with the uncertain mood of an individual who might be watching the antics of a dog which was growling and wagging its tail at the same time; it was difficult to know which end to believe. Referring to the same simile, I took occasion to warn my fellow men in mining that the tail of the Yaqui dog was wagging deceitfully. Subsequent events have proved that this was a right estimate of the situation. And what of it today? It is with the

Iron Cropping Near Rialto in the Yaqui Country.

idea of setting at rest some controversion on the subject that I am contributing these notes which deal with well attested facts. They have been collected in an extended visit to the Yaqui river.

The question of the real situation respecting the Yaqui's disposition toward the native of Mexico as well as toward the American visitor, still admits of a variety of opinion, emanating from people more or less informed upon the subject. Some of the latter are numbered among those who signed the 'round robin' which did such criminal injury in circulating false representations of security, a notion of security which was brutally contradicted by frequent depre-

dations and by the taking, from ambush and otherwise, of a great number of human lives, mostly native Mexicans. I repeat what I have indicated before, that when the United States Consulate of Hermosillo, Sonora, lent its aid and gave countenance to the petition then circulated for signatures, its agency put a blot upon the escutcheon which decorates the American Consulate; for in the act of signing there was withdrawn from the American citizen the protection and the rights which a consular agent is supposed to be and is paid to be safeguarding. This is unforgiveable.

By treaty-terms, under negotiations of about two years ago, the Yaqui Indian was to be restricted in his movements and not allowed to go north of Torres. His pay was fixed at a minimum of ₱1.25 per diem:

stream of truth is lost in the muddy waters of any journalism that trades on the sensational in the way that does the parent mind of 'Barbarous Mexico'.

Crime, injustice, and scandal are not confined to any one nation, and the ventilation of one evil and another in the flaring colors of yellow journalism does more harm than good; this for the reason of circulating false impressions and overdrawing the real conditions, until truth becomes distorted by the creations of an over-wrought brain. Apart from the question of the over-drawing of an unhappy subject, it is a question, of which I can call to mind at least one parallel in the old life insurance scandals, whether the exploiting of crime and things criminal accomplishes any real good unless it points to the cure or provides the means of remedy for the evil which it decries. In the case of the 'Barbarous Mexico' publications it certainly does not; instead, it has the effect of embarrassing many a countryman whose business and political ends are not served by such an attack upon Mexican institutions, its Government, and the rule of its penal settlements. De-

Route of the Yaquis.

portations of the Yaqui fighting man and his family have been made to Yucatan over a period of years. The small map shows the route from Yaqui territory to the penal settlement. Yucatan is 1000 miles south of New Orleans; it has an area of 80,000 sq. mi. The capitol city is Mérida, with a population of 60,000. The laborers on tobacco, sugar, and other plantations consist of native Mayas and some Chinese, besides Yaqui importations and exiles. The latter have been estimated to number from 6000 to 7000 out of a total of 100,000 men and women. Deportation has gone on apace to tobacco fields and to mines, to Yucatan, Campeche, Chiapas, and Tabasco, and the mortality has been shockingly high, but is it not always high in penal colonies? When were health resorts and penal colonies synonymous?

In the question of the righteousness of the Indian cause there is debatable ground for Mexican, American, and Englishman alike, for all have been confronted with a situation in which each has separately justified to himself his own particular method of extermination of a race which, numerically small, stood in the way of the annexation of its lands by a powerful aggressor and a traditional enemy. History repeats itself. In all these instances has there not inevitably and relentlessly resulted, first, the absorption, and then the virtual extermination, of the race which must give way to superior numbers, to overwhelming power, and to the crushing force of the invading party? In an article in *Harper's Monthly*, for January 1910, entitled 'The Vanishing People of the Land of Fire', by Charles Wellington Furlong, a closely similar case is mentioned. In the closing paragraphs he writes, "Who can blame the Onas for resisting being literally pushed off the edge of the world? Fewer and fewer smoke wreaths of their wigwams have sent their violet haze against the dark wet forests, and like the dying embers of their camp fires the last of the Onas are going out." The North American Indian, the Boer, and the Yaqui are fast losing their happy hunting grounds and the lands which gave them birth.

FORBES RICKARD.

Denver, January 31.

California Eight-Hour Law.

The Editor:

Sir—Both the opinion recently handed down by the State Supreme Court and the comment of the technical press upon the eight hour law, overlook the essential dissimilarity of the bases of the demands for the legislation applying to mines upon the one hand and 'reduction works' upon the other. Although in its ultimate sociological analysis the enactment of an eight-hour law applying to underground work in mines, is but a manifestation of the universal tendency toward a shorter working day, yet such legislation rests immediately upon the undeniably hazardous and unhealthful nature of the occupation. But it is not seriously urged that metallurgical works are inherently unhealthful; they are certainly no more so than industrial plants in general. Most of the labor is not ardous, and nowadays the noxious gases and injurious dust are pretty nearly eliminated. Even lead smelters have become nearly free from poisoning, and the stamp-mill man can but smile at the theoretical dust raised by the Supreme Court. The real demand and the real justification for limiting by law the hours of labor in mills, smelters, and reduction works, to eight, rest upon the persistence of that pernicious relic of the industrial dark ages, the twelve-hour shift, 7 days per week, 52 weeks and the odd day per year, and half of them night shifts.

The operation of smelting and roasting furnaces is obviously, of necessity, continuous; interruption of the operation of many other forms of reduction works is often inconvenient and expensive; yet when one beholds huge factories, costing millions of dollars and employing thousands of men, working but a single day shift of 8, 9, or 10 hours, closing on Sundays and the leading holidays, one wonders wherein lies the strenuous necessity compelling every little stamp-mill to run every possible one of the 525,000 and odd minutes per year. Yet so deeply rooted has the custom become that even to suggest that a mill might close on any day but the Fourth of July would be sacrilegious, and it would be deemed a sign of insanity even to think of closing on Sunday.

Assuming the necessity for uninterrupted operation, it surely is not a righteous and justifiable order of things to compel a man to devote half his life to

the actual performanee of his labor, yet the eight-hour day for mill and smelter work has nowhere in this country been voluntarily granted on a large scale. It has usually been obtained by the violent and costly method of strikes; only in a few cases by the peaceful means of legislation.

The mill and smelter man, eating his 6 o'cloek breakfast and his 8 o'cloek supper by January lamplight has a saying that the 12-hour shift permits a man only to work, eat, and sleep; in July, tossing about on his midday bed, beating the flies and cursing the heat between his fitful and futile attempts to obtain a transient forgetfulness of his 12, or 12½, or even 13-hour night-shift, he modifies his January axiom; he can only work and eat.

I said that the labor of reduction works, with its half-your-life working day was not inherently unhealthful or injurious, but who ever saw a fat millman?

Small Ore Shippers.

The Editor:

Sir—The accompanying letter from a small shipper is offered in the vernaeular beeause in its native dress it reveals the point of view of a supposedly injured person, and at the same time discloses an intellectual obstaele to explaining the situation so as to carry conviction of the smelter's honesty. The fact is that no smelter should aeeept a shipment which was not sampled in the presence of the shipper or his representative. If a lot of ore is too small for that purpose, it were better to leave it alone. In this ease the ore was reeeived at a sampling works, and with intent to favor a small shipper it was accepted without control sampling. The result follows in the words of the unfortunate prospector:

"Your letter of the 28 at hand and I note contents now all I ask of you is to send me the finals and a statement of it so I can send the statement to the party that I have leased the ground from so they can see that I am honest with them in regards to the royalty so you see I have bin keeping them posted what the ore assayed as I was taken it out. Certenly If I would have got fair treatment from you people my ore ought to have assayed $20 a ton or better. I would not have thought bad of your assay of the ore but I had it assayed right along as I was taking out and put nothing in the pile but what would pay me to shipp do you all think that if I new the ore would only go what it did that I would have shipped it no it would have stayed right here in a pile. Mr. Harris told me when he heard that I shipped the ore to you people the best thing I could to be thare and see you all sample it and he said if I did not my return would very small I told that I would trust to you people to give me fair treatment but I have found out to my sorrow the other day Mr. Harris asked how my returns turned out and I told him that you shot it to me in long jerks and then he told me some years ago he shipped some ore and he had trouble with you all. Certenly for me to come up to see you make another cut of the sample would only be wasting time and money and money is as scarce as hens teeth to me at present so please send me what you intend to send and I will call it enough certenly I am no hog I know when I have enough."

This tale of disappointed hopes carries its own moral, and shows how the ore-buyers come to suffer ill-repute.

Colorado.

Denver, January 14.

Mining and Metallurgical Society.

The Editor:

Sir—As a member of the Mining and Metallurgical Soeiety of America, I am in receipt of the index to the first 18 bulletins issued by that Society and covering the period from June 1908 to December 1909. On glancing at the reeords of this new organization I note that 'discussion by members' is indexed carefully, giving the names of each member participating in the debates on matters of professional interest. I note, however, that only the names of New York and Philadelphia members are given, and chiefly those resident on Manhattan island or its suburbs. There was a rumor that the Society had members elsewhere, as at San Francisco, and that its representatives in the City by the Golden Gate had occasionally foregathered in earnest conclave, but then, you know, rumors are so often wrong, are they not? Joking apart, the Society will suffer if—by its index or by other means—the idea goes forth that it is a New York affair and confined to a coterie of reformers dwelling among the sky-scrapers of Broadway. The records of the San Francisco seetion were printed in detail in the Mining and Scientific Press, where they were read by most of those likely to derive benefit from the discussion on professional ethics, instead of reaching merely the handful of earnest men constituting the present membership of the new society. Thus one of the functions of the Society was fulfilled, as it is not by the issuance of an index devoted almost entirely to the remarks printed in bulletins that are read by the 165 members. Reeently the discussions of the San Franciseo contingent have been represented by a couple of short paragraphs in the secretary's bulletin, and in those paragraphs only the bare skeleton of a lively debate is preserved, together with the hint that the members have taken suitable nourishment before venturing to contribute remarks apparently unworthy of being put into eold print. The new society is not flourishing, and it will not flourish until it is conducted on broader and more generous lines.

T. A. Rickard.

London, January 25.

The Boston Stock Exchange has admitted to its unlisted department 777,723 shares of the authorized capital stock of 1,000,000 shares of the Ray Consolidated Copper Co. The par value of the stock is $10, but recently 188,727 shares were subscribed for at $15 each, payable in three installments of $5 each, December 30, 1909, January 7 and March 7, 1910. The Exchange has also admitted to the unlisted department 80,000 shares of the 100,000 shares of the capital stock of the Indiana Mining Company.

Concentrates.

Most of these are in reply to questions received by mail. Our readers are invited to ask questions and give information dealing with the practice of mining, milling, and smelting.

Potash salts have not been discovered in Japan, and owing to the moist climate it is not expected that they will be found.

Foreign coins are made from time to time at the United States Mints by agreement and as a matter of courtesy. In 1909 the San Francisco Mint made 693,170 silver pesos for the Government of San Salvador.

Calumet & Hecla has paid $109,750,000 in dividends on an issued capital of $2,500,000, and in 1909 earned $37.26 per share on a copper production of 69,000,000 lb. From January 1, 1905, to January 1, 1910, the average annual dividend was $47.20 on shares having a par value of $25 each.

Goldfield Consolidated Mines Co. is capitalized for $50,000,000 in shares having a par value of $10 each. According to the report for the year ended October 31, 1909, 3,558,848 shares had been issued. The gross earnings for the last fiscal year were $6,598,870, with net profits amounting to $5,026,619. The stock was quoted February 11 at $7.60 per share.

Standardization continues. The Institution of Mining and Metallurgy (London) has decided that the word 'gallon', as used by its members, shall represent the imperial gallon measure of 10 lb. water; that temperatures be expressed in degrees Centigrade, and returns of gold and silver be expressed in terms of fine gold and silver, not as 'bullion'.

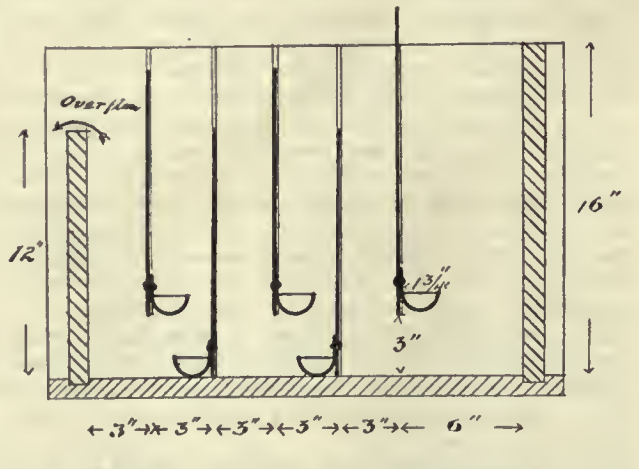
Original deposits of gold to the amount of $142,124,941 were made with the United States Mint and Assay Offices during the fiscal year ended June 30, 1909. In addition, under-current and mutilated United States gold coin containing 184,486 standard ounces was received for re-coinage, the coining value of which in new coin was $3,432,288. The difference between the face value of the old coins and the new coins made from them amounted to $26,049.

Federal laws providing for development of waterpowers on public lands have so far consisted merely of clauses or phrases in certain acts regarding rights of way. They provided for no regulation of waterpower except in the National Forests. The principal laws are, 26 Stat., 1095, and 'an Act relating to rights of way through certain park reservations and other public lands' (Stat. L., vol. 31, p. 790). There are also regulations issued by the General Land Office, approved June 6, 1908.

Grooves, channels, or other minor riffles on a concentrating table, such as a canvas-table, or buddle, usually prove of benefit only in so far as they compensate for inequalities in the density and volume of the pulp fed. Because of the great difficulty in regulating these in ordinary mill-practice they find a place in practical work. Shallow grooving in herring-bone pattern on a cement surface has recently been adopted by A. E. Drucker with advantage. The great success attained in slime concentration on Rittinger side-bump tables by Charles B. Parsons at Bonne Terre, Missouri, was due primarily to the close approximation to uniformity in the feed which he reached with his distributor. This was of the overflow type from a rising column, split at the overflow-lip into equal parts for the several tables.

Canvas-tables, so-called, depend for their efficiency largely upon proper friction of the surface. The firmness with which the heavy minerals are held varies greatly with different substances. Of all types of cloth-covering the best yet found are linoleums and rubber, either of which surpass common canvas. The ideal surface, however, is ground glass. The cost of this material, and the frequency of breakage prohibit its use. Cement is sometimes employed. Perfect homogenity is difficult to attain with ordinary portland cement. A better grain, more nearly approaching that of ground glass, together with uniform density, insuring more even wear, is obtained by using hard white plaster, such as is employed for the finish of interior walls in houses.

The amalgamation trap sketched below is a modified form of the well known 'Homestake' trap, used by H. S. Reed, Jr., who describes it as follows: "It consists of the regulation box made of 1-in. lumber, planed and well jointed to make water tight, with grooves in the sides for the baffles to slide in freely. The baffles are of ⅛-in. black iron, to which are riveted cups made from copper plate. The cups are made by bending the plate over a piece of 1½-in. shaft or 1¼-in. pipe, one side being as high as the centre of the circle, while the other side extends a couple of inches higher for riveting. The ends are closed by half circles of wood ½ in. thick and the cups may be used with or without mercury. The



first baffle is 15 in. high to prevent splashing and to give head to the pulp, the others all being 12 in. and interchangeable. No handles are provided, for I find that if the sand is packed around the cups sufficiently to require handles for removing, the cups would be pulled off or at least bent. The last two cups catch nothing and the greatest amount is found in the first. This trap, 22 in. long by 14 wide and 16 deep, will handle 50 tons of pulp per day, which should be delivered by a sluice the width of the trap instead of from a pipe."

Special Correspondence.

JOHANNESBURG, TRANSVAAL.

The New Year Opens. — East Rand Shaft Sinking. — Bore-Holes and Developmen'.—Base Metals.—Rand Dividends.

The opening of the new year finds things on the Rand in a state of quiet progress, unbroken by any startling events or revolutionary changes. One can only sympathize with the editor of the *South African Mining Journal* in his efforts to fill his pages with novel information or opinions, without falling back upon the stock padding of the 'beneficial influence of amalgamations', or the revival of platitudinous chairman's speeches. Even the Stope Drill Competition falls to provide grist to the journalistic mill.. It is true that occasionally some fragments of drilling statistics are published, but these are about as useful and interesting as the assay-values of single sections in development reported by some mining companies in evidence of their good fortune. At the same time, it cannot be said that work is slack upon the Rand. A year ago, when the stock market was brighter and funds readily available for new projects, much work was commenced, which is now steadily proceeding. The starting of vertical shafts is an item of imimportant news which is only followed by another announcement of extreme interest months or even years later, at the striking of the reef. In the Far East Rand today shaft sinking is proceeding upon two properties—the Springs Mines and the Grootvlei Proprietary—which is of the most vital concern to the whole industry, and yet, in its purely current aspect, is of small technical significance. Upon the results obtained in these shafts will largely depend the chances of an enormous area in the East Rand basin being rapidly exploited. Development indications will reflect upon an area, capable of supporting some twenty producing companies, of which at present our knowledge is meagre and only represented by notoriously untrustworthy bore-hole cores. This eastern region, to the south of the better known portion of the East Rand basin that includes the New Modderfontein, Kleinfontein, Van Ryn, Brakpan, and Geduld, constitutes the greatest speculative factor in calculating the Rand's probabilities of long life. Success or failure in the area between and south of Springs and Grootvlei will make a difference of twenty years at least in the estimate. At the meeting of the Lace Proprietary, J. Dale Lace (chairman) referred to the contradictory results of development and diamond-drilling in the East Rand. His own company has been signally unfortunate in its borehole assays, so that he has good occasion to express the hope that shafts, if sunk, would produce more encouraging results. It is certainly true that development results in the Brakpan, Modder B, and Van Ryn Deep have been far better than previous drilling led one to anticipate. Though the gold is patchily distributed, the law of averages should have put things straight, and one must still acknowledge the probability of large stretches of unpayable ground occurring in the Far East Rand basin. In the course of his speech Mr. Lace touched upon the labor shortage, and remarked "the labor will be found in an equitable, reasonable, honorable, honest, definite, and uniform native policy." Shareholders at least cannot complain that they do not get good value for their money in the matter of redundant verbiage.

The records of base-metal production in the Transvaal show a small but steady improvement. Results in the tin district of the Rooiberg have been disappointing in some cases, notably the Weynek, whose mill is shut down. The total yield of copper ore, tin ore, galena, lime, and other minerals has been as follows for the years ending June 30: 1906, £88,435; 1907, £147,875; 1908, £218,926; 1909, £321,734; half year ended December 1909, £235,000 (approximated).

F. W. Harbord, the well known steel expert, is now investigating and reporting upon the iron and steel manufacturing prospects of the Transvaal. His caution was indicated by the few remarks he made at a scientific meeting recently. It is recognized that his findings will be as conclusive as anyone's verdict could be in the light of present knowledge. The rumor current, to the effect that his report will be found unfavorable, is therefore most unwelcome.

Compilations of the aggregate Rand dividend distributions for the year show a result of £9,238,396, in respect of 56 companies. This total marks a satisfactory increase on previous returns, as indicated by the following summary.

Year.	Total dividends.
1901	£415,813
1902	2,148,715
1903	3,285,499
1904	3,937,624
1905	4,754,348
1906	5,565,969
1907	6,962,416
1908	8,569,916
1909	9,238,396

The 1909 declaration brings the Rand aggregate from 1887 to date up to £62,982,239. The new contributors are the Main Reef West (the Neumann mine, which has been developing an exceptionally high-grade zone of Main Reef Leader), the New Goch, the West Rand Consolidated (a newly equipped mine), and the Jupiter, which is the 4000-ft. deep property owning part of the famous Simmer Deep mill. After eleven years' absence, the Wolhuter returns to the dividend-paying list with a modest 5% declaration. This mine owes much of its present prosperity to good management, and to an improvement in the lower levels.

PHOENIX, ARIZONA.

Yuma County Mines.—Clara Con. — Bonanza & Golden Eagle.—Planet.—Mack's Ruby.

The mines in Yuma county are now especially active. The Clara Consolidated Gold & Copper Co. is operating at Swansea, 25 miles north from Bouse, the latter a station on the Wickenburg-Parker line of the Santa Fe. Swansea is four miles south of the Bill Williams, among a series of hills, low ranges and ravines drained by that stream. Eight miles farther north is the Planet mine, and still farther is the McCracken, the former principally copper and the latter mainly lead. The Clara Consolidated is one of the enterprises of George Mitchell and his associates, who within two years have developed their mining property, erected a smelting plant, and built a railroad from Bouse to Swansea. The railroad is nearly finished and will have train service inaugurated by March 1. The smelting plant probably will be ready to operate in April. The surface holdings of the company comprise 165 claims, the principal development being on a copper-bearing lode that strikes northeast between a gneiss foot-wall and a schist hanging wall. The lode has a width between walls of 90 to 180 ft., and a dip of 33° northwest. While all the vein filling is claimed to be mineralized, the richest ore occurs in lenses and shoots. It is stated, however, that the greater part of the body of ore will be hoisted and smelted. The composition of the ore, as given by the company's metallurgist, includes the following: iron, 36 to 40%; lime, 3 to 8; silica, 33 to 36; copper, 6 to 8; gold, $1 to $3 per ton. The oxidized and carbonate ores extend, generally, to a depth of 200 ft., and below this depth is a chalcopyrite in the main, though small lenses and streaks of cuprite and carbonate ore are found mixed with the sulphides. The cropping of the lode above described is traceable one mile on the company's ground. The mine openings consist of four shafts. No. 1 sinks vertically to a depth of 408 ft. Starting in the hanging wall, it strikes the vein at 65 ft., and the foot-wall at 310-ft. depth. No. 2 is a 45° incline that is down 285 ft. in the foot-wall. No. 3 is a prospecting shaft not in use. No. 4 is 600 ft. southwest from No. 1, and is to be sunk to 1000 ft. vertically and will become the principal working shaft. It is being sunk in the hanging wall, is now down about 125 ft., and it will strike the vein on its dip at 500 ft. below the surface. This shaft has three compartments, two 4½ by 5 ft. each for cages, and one 4 by 5 ft. for manway. Shafts No. 1, 2, and 4 are each equipped with a gasoline hoist, but No. 4 is to have a 125-hp. geared steam-hoist, which is on the ground ready to be installed. The present wood head-frame will be

replaced by a 90-ft. steel structure. It is stated that there are 1800 ft. of driving from the 200-ft. station, and 900 ft. of similar work from the 300-ft. station in shaft No. 1. This includes cross-cuts from wall to wall at a number of places. There is a 6-drill air-compressor at No. 1, though the gangue material is soft and does not require power drills to any great extent. The drifts are timbered with 8 by 8-in. tunnel sets, and the stope sets are of 10 by 10-in. timbers. The collars of the three working shafts are at the same level, the trackage from them extending to the storage bins at the smelter. Two Jeffrey electric locomotives will be used for hauling ore. At the smelting plant a 700-ton copper furnace, 44 by 280 in., is in position and ready for work. The furnace opens at the top into a Mitchell steel hood, 10 by 26 ft., to serve as a device for precipitating as much as possible of the flue-dust. This opens into a main flue, 8 ft. diam., leading into two balloon flues, each 5 by 7 ft. Following this is the brick and concrete dust-chamber, 20 ft. wide, 12 ft. high, and 90 ft. long, opening into the steel stack, which when finished will be 150 ft. high. The floor of the dust-chamber is of concrete, having hoppers for discharging the flue-dust into cars underneath. It is understood that a second furnace will be installed as soon as it can be shipped in over the railroad. Two blowers, to supply the blast for the furnaces, have been set in place, and a third has been shipped. The foundations are in for the steel converter building, which is to contain a 50-ton electric crane and two stands of copper converters. The blast for these will be supplied by a Nordberg low-pressure air-compressor. A Westinghouse steam-electric generator will serve to operate the electric crane and supply power for the trolley lines of ore and slag cars. The converters are to be manipulated by electric power instead of by hydraulic power. A crusher, set of rolls, and a mud-mill are being installed for preparing the silicious ore for converter lining. The charging cars to be used are to have automatic weighing attachments for weighing the ore and coke before they are dumped directly into the furnaces.

The water supply for smelter, mines, and domestic use is obtained in a well close to Bill Williams river, four miles away, a lift of 600 ft. being necessary. At present a gasoline pump is used to force the water through a 3-in. pipe-line into one wood and two iron tanks situated on a hill above the camp. A steam-pump of larger capacity is to be put in at another place on the river, and a 6-in. pipe-line laid, and much larger storage-tanks built.

The Clara and Mora groups, two miles east of Swansea, form a part of the main property. These are being developed and it is expected that they will supply a considerable tonnage of silicious ore for the smelter. Sampling the ore in 100-ton lots from this group is said to have shown that it carries 50% silica and satisfactory amounts of copper and gold. On the staff of the Clara Consolidated are H. L. Browne, general superintendent; Harry Mitchell, superintendent of smelting plant; and N. E. Siprell, mine superintendent.

John B. and Ancil Martin, of Phoenix, control the Bonanza and Golden Eagle M. Co., which owns the old Harqua Hala mines and mill, situated eight miles south of Salome. The property was a rich producer from 1888 to 1894. The two mines in the group, one mile apart, are connected by a tramway. The deepest workings are 400 ft., and on this level is a body of sulphide ore which is said to have assayed 4.8% copper, 1.22 oz. gold, and 5 oz. silver. The equipment includes a 40-stamp mill having amalgamation plates, but no concentrators. During the last three years the property was operated by lessees, but not successfully. It has reverted to the owners, who are developing.

The Planet mine, situated near the Bill Williams, and which is under bond to the Lewisohns, is being explored and developed, with Thomas Varden in charge. The equipment consists of a Rand air-compressor, two Sullivan drills, and two churn-drills for prospecting. A new working shaft is being sunk, and about 30 men are employed.

Near Vicksburg the Yuma Copper Co., owned by Michigan men, is developing some copper claims, and L. S. Judd, in charge of the La Belle M. Co.'s interests, is doing similar work, with a showing of copper and silver in a gangue of limestone and manganese. He has sunk a shaft to a depth of 300 ft. and will now install a gasoline hoist. Mack's Ruby mine, five miles east from Parker, is being explored and developed in the interest of Eastern parties who have it under bond. W. P. Blake, consulting engineer, states that the property has a contact vein, between limestone and schist, the ore consisting of quartz, carrying copper and gold.

MEXICO.

Dos Estrellas. — Guanajuato-Chapala Power Agreement. — Amparo.— Nueva Luz Shaft. — Railway Matter. — Oaxaca. — Hamilton-San Juan Litigation.

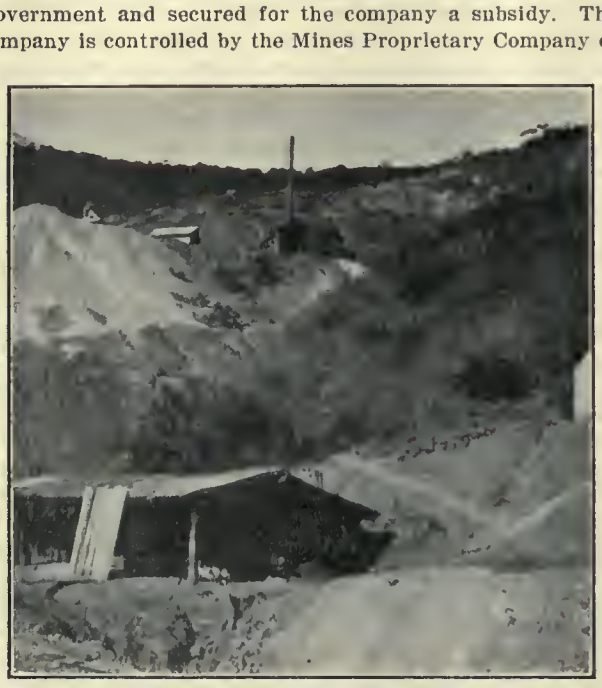
The great Dos Estrellas mine in the El Oro district yielded profits in 1909 of ₱4,226,635. Out of these net returns handsome dividends were paid. In December, which was one of the best months of the year, the ore handled in the two reduction plants amounted to 40,070 tons. The Dos Estrellas is a new mine, and its phenomenal success recalls the fact that in the early days of the Dos Estrellas company the stock, which had a par value of ₱100, and which later reached a value of ₱10,000, sold for a song. The property was located by Francisco J. Fournier, a French engineer, in 1900, and the company formed with a capital of ₱300,000, there being 3000 shares. Two adits were started, but it was not until three years later that these cut the veins, and in the meantime it was with difficulty that the enterprise was sustained. Three veins were developed, and one of these, La Veta Nueva, yields ore running as high as ₱20,000 per ton. This orebody is being held as reserve. When the Dos Estrellas shares reached a value of ₱10,000 each they were deemed unwieldy for trading purposes, and the company was reorganized with shares at a par value of ₱1 each. Fournier's dividends from Dos Estrellas stock, the bulk of which he holds, have made him a multi-millionaire.

An agreement for a division of territory has been entered into by the Guanajuato Power & Electric Co., of Guanajuato, and the Chapala Hydro-Electric & Irrigation Co., of Guadalajara, and as a result the Chapala company will not undertake to transmit power to San Luis Potosí, as proposed, leaving the State to the Guanajuato concern. The agreement covers the States of Guanajuato, Michoacán, Jalisco, Aguascalientes, Zacatecas, and San Luis Potosí. The Chapala company will transmit power to Aguascalientes and Zacatecas, and will start work on the transmission line within a few months. It is estimated that the cost will be ₱1,500,000. The length of the line to Aguascalientes will be 180 kilometres, and from that point to Zacatecas 125 kilometres. The Asientos and Tepezala mining districts of Aguascalientes and the old Zacatecas district will be supplied. The Sultepec Light & Power Co., which recently started the transmission of electric power to the Seguranza Mining Co. in the Zacualpán district of the State of Mexico, is contracting with other concerns in the district, and may transmit power to the Taxco district of Guerrero. Taxco mining men are greatly interested.

The Amparo Mining Co., the only American concern of the State of Jalisco now on a dividend basis, had a production of ₱1,445,000 in 1909. Dividends of 2½% per quarter were paid on a capitalization of more than $2,500,000. Recently the company won a Chancery Court decision involving title to over 500,000 shares of stock held by the Paxon estate of Philadelphia, and this stock has been retired, leaving the capital $2,000,000. It is estimated that the company will this year earn 16% on the present capitalization, and dividends of 3% per quarter will be paid. The company will increase the capacity of its reduction plant more than 1000 tons monthly by the installation of two Krupp tube-mills, three Wilfley concentrators, two Dorr classifiers, one Dorr thickener, and three Pachuca tanks. An average of 5500 tons per month is now handled. Power is promised the company by the Chapala Hydro-Electric & Irrigation Co. in May, and a saving of more than half in operating expenses will result. The ore reserves in the Amparo mines are estimated at 365,000 tons, and the company has 45,000 tons of dump-ore. The Magistral-Ameca Copper Co. expects

to have its 100-ton concentrating plant, using the Elmore process, in commission in April. The crushing equipment is for a capacity of 200 tons daily, and the concentrating equipment will be increased to 200 tons within a year. Later a smelter will be built to handle the concentrate and some ore. The company owns the Magistral mines in the Ameca district of Jalisco, purchased for ₱100,000. The ore in sight comprises 35,000 tons that will assay better than 7% copper, and 150,000 tons that contain 4%. A 25-ton cyanide plant has been erected for experimental purposes by the Philadelphia Copper & Gold Mining Co. The company, which has been developing copper veins for several years, is now opening what promises to be a big gold-silver deposit.

The Nueva Luz shaft of the Mineral Development Co. in the Guanajuato district has reached a depth of 500 metres (1640 ft). The shaft will be put down to a depth of at least 2300 ft., when a cross-cut will be run to intersect the mother lode of the Guanajuato district. The fact that the shaft will prove the district at great depth interested the Government and secured for the company a subsidy. The company is controlled by the Mines Proprietary Company of



The Magistral Mine, Ameca, Jalisco.

America, which also controls the Tajo de Dolores enterprise in the Guanajuato district.

The Southern Pacific extension, building south, has reached the Santiago river in Tepic, 1004 kilometres from Guaymas. The construction forces are being transferred across the river, and the work of carrying the extension on to the city of Tepic, a distance of 96 kilometres, will be soon under way. The distance from the Santiago river to the end of the Southern Pacific track in the State of Jalisco is 271 kilometres (168 miles). In this stretch is included the 20 miles of canyon railroad that will require at least two years to construct and cost from $4,000,000 to $5,000,000. The Southern Pacific has in operation in Jalisco 61 kilometres of track, from Orendain, the junction with the National Railways, 25 miles from Guadalajara, to Magdalena. The National Railways has just let a contract for the construction of a railroad from the city of Durango west to Llano Grande, a distance of 100 kilometres. The line will be of benefit to some Durango mining districts. The mining interests of Mexico are following with much concern the controversy between the National Railways and the foreign employees, which threatens to result in a walk-out of all foreign conductors and engineers. The controversy is over a question of future employment, and is the result of an announcement by Minister Limantour that it is the desire of the Government to Mexicanize the merger roads. As the supply of Mexican engineers and trainmen is limited, a walk-out of foreigners will seriously affect freight traffic, and the mining industry will suffer as a result.

Oaxaca and vicinity suffered a rude shock a week or ten days past. It is hard to conceive of the great majority of the mines of a district the size and extent of Oaxaca all closing, or nearly all, seemingly with one accord, and all at the same time, with no previous arrangement or agreement. But that is just what happened. On January 26 the United States Banking Co., a local branch of the bank of that name in the City of Mexico, closed. Being the only bank managed by English speaking people in Oaxaca, it was the depository of practically all the mining operators in this section. The payroll had gone out for the week before to all the mines. The messengers had not yet come in for the following week. No one, with the exception of one fortunate owner, had the least idea that trouble was impending at the home bank, until the morning that the doors did not open. Even the local manager was uninformed. As the average Mexican mine laborer does not care to know anything about bank failures, there was a mighty gathering of managers to see where the money was coming from for the following Saturday payroll. Only money talks with the Indians, and it is not always safe to disappoint them. Telegrams were sent galore, and by hook or crook, all were provided with money, but the greater part of the work was closed that same night, to await receipt of money. In some cases of smaller prospectors work will stop till the bank reopens, and this may be a matter of months.

The recent decision of Judge Calderón, granting amparo in the appeal of C. A. Hamilton to recover the San Juan mine, again brings up this well known case, which is not wholly understood by the majority of mining men. The San Juan property consists of ten claims, located about 1902 in the heart of the Taviche district. The original and then owner was Juan Baigts, who was also owner of the nearby Escuadra group of mines. Mr. Hamilton was responsible for the forming of a company for the purchase of the Escuadra group in 1902, which company took them over on a payment of ₱100,000, a further payment of ₱350,000 to be made at a later date. About the same time another company, officered in part by the same men, took over the San Juan mines, on payment of ₱10,000, receiving a deed with a clause therein that the latter deal was contingent on the Escuadra purchase, and it is supposed that the San Juan property was merely given as a commission at a nominal price, to Mr. Hamilton and associates, for having engineered the Escuadra sale. The latter sale never went beyond the first payment, of ₱100,000, operators being forced to give up possession after having taken out probably much more ore than was in the original payment, but they did receive an extension of some months on the option, when the second payment was not promptly forthcoming. The last fact is supposed to have an important legal bearing on the claims of the Hamilton interests as to the validity of their title to the San Juan property. Mr. Hamilton, for the San Juan company, as soon as they acquired the property, began taking out ore, and during their occupancy of nearly four years, extracted in the neighborhood of ₱1,000,000, but soon after the sale of the Escuadra was declared void, Baigts began action for the recovery of the San Juan, alleging that the conditions of the transfer had not been fulfilled. In the early part of 1907 a decision was given, which had the effect, later in the year, of recovering for Mr. Baigts, the San Juan properties.

In the summer of 1909, Mr. Hamilton made a trip to the United States, and returned with L. R. Wilfley, well known in connection with the United States courts in China and the Philippines, who at once assumed active charge of the case in Mr. Hamilton's interest. Rumors are current that Mr. Hamilton reached the Presidential ear in securing the help of Judge Wilfley, which, however, is apart from the merits of the case. In November of last year, application was made in the district court of Mexico City, for re-opening of the case, commonly known as amparo. This was granted January 5, 1910. The decision of the lower court is now in the Supreme Court and if confirmed it will have the effect of re-opening the case, and may result in the recovery of the San Juan by Mr. Hamilton and associates.

This would have a wide influence on the Oaxaca camp. The work as conducted under Mr. Baigts' administration, has been with no idea of treating the low-grade ores, and

the property is not being developed for a treatment-plant. The fact of the property having been lost to Mr. Hamilton, has undoubtedly influenced others to suspend or drop meritorious properties, particularly with the non-completion of the Taviche railroad, which Mr. Hamilton was also exploiting. Now, however, the road is being completed by the Mexican Southern Railroad Co., and if Mr. Hamilton should recover the property, it would mean a vigorous revival for the Oaxaca camp. The merits of the case are very hard to analyze, and I have no desire to pass on the same, pro or con, but it seems certain that it would benefit mining in Oaxaca should Hamilton recover the property in litigation.

BUTTE, MONTANA.

January Production.—Zinc Mining. — Idaho-Montana. — Corbin Mines.

The Butte mines started 1910 with a monthly production of copper about 8,000,000 lb. below the normal, and production probably will be curtailed for some time by agreement. Because of labor troubles and other hindering causes the production in December was reduced to a little more than 14,000,000 lb., compared with a normal production of 28,000,000. In January it was increased to a little more than 19,000,000, and a few million pounds may be added in February, but under present conditions the production will be held down from 15 to 20% below the normal. A few of the mines in which the cost of production is above the average will remain closed. The total tonnage of ore and the production of copper by companies in January were as follows:

Companies.	Tons of Ore.	Pounds of Copper.
Boston & Montana	50,000	3,500,000
Anaconda	106,950	6,523,950
Butte & Boston	5,400	334,800
Washoe	6,200	378,200
Parrot	3,875	248,000
Trenton	12,400	744,000
North Butte	37,200	2,604,000
Butte Coalition	49,600	3,224,000
Original	15,000	990,000
East Butte	9,300	576,600
Miscellaneous	1,500	100,750
Totals	297,425	19,224,300

The growing activity in zinc mining in the Butte district has revived interest in the old Emma mine, once the property of the Butte Mining & Development Co., and now owned by the Butte Copper & Zinc Co. It has been reported that fully half a million tons of zinc ore is in sight in the mine, and that the ore carries a high percentage of that mineral. In order to make an examination of the vein and sample the ore a contract has been let to unwater the mine to the 200-ft. level. The shaft itself is 1200 ft. deep. It is possible, if examinations sustain the report of engineers, made some years ago, that new capital will become interested in the Emma.

Development is going on at the Raven mine, the shaft, an incline, having reached a depth of 1500 ft., at which point a new level is to be opened. This gives a vertical depth of 1300 ft., and ought to be deep enough to show an encouraging or discouraging condition of the vein, though it will hardly be deep enough to disclose commercial ore. The stockholders of the Ida-Montana Mining Co., at a special meeting, voted to transfer all of the property, consisting of three good claims on the east side of the Butte district, to a new company to be organized with a capitalization of $3,000,000. The reorganization was necessary in order to raise money with which to pay off the obligations of the old company and provide a working fund. The mine has been developed to a depth of 480 ft., and one level, at the 250, has been opened on the vein where some good commercial ore was found. The panic of 1907 compelled a suspension of operations. The Corbin Copper Co. will install the machinery for the first 100-ton unit of its concentrator as soon as it arrives. It was shipped from Milwaukee several weeks ago. The foundation for the mill has been completed, and the superintendent says there is ore enough blocked out in the Dewey adit to keep the mill running for nine months, while more ore is being added to the reserve at the rate of 110 ft. per month, the vein being fully 20 ft. wide. Another adit is being driven on the same claim farther down the hill, and another vein series is being developed on the opposite side of the gulch. The Robert Emmet Copper Co. is now supplying the Blue Bird mine, in the Corbin-Wickes district, with electric power. The Robert Emmet is also preparing to furnish power to other mines in the district. It is the first company operating there to install a complete power-plant of its own. The high-tension line of the United Missouri River Power Co. passes close to the property. The Michigan & Montana Development Co., operating the Blue Bird, is the largest shipper of the district. Its contract with the Robert Emmet is for five years and secures power at a cost of about one-third that of steam.

RHYOLITE, NEVADA.

Mayflower Con.—Bullfrog Pioneer.—Johnnie.—Tecopa.

At a special stockholders' meeting of the Mayflower Consolidated Mining Co., held at Rhyolite on February 5, a complete reorganization of the company was effected in directorate and management, the directors electing the following officers: Charles T. Dunbar, president; E. S. Drury, vice-president; Charles F. Ryan, secretary; and F. H. Stickney treasurer. The First National Bank of Rhyolite was designated as the stock repository and transfer office, instead of the Mercantile Trust Co. of San Francisco. In order to provide for the indebtedness created by the previous management a resolution was adopted authorizing the directors to lease or bond the property. Subsequently some of the principal stockholders organized the Mayflower Leasing Co., to which the directors granted a lease of the Mayflower estate for four years. The leasing company will assume all indebtedness of the mining company, and will pay 25% of the first profits to the treasury of the Mayflower Consolidated Mining Co., and 25% to liquidate its indebtedness until all is cancelled, when 50% of the profit will be paid as royalty. The leasing company is capitalized at 100,000 shares of the par value of $1, and a block of 30,000 shares if offered pro rata to the stockholders of the mining company until March 1 at par. A. Sydney Additon is consulting engineer and will have charge of mining operations. At the annual meeting of the Bullfrog Pioneer Leasing & Milling Co., held at Rhyolite on February 7, the following officers were elected for the ensuing year: F. H. Stickney, president and treasurer; Samuel H. Bradbury, vice-president; F. P. Hearns, secretary; and E. L. Jernaghan, assistant secretary. The company is now shipping five cars of ore of about 35 tons each per week. Extension of drifts in a northeasterly direction have opened on the 110 and 156-ft. levels a better grade of ore than has been found for some time. On the 110-ft. level a 30-ft. shoot of high-grade ore has been opened. A circular letter will be sent soon to the stockholders, containing reports of treasurer, president, superintendent, and chairman of executive committee. The mill of the Nevada Ore Treating Co. at Beatty is nearing completion, and will be in operation shortly. The Wiswell electro-chemical amalgamation process is to be used. It is reported that the capacity of the mill of the Crystal Bullfrog Milling Co., near Gold Center, is to be doubled. The management of the Johnnie Mining & Milling Co., at Johnnie, has undergone a change by which A. D. Myers and associates again come into control. The new officers are: L. J. Cristopher, president; A. P. Pohnson, vice-president; M. S. Gregory, treasurer; F. A. Johnston, general manager; with A. D. Myers on the directorate. It is claimed that the present output of the mine is 100 tons per day of ore assaying from $4 to $15 per ton, which is mined and treated at a cost of $3.50; and it is announced that the mill will be increased to treat 200 tons per day, practically requiring a doubling of the present equipment. In doing the annual assessment work on the property of the Tecopa Gunsight Mining Co., situated about six miles east of Tecopa, Inyo county, California, J. C. Kennedy, of Rhyolite, cut the apex of a blind vein of good shipping ore. The ore at present is

mainly lead carbonate, containing large chunks of galena, and assays well in silver with a small amount of gold. The company owns a group of nine claims joining the property of the Tecopa Consolidated Mining Co. on the north. Ore has been found in several places on the group. The latest and best find is near the Gunsight mine and lies in the same limestone which is here underlaid by a laminated granite cut at a number of places by dikes of diorite. The Consolidated company has finished its railway line to its mines, and has got in its own rolling stock, while the construction of the balanced tramway leading from the receiving to the loading bin is well under way. It is expected that the extraction and shipping of ore will soon be started.

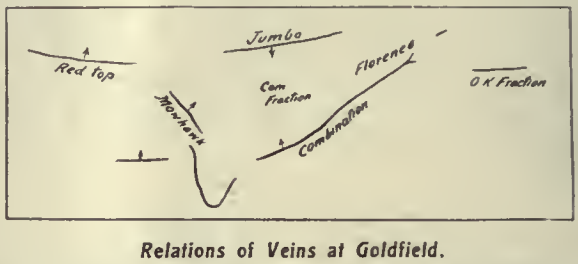
GOLDFIELD, NEVADA.

Copper Rumor False. — Consolidated Mill and Development.— Florence.—Poleverde.—Black Butte.—Yellow Tiger.—Sandstorm.—Kendall Consolidated.

Reports that copper is being found to replace gold in the ore at deeper levels of the Consolidated mines, are emphatically refuted by the manager, J. R. Finlay, and by others who are familiar with the geological conditions. Mr. Finlay gives the most convincing assurances that the copper content of the ore and the vein at the 1000-ft. level is no greater proportionately than elsewhere. The rumor has been used to bear stocks and has aroused widespread interest and no little alarm. It emanated from an irresponsible source. Copper, chiefly in the form of tetrahedrite, is present in nearly all the ore mined in the Goldfield district, but is negligible in quantity excepting for occasional small seams or nodules which afford samples rich in the metal. But one small shipment of ore has been made from which there was a return for copper. This came from a depth of out 150 ft. in the Victor workings of the C. O. D. Consolidated. Copper in larger proportion than elsewhere is found in the Victor, in the Annex shaft on the Poleverde claim, and in parts of the Florence mine, particularly in the workings of the former Rogers syndicate lease, south of the Florence hill. At the 200-ft. level of the Florence there is, in places, far more copper than at any point in the Consolidated mines. At no point, however, is the copper content sufficient to materially affect the treatment of the product. The Consolidated mill is reported to be treating over 850 tons of ore daily, and the mill heads have been maintained at nearly the former figure, above $35 per ton. A heavy production is now being made from the orebodies exposed in the Clermont where stoping is in progress at the 600, 750, and 900-ft., as well as at two intermediate levels. The orebody at the 750 has been opened to great width and affords reserves in volume far exceeding anything anticipated. On the 900-ft. level the vein has been opened for over 300 ft. showing ore of excellent quality for good width. It has not yet been cut at the 1000-ft. level, but another week's driving may bring the face of the drift into the ore-shoot. There has been no expectation that the ore would be cut before this time, despite the many published reports to the contrary, and the manager is authority for the statement that conditions of formation at the 900 and 1000-ft. levels are identical and there is no indication that the ore-shoot will be found less productive at 1000 than at 900 ft. George Wingfield, president of the Consolidated company, is now in Goldfield and will leave shortly, accompanied by A. H. Howe, for New York, to attend the regular quarterly meeting of directors. They will be joined at Reno, probably, by W. C. Ralston and J. H. Mackenzie, and it is expected that all the directors will attend the meeting which is of particular interest from the fact that the amount of the next and of future dividends will be determined upon as also the prospect of establishing regular payments of 50, instead of 30c., quarterly.

In the Florence mine the reserves of good ore are being constantly augmented by development. Willis Lawrence, the manager, is having the large stopes near the Little-Florence shaft filled with broken ore with which to supply the mill over the aerial tramway during the time when the work of enlarging the main shaft is in progress. Stopes of large size are being opened near the main workings and two of the strongest ore-shoots are being mined at three levels. He says that two machine-drills are breaking sufficient ore to supply the mill, which is treating over 160 tons daily, and that enough ore is broken and ready to hoist to occupy the plant to its full capacity for over two months, with additional reserves blocked and in condition to break at short notice sufficient to run the mill for several months. At the northern extremity of the Florence claim the ground formerly embraced in the rich Reilly lease is being opened from a drift at the 350-ft. level. All of this lease's production of nearly $1,000,000 in high-grade ore came from above the depth of 260 ft. Immediately adjoining the boundary line the Consolidated miners are stoping ore from this vein at the No. 4 and No. 5 levels.

Driving on the vein exposed near the 800-ft. level of the Annex workings on the Poleverde claim will be begun immediately upon the completion of the large station at that depth. In cutting the station the ore-shoot passed through by the shaft in sinking, has again been found, and shows 5 ft. of ore averaging above $50 per ton. The shaft will be continued to the 1000-ft. level at least, and a second cable has been placed on the double-drum hoist to permit of sinking and driving simultaneously. The Grizzly Bear shaft, on the Jumbo, is down 945 ft., and it is expected,



Relations of Veins at Goldfield.

from indications in the Clermont, that the hanging wall of the Mohawk vein will be penetrated near the 1000-ft. level. The shaft is being sunk 5 ft. daily with three shifts and power-drills. The ore-shoot recently opened in a winze on the Diamondfield Black Butte will be tapped by means of a raise driven from the lower tunnel in the hill on the north side. The vein has shown consistent improvement in the winze, carrying 36 in. of pay-ore some of which has assayed $500 per ton and the walls, porphyry and quartzite, are well defined at the deepest point reached. The reorganization of the Black Butte company on the assessable stock basis is progressing and is meeting with a gratifying response from stockholders, many of whom are sending in their shares for exchange, accompanied by the additional payment required of 1c. per share. The Combination Fraction shaft is nearing a depth of 800 ft. under the supervision of the new manager, Charles D. Wilkinson. Operations have been resumed on the Yellow Tiger and the shaft is being unwatered below the 700-ft. level where a vein of large size and containing ore of medium grade was developed at a point 380 ft. west of the shaft. The re-constructed company, headed by John F. Campion, of Colorado, has provided a fund of $50,000 for further work. W. F. Gray and B. E. Thomas are sacking ore of excellent quality in the Gold Bar workings of the C. O. D. Consolidated, upon which they have a five-year lease. Mr. Thomas will go, in a few days, to Denver, where experiments on a quantity of the ore are being conducted to determine the character of mill to be installed by the lessees. This mill will also treat the product of the Thomas lease on Columbia mountain where a raise will be driven from the 1100-ft. tunnel to reach the ore-shoot opened at 140 ft. in the shaft. The manner of organization of the Sandstorm-Kendall Consolidated Mining Co. has been determined and will be carried into effect at once. The John S. Cook bank, of which Mr. Wingfield is president and to which the two mining companies owe over $50,000, will proceed at once to secure a judgment against the companies. The property will be turned over to Wingfield for the sum of the indebtedness. The companies will then be merged under the above name and re-incorporated upon the assessable stock basis with 1,500,000 shares exchangeable at equal value for the old stock.

LONDON.

West Coast of Africa and G. A. Stockfeld's Work.—Taquah and Abosso Show Good Results.

The African West Coast now occupies a good deal of the attention of the London mining market. In much that has been written recently on the subject, I do not consider that enough has been said about the services of G. A. Stockfeld exerted in the proper opening up of this country. Mr. Stockfeld has been associated with the country continuously for a longer period than most engineers that have been there, and he probably knows more of the country than anybody now living. It was entirely due to his success in the Tarkwa district that the Consolidated Gold Fields, Wernher, Beit & Co., and others came to the conclusion that the adjoining properties should be developed and purchased. A history of the work done by Mr. Stockfeld's companies, the Taquah and the Abosso, is interesting reading at the present time. These two mines were originally brought to the notice of English investors as long ago as 1888, during the first of the three West African booms, and for many years with indifferent results. However, since 1901 when the two mines were taken over by separate organizations progress has been rapid. The report of the Taquah for the year ended June 30, 1909, shows that operations have been considerably impeded by shortness of labor, and the mill was not working more than 67% of its capacity. The amount of ore treated was 56,793 tons and the production in the mill and cyanide plant was 37,197 oz. realizing £157,904, being an extraction of 13.09 dwt. or £2 15s. 7d. per ton. During the early months of 1909 the mill ran below its capacity, but since the close of the financial year conditions have greatly improved. Under the circumstances it has not been possible to reduce the cost to the extent contemplated and naturally the profits have been less than if the mill had been at work continuously. The mining cost was £111,555 and £18,457 was allowed for redemption of development account. After paying London office and other expenses, a balance of profit of £24,381 was made on the year's work. The sum of £22,859 was written off for depreciation, and on the other side of the account there is the additional income of £12,000 being a dividend of 10% on the company's holding in the Abosso company. The company began the year with a balance in hand of £56,748, and £38,747 has been distributed to shareholders and holders of income boards, being at the rate of 10% on both classes of holding. The sum of £13,971 is carried forward. Mr. Stockfeld reports that during the year under review the development work has consisted chiefly of sinking another shaft to the south of the main shaft and making the necessary connections between the two. He intends to commence a third shaft to the north and to work the three conjointly. At the present time only 40% of the length of the lode has been exploited, but with the three shafts the entire length will be opened up. The main shaft is now down 1096 ft. and the levels No. 6 and No. 7 are being developed. The ore reserve on June 30 was estimated at 141,187 tons averaging 15.6 dwt. The company has sold its dredging rights on the Ancobra river to the newly formed Ancobra Exploration & Dredging Co. During the year Arthur Wilkinson, acting for Wernher, Beit & Co., paid a visit of inspection to the Taquah and Abosso mines and reported in flattering terms on the mines and the method of development.

The Abosso mine is at a short distance from the Taquah, and is separated from it by the Abbontiakoon and the Fanti. The report for the year covering the same period shows that 60,702 tons of ore yielded by amalgamation and cyanide 32,607 oz. of gold of the value of £138,466, the extraction being 10.74 dwt. or 45s. 7d. per ton. Trouble has been experienced at this mine as well as at the Taquah, owing to the shortage of labor. Rock-drills had to be used for stoping and close sorting was impossible, so that the average ore sent to the mill was of lower grade than it would have been had more labor been available. Also some repairs had to be made in the battery foundations. These two causes made the output of the plant less than usual. Since the end of the year covered by the report, better labor supplies have been obtained, and the output costs and profits are normal. The mine is opening well and the reserve, on June 30, was 350,888 tons of milling ore averaging 14.4 dwt. The main shaft is down 1379 ft. and the vein is strong and continuous on all the levels from the No. 6 to No. 9. At the 1300-ft. level No. 10 has been commenced and is giving good results. The prospects are so good that Mr. Stockfeld has recommended doubling the number of stamps from 50 to 100, the new stamps to be 1500 lb. in weight as compared with 1250 lb. in the present mill. The enlarged plant will then treat 200,000 tons per year. In order to provide the necessary funds 50,491 shares have been issued at 41s. each and sold among the present shareholders. It has been decided also to erect a slime-plant, and experiments are being made in re-grinding with a view to increasing the capacity of the plant. During the year under review the cost at the mine was £81,861 and £13,657 was charged against development. The allowance for depreciation, etc., was £13,246 and taxes absorbed £5459. The dividends paid have amounted to £54,950. The outlook for this company is excellent, and the only cause for anxiety is the supply of labor. However, as the association for recruiting has been formed and the active support of the Government has been given, this disadvantage will be overcome.

DENVER.

Accidents in Mines.—Cripple Creek News.—Isabella and Portland Annual Meetings.

On January 16 a peculiar accident happened to the miners who were trimming the sides and roof of the Gunnison tunnel. They had placed several shots and had retreated to a safe distance. The force of the explosion reversed the air current, and eleven of the men engaged in the work were either smothered at once, or so badly overcome by the gases that they died in a few days. The explosion at the Primero coal mine in the Trinidad field on January 31 was the worst that has occurred in Colorado for some years. At least seventy-five men were killed. On January 29, 1907, a similar explosion in this mine killed twenty-four men. Knowing that the mine was dangerous, the Colorado Fuel & Iron Co. had taken every possible precaution as regards ventilation, safety lamps, and mine regulations. The State mine inspector had examined the mine in December last and pronounced it in first-class condition. The cause of the explosion may never be known.

The Cripple Creek deep drainage tunnel advanced 282 ft. during January, and is now in 12,378 ft. from the portal. It is estimated that it will take eight months to complete the remaining 3122 ft. to the main water course of the district. The production from the camp for January amounted to $1,290,440, which was very satisfactory considering that the surface work and hauling had to be suspended on many days because of the intense cold. Three companies paid dividends in January, amounting to $112,500. The Doctor-Jack Pot has announced a one-half cent per share dividend payable March 1. The Midget-Bonanza Gold Mining & Milling Co. of St. Louis, has purchased the properties of the Midget Mining & Milling Co., and the Gold Hill Bonanza Mining Co., in the Cripple Creek district. The property contains about 30 acres situated on Gold hill. The Midget is one of the best small producers in the camp, and sends its milling ore to the Gold Issue mill two miles distant by aerial tram.

Reports of a find in the Isabella mine have been freely circulated of late. It was said that 'picture ore' of the same high value as that of a famous shipment which realized in excess of $200,000 for one single carload had been found. The ore is reported as coming from the 1000-ft. level of the Lee shaft. The report is evidently wrong as the only work of any importance that is being done is between the third and fourth levels from the Lee shaft, where moderately good returns are being obtained. The Empire ground of the Isabella company is under lease to the Western Investment Co. In Cheyenne, Wyoming, on February 7, the Portland and Isabella annual meetings of stockholders were held. While the Portland meeting developed no sensation and resulted in the returning of the old board of directors, there was a protesting faction in the picturesque figure of James F.

Burns, who has opposed the present management since the time that he was deposed from the presidency of this company several years ago. Mr. Burns loudly declaims against what he characterizes as 'company mismanagement', and freely predicts that the new Portland mill will not successfully handle the ore. This is in keeping with his 'rule or ruin' policy. The Portland company's net earnings for 1909 were $425,444, of which $350,000 was distributed in dividends. The gross production was 83,908 tons of a value of $1,438,650. The Isabella meeting developed a contest which is still in the hands of the credentials committee, with a duplication of several hundred proxies which are going into the 'trouble pile' for subsequent consideration. A *viva voce* vote was taken at the meeting in respect to a substitute motion in which James F. Burns sought to increase the number of the credentials committee to three persons. This show of strength developed the fact that the Burns-Hays factions, which are allied in this contest, were in minority and no third member was elected to this committee. While the votes represented showed largely in excess of the total outstanding stock, this was accounted for by proxies subject to revocation on both sides. Thomas Kelley, E. E. Guentin, A. J. Stybr, A. C. Gardner, and Tyson Dines were finally elected as directors. The annual report of the Isabella Mines Co. shows a cash balance of $81,434. The gross receipts from ore sales for the year are given at $187,542, and total expenditure aggregated $204,516, showing a deficit in mine operation for the year 1909. In his report Mr. Kilborn, the manager, announces that the indebtedness of the company to the extent of more than $100,000 has been paid in the last few years, a cyanide mill has been built and paid for, and additional machinery has been installed in the mine. The meeting of the El Paso company is expected to be bitterly contested between the Burris and Bernard factions. This meeting will be held in Cheyenne in the next few days. The holing that was made from the Burleigh tunnel and west Phillips drift into the shaft workings of the Seven Thirty mine early in December has left in its wake so much rock and refuse that the Burleigh bore is blocked for nearly 3000 ft. The west Phillips drift is badly wrecked and numerous caves will have to be caught up before the production from lessees in the mine can be handled through the main tunnel. It is estimated that it will require 60 days to clean up and get working access to the lower workings of the Seven Thirty vein. Several of the lessees, particularly those operating at the zero level on the Seven Thirty, report a good showing and high assays in silver ores.

NEW YORK.

Copper Producers Figures.—Golden Cycle Sold.—Campo Morado and Tajo de Dolores.—Ely-Central.

The showing made by the figures of the Copper Producers' Association given out February 10, are gratifying, and a much firmer tone is anticipated in the copper metal market. While it was expected that a healthy decrease in surplus stocks would be shown, probably about 30,000,000 lb., it was thought that such result would be due in no small part to curtailed production. It is something of a surprise, therefore, to note that, while surplus stocks have been cut down something more than 43,000,000 lb., such inroad was made not through a cutting down of production but by a wonderful increase in consumption, both for domestic account and for export. Production for the month just past was 116,547,287 lb., as compared with December's production of 117,282,655, showing only a nominal curtailment of 1,281,368 lb. The consumption for January for domestic account was 78,158,387, as against a consumption in December of 69,519,501, an increase of 8,638,886 lb. A still greater increase in consumption was scored in the account for export, being for January, 81,691,672, as against exports for December of 59,540,570, an increase of 22,151,102 lb. The figures show that there was a rush of metal abroad toward the close of the month, which was too late to get into the Government export reports. The cutting down of surplus stocks is the first material inroad made in the copper surplus since last July, when there was a decrease of 32,261,454 lb. The forecast is for a further lessening of production for the present month, and were it not for the large accumulations of copper abroad, there would unquestionably be a sharp advance in the market, and 15c. copper is expected before midsummer. A strong market for copper is one of the prequisites to successful flotation of the much discussed copper merger, as it will be necessary to show the public a profit in the operation of some of the high-cost producers that must of necessity be taken into the consolidation. As to the copper merger itself, it seems to be pretty generally taken for granted that the larger plans have been shelved indefinitely. The Guggenheim interests appear to have abandoned efforts to secure complete control of Nevada Con., while as to the plans for the enlarged Anaconda company, no further steps can be taken until the meeting of the stockholders to be held March 23. Adolph Lewisohn resigned from the board of directors of the British Columbia Copper Co. at the annual meeting held on Tuesday of this week. John T. Milliken, of St. Louis, announces that he has sold the Golden Cycle of Cripple Creek to the Consolidated Goldfields Co. of London, on a basis of $4 per share for the 2,000,000 shares. In the deal Mr. Milliken, with whom is associated Frank G. Logan, formerly of the firm of Logan & Bryan, has formed a syndicate for the underwriting of one-third of the stock. They and their associates have completed the purchase of the Provincial mine at Cobalt, and have organized the Cobalt Provincial Mining Co., Limited.

Advices by letter from Mexico City state that the engineers of the Exploration Co., Ltd., of London, have completed their examination of the Campo Morado, in the State of Guerrero, Mexico; and that, upon the report, the Exploration company has offered José M. Ortiz $8,000,000 gold for the property. The price asked by him is $10,000,000, and mining men who are familiar with the property have been offering to wager their friends in the Engineers' Club here that the offer will be rejected. American shareholders of Camp Bird, Ltd., were sent application blanks and notified that all shareholders would have preferential treatment in the issue of new shares and debentures. These blanks reached the United States about January 10 to 15. Those who promptly filled them out and returned them to the company with checks were advised that their applications were too late, the books having closed January 6. The machinery for the mill being erected at the Tajo de Dolores mine at Guanajuato has been ordered, and Mr. McCord, the manager, has returned to Mexico. The mill will have 250 tons daily capacity, with 40 stamps set for coarse crushing; Diester concentrating tables; Schmidt tube-mills; Pachuca tanks, and Sweetland filter-presses. The iron and steel parts have been bought from the Midvale Steel Co., the Chrome Steel Works, the Hammond Iron Works, the George E. Cresson Co., and the El Paso Foundry & Machine Co. Twelve Westinghouse motors will be used; the compressor plant is furnished by the Ingersoll-Rand Co., and the conveyor plant by the Robins Conveying Belt Co. The funds for the erection of the mill are being furnished by the Proprietary Mines Co. of America, the holding company which also controls the Mineral Development Co., operating the Nueva Luz mine in the same camp. The Nueva Luz shaft is reported to be now 1687 ft. deep.

The articles appearing in *The Engineering & Mining Journal* on November 6, 1909, and previously, relating to the Ely Central Copper Co. and the manner of its promotion and the personnel of the promoters, B. H. Scheftels & Co., are made the grounds for lawsuits against the periodical by B. H. Scheftels & Co. and by its president, B. H. Scheftels personally, for $750,000 and $100,000 respectively. The good faith of *The Engineering & Mining Journal* in the publication of the articles mentioned is attacked, and the claim is made that such publication was for the purpose of depressing the market in the stock. The episode created a great deal of discussion at the time, and the market in Ely Central sold down from $4 to $1.50. The ensuing controversy was such that the stock has never recovered its former price-levels. It is now stated that B. H. Scheftels & Co. intend to use the recently completed report of Walter Harvey Weed as ammunition in proving the statements made by *The Engineering & Mining Journal* to have been without foundation.

General Mining News.

ALASKA.

Joseph H. Houston, and associates of Seward, have secured four sections of hydraulic and placer ground suitable for dredging along the line of the Alaska Central railroad, about 23 miles from Seward. The ground has been thoroughly prospected and the operators have acquired two water rights, giving an adequate supply for hydraulic mining. New hydraulic equipment will be installed and a dredge erected on the property this spring.

ARIZONA.

COCHISE COUNTY.

The orebody that was opened recently on the 400-ft. level of the Copper Queen property at Bisbee, between the Czar and Holbrook shafts, has been found in drift No. 364 on the 300-ft. level, and work has now been started to cut the same shoot on the 500-ft. level. The drift on the 600-ft. level of the Spray shaft to the Holbrook has been completed and a pump-station is being cut. At the Sacramento 2010 tons of ore have been hoisted in two 8-hr. shifts, and as soon as the chute is finished on the 1400-ft. level of the Lowell shaft, all the ore will be hoisted this way.——A new level has been started at the 450-ft. point in the Mag shaft of the Calumet & Arizona property.——At the Briggs shaft of the Superior & Pittsburg, sinking has been stopped temporarily at the 1200-ft. level, as considerable water has been found and new pumps will be installed to handle the extra flow.——The adit of the Bisbee-Sonora Mining Co., in the Bisbee district, is nearly completed. The ore will be cut at a depth of 275 ft., and the company is preparing to ship a large amount of high-grade ore that has been stored on the upper dump.——The new hoist has been installed at the Bisbee Extension and sinking resumed at the 600-ft. level.

GILA COUNTY.

(Special Correspondence).—The 185-hp. hoist has arrived at the Inspiration Copper Co.'s tunnel site in Keystone gulch, and is now being installed, the concrete foundation having been completed for several days. At the Joe Bush shaft, the new 60-hp. hoist installation is well under way. Ten mine cars and two skips have just arrived at this shaft. T. R. Drummond is general manager.——Timber sets for the second tramming level are being put in the No. 4 shaft of the Miami Copper Co. The capacity of the concentrator now under construction will be 3000 tons of ore per day, the foundations for three additional units being under construction at the present time. The foundation work for the engines to be installed in the new power house is well under way and the setting of the concrete for the walls of the building has been commenced. On the 370-ft. level of the mine, driving toward the Captain claim, at the southwest corner of the property, is in progress, but this work has not yet reached the orebody drilled into at this part of the property by the churn-drills.——Five working faces are being advanced on the 300-ft. level of the Live Oak property. Four of these are drifts and the fifth is a raise, now 90 ft. high. All five of these workings have been in ore assaying about 2.7% copper. A 10-drill air-compressor which arrived last week will be installed at the Sulphide adit within a few days and two 100-hp. boilers are expected to arrive soon. A. Ball is superintendent.——An inclined, double-compartment shaft is to be sunk on the Old Dominion vein at the Arizona-Michigan property to connect with the drift from the 500-ft. level of the Telfair shaft, about 950 ft. northward. N. A. Nelson is superintendent.——Shipments of 50 tons per day of 9% copper ore are being made regularly by the Superior & Boston Copper Co. to the Arizona-Commercial smelter, situated a short distance west of the McGaw shaft, through which all of the ore from the Superior & Boston mine will be hoisted in the future. Two levels have been established from this shaft, one at a depth of 400 ft.; the other at 600 ft. Most of the ore shipped is being mined at the 600-ft. level near the Great Eastern winze which connects the two levels and follows the Great Eastern vein 30 ft. below the sixth. Sinking will be resumed in the McGaw shaft as soon as the 1000-gal. pump has been installed at the sixth level and a 30,000-gal. sump has been cut. J. D. Wanvig is superintendent.

Globe, February 11.

MOHAVE COUNTY.

The Gold Road mill, which was very much hampered throughout December and a part of January by the unusually severe cold, has picked up steadily the last 15 days and is now shipping precipitate aggregating $60,000 per month. Nearly all the ore is being drawn from the 500-ft. stopes and since the ore blocked out in the three lower levels is known to be of a better grade, the mill output is expected to increase from this time. The No. 2 air-shaft, 700 ft. west from the Billy Bryan shaft, is down 29 ft., and is being equipped with hoist and machine-drills preparatory to sinking about 600 ft.——E. H. Barton, superintendent of the Gold Crown mine at Union Pass, is making an examination of the Ruth mine in the Silver Creek district for a New York company.——The Bi Metal mine is no longer under bond to John Hays Hammond. The manager, E. M. Lamont, returned from a final conference with B. F. Keith representing Hammond in Los Angeles, and announced that though the mine had held up to all examinations, terms could not be agreed upon. Mr. Lamont left at once for Denver to arrange for the erection of a larger mill, which will probably include 40 stamps and four Huntingtons.——The Bellflower prospect, three miles west of the Bi Metal, has been bonded by Rothe & Jones to H. M. Bowen and associates of Los Angeles.——S. R. Porter, of Los Angeles, has put a small force of men at work at the old Keystone mine pending the arrival of machinery, several cars of which are already on the way.——The Golconda zinc mine paid its fifth dividend of 1c. per share on February 10.

CALIFORNIA.

EL DORADO COUNTY.

Work is soon to commence upon the Lady Edner mine, a new property near Omo ranch, which has excellent prospects.

KERN COUNTY.

(Special Correspondence).—F. E. Norton, who is operating a lease on a portion of the Butte mine, received $250 from a run of 2½ tons that he sent to the mill last week.——The return on 24 tons from the lease of Edward Shipsey on a portion of the Butte property amounted to $1400.——While doing the assessment work on the William R. claim, of Houser, Byrne & Williams, Frank Feldman, who has a two-year lease on the property, took out four tons of ore that milled $450.——This week C. G. Illingsworth sent 10 tons of ore from the Pearl Wedge mine, in the Stringer district, to the mill for which he received $1700. This is the third lot of ore from this property that has been milled since last November, the other two netting $1800 and $1300, respectively. The present discovery was opened when cutting into the foot-wall on the 79-ft. level. The property is credited with a production of $200,000 since 1898.——Work is being continued at the Merced property adjoining the Pearl Wedge.——The Carona Mining Co. has shipped a lot of ore from its property to the Red Dog mill at Johannesburg to test its value.——The adit being driven by Gunderson Brothers on the Golden Link property, in the Stringer district, has cut a large body of low-grade ore.

Randsburg, February 14.

NEVADA COUNTY.

The Morydena Mining Co. is planning to resume operations at its property on Kentucky ridge southwest of Grass Valley. Preliminary work has been started, and in a short time an adit will be commenced that will cut the ore opened by the old shaft at considerable depth.——At the Pittsburg the mill is idle, temporarily, while the ore recently opened on the 1000-ft. level is being further explored. The shaft is down 1060 ft., and a cross-cut will be driven to the vein as soon as it reaches the 1100-ft. level. Both north and south drifts on the 900 and the north drift on the 700-ft. levels are being advanced with good results.

PLACER COUNTY.

A 4-ft. vein has been opened on the Kenyon ranch two miles from Auburn. A prospect shaft has been started on the ore which assays from $10 to $57 per ton.

SAN BERNARDINO COUNTY.

(Special Correspondence).—The Stanford Mining & Milling Co. is installing new machinery, including a Woodbury concentrator, at its Red Dog mill in an effort to save the tungsten occurring in its ores. The company operates the Stanford, Napoleon, and Gold Coin mines in the Stringer district. A small vein of ore, reported to run $300 per ton, has been opened in the Gold Coin mine. C. P. Christensen is manager.——The Bagdad Mining & Milling Co. is arranging for active work on the Orange Blossom. The shaft is down 600 ft. and will be sunk deeper. It is expected to keep a portion of the 20-stamp mill in operation while developments are going on.——The Eastern interests which recently took over the Eagle Mountain iron deposits are arranging for work along extensive lines. The deposits are the largest known in this portion of California.——The capacity of the Needles smelter is being increased from 150 to 400 tons per day. A 100-ton concentrator will be built;

also a plant to treat zinc and base ores. It is expected to have the plant in operation in May. The old unit will continue to treat ore while the construction of the new addition is under way. L. D. Godshall is manager.——The Yellow Aster officials state that the capacity of the plant will be increased and operations at the mines conducted on a larger scale.

San Bernardino, February 14.

SHASTA COUNTY.

The executive committee of the Shasta County Farmers' Protective Association, together with the Association's attorney, T. W. H. Shanahan, conferred with George W. Metcalfe, general manager for the Mammoth Copper company, and D. G. Reid, of Redding, and Alfred Sutro, of San Francisco, attorneys for the company. An agreement was reached upon the matter that is to be incorporated in the complaint in a friendly suit that is to be brought in the United States Circuit Court in San Francisco. An agreement was also reached as to the answer that would be filed to this complaint. Upon this complaint and answer will be based the decree of the court, containing all the provisions of Judge Marshall's decree in the Utah smoke case. In addition it was agreed that the farmers would waive no claim for damages that have accrued from smelter smoke or that may accrue before the installation of the bag-house, or smoke-consuming device, at the smelter at Kennett. This is to be in operation on or before July 1. T. W. H. Shanahan, as attorney for the Association, is to have 90 days in which to prepare and file the complaint and the answer will be filed practically at the same time.

TUOLUMNE COUNTY.

(Special Correspondence).—The North Fork Mining Co. is installing a 2-stamp mill at the Donelli mine, near Arastraville. The property has been extensively developed and the outlook is said to be good.——Milling the Confidence mine dump has been commenced, 20 stamps being used.——The Ralph mine, situated two miles northwest of Tuolumne, has been bonded to R. H. Fordsman, of Sacramento, and operations will be commenced at once with Charles Saunders, of Soulsbyville, as superintendent. It is the intention to install new machinery at the earliest possible time.——A compressor has been installed at the Rising Sun mine, near Arastraville, and machine-drills are being used for the first time.——Work has been commenced at the Nervi mine, above Columbia, with a small crew of men. The property was recently bonded to a company of Italian capitalists.——It is expected that the large crew of men making extensive repairs to the mill at the Black Oak mine will finish the work in a few days, when milling operations will be resumed.——A new 30-hp. motor has just been installed to operate the Draper mill, which has been thoroughly overhauled and started again.——It is reported that a discovery of sufficient importance to insure the resumption of operations has been made in the Republican mine.——Hoisting machinery for the Golden Dawn mine, situated one mile west of Soulsbyville and owned by Nicholls Brothers and Thomas Webster, has arrived at the property and development work will be resumed.

Tuolumne, February 14.

COLORADO.

CLEAR CREEK COUNTY.

(Special Correspondence).—A shipment of 43 tons of lead-zinc ore sent to the Linn mill last week for separation resulted in 31 tons of zinc and two tons lead concentrate. The zinc was sold for $48 per ton, while the lead brought $72. R. J. O'Connell, the operator, expects to ship 100 tons per month.——Shipments of smelting ore were started this week from the Capital mines, the product being valued at $140 per ton gold, silver, lead, and copper.——During the next week a big force of men will be put to work at the Scepter adit on Democrat mountain. The workings are to be placed in safe condition, while the grade of the adit will be reduced to 1%. The raise being put through to connect with the Sunburst workings will be completed during the next 30 days.

Georgetown, February 12.

(Special Correspondence).—Work has been resumed upon the placer ground below the Silver Age mill by F. Annis & Co. Operations will be carried on through three shafts that were sunk last year and where pay gravel is exposed.——Ericson & Co., leasing on the 100-ft. level of the Gem mine, have opened an 18-in. streak of smelting ore that is worth $65 per ton in gold.——Barnard Bub & Co., of Denver, have started work on the Barbarossa property on Floyd hill.——An agent for the North American Smelter & Mines Co. has been in camp during the last week signing contracts with mine owners for ore to be delivered at the pyritic smelter at Golden. The furnaces will be blown-in March 1. G. G. Vivian has been appointed general manager of the plant.

Idaho Springs, February 12.

GILPIN COUNTY.

(Special Correspondence).—Laterals are being driven from the Newhouse tunnel on the Illinois, Roderick Dhu, and Dyke veins. A fine body of ore is exposed on the last named property. Work in the breast of the bore has been suspended for the present.——A local pool has secured a lease on the Star of the West mine in the Russell district.——Cecil C. Morgan, manager for the Great Bonanza Gold Mining Co., (Ltd.), has taken over the Foot & Simmons

property in the Gregory district.——A gold retort weighing 79 oz. was sold last week to the Rocky Mountain bank. The gold was secured from the ore being mined from the Egyptian mine on Quartz hill, the product being treated in the Fifty mill at Black Hawk.——The Pearl Tatum Gold Mining Co. last week sold a gold retort weighing 53 oz., a clean-up from Sleepy Hollow ore which had been treated at the Fifty mill. Floyd Weed is manager.

Central City, February 11.

TELLER COUNTY.

The Western Investment Co., operating the main shaft and workings of the Mary McKinney Mining Co., on the Republic claim, made a production of 725 tons during January with a gross bullion value of $18,125. This ore was chiefly mined from the main Mary McKinney vein, northeast of the shaft at the bottom of the 650-ft. level. Fogleman & Roach, the lessees of the W. P. H. mine, of the United Gold Mines Co., have finished sinking with the main shaft down about 600 ft. The work of cutting the station at this depth has commenced and when completed cross-cuts will be driven to the two new flat veins met in sinking. These veins have produced high-grade ore in the Jerry Johnson mine adjoining the W. P. H., and though the assays obtained from samples taken from the W. P. H. shaft were low, the shoots should be cut when the veins are opened. ——At a meeting of the directors of the Doctor-Jack Pot Mining Co., held at Colorado Springs on February 5, dividend No. 6, was declared payable on March 1, to all stockholders of record of February 20, at the rate of ½c. per share. The amount to be distributed is $15,000.——The Gold Sovereign mine, on Bull hill, operated by the Clements Leasing Co., and sub-lessees, produced during January 28 cars of ore or about 850 tons, assaying from $10 to $25 per ton.

IDAHO.

IDAHO COUNTY.

The west drift from the cross-cut adit at the Golden Crown property, in the Elk City district, recently opened four feet of ore that assays over $27 per ton.

OWYHEE COUNTY.

Arrangements are about completed for the erection of a sampling plant and reduction works in Silver City. It will be equipped with machinery for working any kind of ore, and will give an opportunity for many miners to work the different prospects surrounding Silver City, and to get their ore treated at a low price.

SHOSHONE COUNTY.

(Special Correspondence).—The Caledonia Mining Co., operating in the Coeur d'Alene district, has interested Eastern capitalists and a syndicate, headed by United States Senator Carter, has secured 520,000 shares at a price ranging from $1.50 to $1.67½. The company is capitalized at $1,500,000, of which 200,000 shares are in the treasury. There will not be any change in the management, but E. J. Carter, brother of the Senator, has been selected as vice-president in place of John Keating, who has resigned. The property has been under development for two years, during which time about $150,000 worth of ore has been shipped and of this amount not less than $30,000 worth was sent out last month. It is stated that the company is in good financial condition and in a position to start paying dividends at any time.——The East Snowstorm mine, which adjoins the Snowstorm, has resumed operations after a suspension of two years brought about by the financial depression at that time. An adit is now in 315 ft., and the vein, which has been cut twice, is said to have a width of 28 ft. It is estimated that more than $300,000 worth of ore has been blocked out, and it is proposed to drive the adit 200 ft. farther to explore another vein.

Warren, February 12.

MONTANA.

BROADWATER COUNTY.

(Special Correspondence).—The Keating Gold Mining Co., operating near Radersburg, is engaged in installing a complete new surface plant which it is expected will be in operation the latter part of next month. The new machinery will include an electric hoist and air-compressor. High-grade ore is now being mined, and the last 10 cars shipped to the reduction works at Butte gave an average net return of $10,000. As soon as the new plant is in operation the shipments will be increased to 250 tons per day. The company announces that it is intended to issue frequent statements to the stockholders showing the receipts and expenditures, and whether or not a profit is being made.

Radersburg, February 11.

JEFFERSON COUNTY.

(Special Correspondence).—The farmers of the Boulder valley are threatening to give F. Augustus Heinze trouble and possibly tie up the operations of his concentrator at Basin. A meeting of the ranchers has been held and a preliminary organization effected with a view to bringing proceedings to have an injunction secured against the management restraining the company from running waste into the Jefferson river, which it is claimed renders the water unfit for use. Three prominent attorneys have been engaged and are now at work on the papers. The people of Basin are much worked up over the proposed action, as the men employed in the concentrator are really the life of the little town, and should the ranchers succeed in their action and the concentrator be compelled to close down, a large number of men will be thrown out of work. ——The Robert Emmet Copper company, in the Corbin-Wickes district, has announced its intention to build a concentrator at once. The company has been carrying on development work for the past two years and has a shaft 350 ft. deep. Two levels have been opened at the 200 and 300-ft. levels. Two veins, 5 to 15 ft. wide, containing 3% copper, 60 oz. silver, 5% lead, and $1.10 gold per ton are found. The shaft is now being sunk to the 500-ft. point, at which depth another level will be opened.——The Corbin Copper company, two miles west of Wickes, is expected to have its concentrator in operation the latter end of April. The Corbin company owns 51 claims with a total ground of about 1000 acres. Many of the claims are heavily timbered and there are also some valuable water rights with sufficient water available to supply a 1000-ton concentrator all through the year. The rock somewhat resembles that found in the mines of Butte.

Basin, February 11.

MADISON COUNTY.

(Special Correspondence).—One of the largest dredges in the United States is to be installed on the property of the Conrey Placer Mining Co., at Ruby. An order has just been placed for a dredge to cost $250,000 that will dig to the depth of 60 ft., and will handle 200,000 cu. yd. of gravel per month. The company has every confidence in the future prospects of dredging operations at the mouth of Alder gulch.

Ruby, February 11.

SILVER BOW COUNTY.

(Special Correspondence).—The Butte & Superior is shipping about 200 tons of ore at present and expects to increase the output to 400 tons per day very soon. Plans are being drawn for a machine shop and dry room which will accommodate 200 men.——The Butte-Alex Scott has struck a body of ore on the 1400-ft. level averaging 6 to 7% copper, and although this orebody has been cut 10 ft., the other wall has not yet been struck. The company is making regular shipments of high-grade ore assaying from 15 to 20% copper.

Butte, February 12.

NEVADA.

ESMERALDA COUNTY.

Active work on the Yellow Tiger, on company account, has been started and the electric company has turned on the current to the Yellow Tiger equipment.——H. B. Lind, president of the Nevada Hills Extension Co., has secured from George Wingfield a lease on the central part of the Booth ground. The block is 400 ft. long and the entire width of the claim, embracing the old Booth shaft. It is

along the westerly side of the Nighthawk property, which Mr. Lind, for his company, has under lease, and upon which he is now sinking a shaft.——The Las Vegas & Tonopah railroad has a force of men at work laying a spur track from its main line, crossing the C. O. D. property, to the Gold Bar lease. The spur will be about 400 ft. long. The Tonopah & Goldfield railroad is now figuring with the management of the Goldfield Annex lease regarding a proposed spur extending to the bins of that company, now operating on the Poleverde claim of the Jumbo Extension.

NYE COUNTY.

(Special Correspondence).—The Mayflower Extension Leasing Co. is opening milling ore on the 300-ft. level and keeping the mill busy. Connections have been made between the mine and the Mayflower Consolidated workings. ——The bondholders of the Homestake King Mining Co. have asked the courts to appoint a receiver for the property. An action to foreclose on the property to recover the indebtedness of $172,700 has been filed with Judge Averill of the District Court. A. S. Dingee, of Fort Worth, is the plaintiff, and represents the bondholders as trustee.—— The Crystal Bullfrog company is to double the capacity of its mill. A large amount of custom ore is awaiting treatment.——The Tonopah has erected an electric hoist at the Sand Grass shaft, which is down about 50 ft. The main Tonopah workings are producing at the rate of 3500 tons per week, practically all the ore coming from the Mizpah, Silver Top, and Valley View veins.——The Sphinx, at Round Mountain, will resume production as soon as the Daisy pipe-line can be cleared of ice.——The warm weather now prevailing at Manhattan has resulted in resumption of activities at most of the placers. The Wilson lease, on Wolftone Extension, continues to be one of the heaviest producers in the camp.——The San Francisco Placer Co. is arranging for extensive operations this spring.——The Barney Francisco lease, on Mustang Extension, and the Bisell lease, on September, are extracting excellent grade gravel. These companies have conducted operations throughout the winter, despite the cold weather.

Tonopah, February 12.

(Special Correspondence).—The new 10-stamp amalgamation and cyanide mill of the Eclipse Development Co. is well under way, the frame being covered and the concrete base for the batteries and other foundation work finished. This company has a four-year lease on the larger part of the Tramp Consolidated estate, embracing claims of the original Eclipse and Denver Bullfrog Annex companies that include the Eclipse and most of the Hobo or Tramp vein. From the outlet of the Eclipse adit on the south end of Bonanza mountain the ore will be trammed over a short trestle to the top of the mill, and discharged over a grizzly to a 10 by 16 in. crusher of Blake pattern. The product from crusher and grizzly drops into a bin from which it passes by automatic feeders to two 5-stamp batteries of Hendy pattern with low discharge. The screens used will be quite coarse. The discharge from the mortars pass over plates to the tailing reservoirs. In these reservoirs the tailing is dewatered and allowed to dry for a month or more, the sand being cultivated or stirred to render it friable and homogeneous, and to allow of as much oxidation as possible. From the bottoms of the reservoir tanks the sand is drawn off through screens to cars which transport it to standard tanks where it is treated by ordinary percolation. Any lumps or damp materials remaining on the screens are returned to the reservoirs for further stirring and aeration. The life of the lease allows the exploration of the lower levels of the Eclipse vein, from which portion the directors expect ore of better grade and uniformity than that heretofore found.

Rhyolite, February 12.

STOREY COUNTY.

A new 8-in. column pipe has been installed in the pump-compartment of the C. & C. shaft. T. F. McCormick is superintendent.——On the south end of the lode a drift is to be run from the 2100-ft. level of the Ward shaft toward the Yellow Jacket mine for 250 or 300 ft., and the workings tapped by diamond-drill holes and drained. One of the main features of the work is the unwatering of the 1700-ft. level of the Yellow Jacket where rich ore was found before the mine was flooded. It is expected to drain the lode 4000 ft. along its length and 400 ft. below the present water-level.

WHITE PINE COUNTY

The northwest cross-cut on the 400-ft. level of the Ely Consolidated opened a body of copper ore with a fair gold content. The north drift on the same level opened 6 ft. of ore. ——At the Chainman property James Willoughby and Neil McGill, operating the mine under lease, have started the two Chilean mills in the plant and are reported to be making a good saving.——The adit at the Ely Resurrection is in 150 ft., and it is the intention of the company to commence prospecting with a churn-drill in the spring.

NEW MEXICO.

OTERO COUNTY.

The Tularosa Copper Co., operating near Bent, is remodeling its mill and enlarging the plant to handle 100 tons per day. A hydro-electric plant is also being installed to furnish power for the mine and mill.

UTAH.

JUAB COUNTY.

(Special Correspondence).—The Colorado and Iron Blossom companies posted their first quarterly dividends last week. Colorado is to pay 10c. per share, aggregating $100,000, on March 20, and Iron Blossom will pay 8c. per share, aggregating $79,200, on March 30. Sioux Consolidated has not announced what its first quarterly dividend would be, but the directors have issued a financial statement covering the results of last year's operations. At the beginning of the year the company had a cash balance of $63,457.30, and the ore mined and marketed during 1909 amounted to $685,482.39. The total distributions, including $566,495.64 paid in dividends, amounted to $741,834.01, leaving a cash balance at the beginning of the year of $8105.68. The mine has been producing heavily since the first of the year, and it is presumed that there is sufficient money on hand to pay the regular dividend in March. On the 400-ft. level, 910 ft. of driving and 160 of raises has been completed; on the 450-ft. level, 682 ft. of driving and 222 of raises, practically all in ore; and on the second level, a drift to the west has been driven 600 ft. and cross-cuts 130 ft. have been run, but no ore opened. The company will not sink to greater depth unless more ore is found in the lower workings of the adjoining Iron Blossom property.

Tintic, February 12.

SALT LAKE COUNTY.

(Special Correspondence).—The Ohio Copper Co. is now treating between 1000 and 1100 tons of ore per day, though the management expects to run the first half of the mill, now completed, up to 1500 tons. The remainder of the mill cannot be completed until the company raises additional funds. The drawback to getting financiers interested is the fact that the Mascotte tunnel, through which the ores are mined and transported to the mill, is owned entirely by F. Augustus Heinze. Until the consent of Mr. Heinze is obtained to sell the tunnel for a reasonable sum, the owners of Ohio Copper are completely at his mercy.——E. P. Mathewson, general manager of the International Smelting plant, inspected the plant at the head of Pine canyon, and gave out a statement before leaving to the effect that the International would be ready to receive ores contracted for by April 1. The Utah Consolidated is to deliver from 1000 to 1200 tons of ore per day to the International plant.

Salt Lake, February 12.

CANADA.

BRITISH COLUMBIA.

(Special Correspondence).—The report of the Le Roi Mining Co. for the fiscal year ended September 30 is rather a favorable one when the limited operations of mine and smelter during that period are considered. The amount of ore taken from the mine while working amounted to 26,935 tons, which averaged 0.642 oz. gold, 0.33 oz. silver, and 0.85% copper, having an approximate value of $51.48 per ton.

During the year £34,026 8s. 9d. was written off—£20,712 7s. 1d. for exploration and development, £10,378 8s. 4d. depreciation of machinery, plant, etc., and £2935 13s. 4d. for sundry items.——The lessees of the Mayflower property have opened some good shipping ore and will make a small shipment to Trail smelter within a week or ten days.——A small shipment of gold ore was made from the I. X. L. property in the western part of the Rossland district, which is being worked under lease.——The situation at the Granby, Mother Lode, Snowshoe, and Oro Denoro, in the Phoenix district, remained unchanged during the past week, all four properties shipping ore to the smelter. The conciliation board will convene in Greenwood in a few days to settle the differences between the B. C. Copper Co. and its employees. About 35 men are working in the No. 7 mine of the Consolidated company, though work has not as yet been started on the tramway or concentrator.——The diamond-drilling on the Rawhide property of the New Dominion Copper Co. is giving good results, and buildings and machinery are being arranged with a view to starting shipments. The Brooklyn mine, belonging to the same company, will also be prospected by diamond-drilling.——The consulting engineer for the Hedley Gold Mining Co. states that the assays of 350 samples taken on the Nickel Plate mine show that there is about 130,000 tons of ore in sight at the property, of an average value of $12 per ton.——Permission has been granted the liquidator of the Dominion Copper Co. to call a meeting of creditors, by the Supreme Court, and the application of J. D. Spence and John Seward, of the New Dominion Copper Co., to have the liquidator discharged has been set aside. The application of the liquidator to be permitted to take action against the directors of the company in the Supreme Court of New York was held over.——Twenty-two men are now working in the Greenwood-Phoenix adit.——One of the shareholders in the Sullivan Group Mining Co. is suing the company for $500 that he paid for stock in 1906. He alleges that instead of having a cash deposit of $900, an operating profit of $138,000, and a net gain of $102,000, the company was bankrupt.——A new coal-washing plant will be installed at the Hosmer coal mines in the near future, at a figure of about $25,000.——On the group of copper claims being operated by the Tasso Harbor Mining & Smelting Co., on the west coast of Moresby island, it is reported the adit has been driven through ore for 225 ft.——The Ontario group has been bonded to Nelson capitalists for $60,000.——Near Massett, on Graham island, the diamond-drills have cut three seams of excellent coking and steam coal at the Queen Charlotte group, at 600-ft. depth, the thickest seam measuring 9 ft. 6 in.——J. A. Moore, president of the Irondale Smelting Co., has spent $60,000 for coal lands on Graham island, and $75,000 for a deposit of magnesite near Atlin. His company intends building a steel works on Vancouver island to treat the iron deposits there.——The Pacific Tin Mining & Smelting Co. intends building a $20,000 smelter near Nanaimo.——About $30,000 per month is being spent on the Britannia mine.

Rossland, February 11.

MEXICO.

CHIHUAHUA.

(Special Correspondence).—The Compañia Minera de Naica, the principal concern of the Naica district, will increase its reserve fund from ₱500,000 to ₱700,000, and devote the money to the erection of the proposed 600-ton smelter at Concho, a station on the main line of the National Railways. The plans include a total expenditure of ₱1,000,000. The company is producing from 300 to 400 tons per day, and shipping over 4000 tons per month. It has had great success and is a big dividend payer.——The American Smelting & Refining Co. is erecting two additional furnaces at its Chihuahua plant, and expects to have them ready to blow-in by the latter part of July. The two furnaces will raise the capacity of the plant to 750 tons per day.——A reorganization of the Veta Colorado Mining & Smelting Co. has been effected, and the 80-stamp mill and cyanide plant of that concern in the Parral district will be completed. The company owns the big Quebradillas and other properties. The enterprise has been at a standstill since 1907.——The Dolores Mines Co., operating the Dolores gold mines in western Chihuahua, is now paying dividends at the rate of 18% per year on a capitalization of $2,000,000. The production during the last three years totals over $3,000,000.——A contract for doubling the capacity of the smelter at the Rio Tinto copper mines in the Terrazas district has been let, and work will be started immediately. A 25-ton copper converter will be installed. The enterprise is controlled by Corrigan, McKinney & Co., of Cleveland.

Chinipas, Chihuahua.

Chihuahua, February 11.

GUANAJUATO.

(Special Correspondence).—The Guanajuato Reduction & Mines Co., which is operating exclusively on dump ore, has commenced to show profits of $10,000 per month above operating expenses and bond interest. The company recently built an electric line to give the mill connection with the Rayas property, and a big tonnage from the Rayas dumps is now being treated.——The Cubo Mining & Milling Co., of the Guanajuato district, has under consideration with the Peregrina Mining & Milling Co., the delivery of 200 tons of ore per day to the Peregrina plant. The Cubo company is now in shape to produce heavily.——The Flores de Oro Mining & Milling Co. has made the final payment on the San Luis Flores de Oro mines, in the La Luz camp, and is now planning the erection of a mill. The company has been developing with good success, and has sufficient ore in sight to justify the erection of a small plant.

Guanajuato, February 11.

SAN LUIS POTOSI.

(Special Correspondence).—The American Smelting & Refining Co. has secured control in the Matehuala district by the purchase of the properties of the National Metallurgical Co., an American concern organized in 1901 with a capital of $1,000,000. These include a custom smelter with a capacity of 550 tons per day, copper and lead-silver mines, and a water system that cost more than ₱350,000 and that supplies the town of Matehuala. The water system is of the utmost importance, as in former years the failure of water supplies often caused the temporary abandonment of the camp.

Matehuala, February 10.

SONORA.

(Special Correspondence).—The Pacific Smelting & Mining Co., the concern organized several months ago with a capital of $8,000,000 to take over the holdings of the Douglas Copper Co. and subsidiary companies, and the mines of the Mexican Exploration & Mining Co., is preparing to blow-in the custom smelter at Fundición, on the main line of the Southern Pacific extension, during the month of March. The smelter has a capacity of 350 tons per day, and it is expected to keep the plant in continuous operation on not less than 250 tons per day. Contracts for custom ores are being signed.——The 180-ton custom smelter of the Yaqui River Smelting & Refining Co., at Toledo, on the Yaqui river extension of the Southern Pacific, will be in operation at an early date, all preparations for blowing in having been made.

Fundicion, February 10.

Personal.

Professional men are invited to send news of their engagements and travels. Such news is interesting to friends.

L. A. GREENE is at Denver.

W. A. SCOTT is at Ray, Arizona.

A. E. DRUCKER is at Aberdeen, Washington.

GELASIO CAETANI has returned from Goldfield, Neveda.

WAYLAND H. YOUNG has returned to Oakland from Mexico.

C. M. FUELLER, of Los Angeles, is visiting San Francisco.

H. F. A. RIEBLING, of Denver, is in Wyoming on an examination trip.

EDWIN E. CHASE has gone to Houghton, Michigan, to examine copper mines.

HIRAM W. HIXON is lecturing on metallurgy at the University of Pennsylvania.

HENRY P. DUNBAR has moved to Plainfield, New Jersey, from Mammoth, California.

ELWOOD J. WILSON, of Goldfield, Nevada, is at the Stratford hotel in San Francisco.

S. R. TRENGOVE, of the Iron King mine, in Yavapai county, Arizona, recently was at Globe.

J. W. JUDD delivered the jubilee address before the Liverpool Geological Society, January 10.

JAMES DOUGLAS, of the Phelps-Dodge Co., was at the Old Dominion mine, Globe, Arizona, last week.

ARTHUR D. FOOTE, of Grass Valley, has been elected a director of the American Society of Civil Engineers.

R. B. LAMB is in Nicaragua, where he is making examinations for the C. L. Constant Co., of New York.

Sir WEETMAN PEARSON, Bart., head of the house of S. Pearson & Son, has sailed from England for Mexico.

W. S. SULLIVAN and HOWARD T. WAYNE, of Globe, Arizona, have become partners in mining engineering practice.

D. T. SWATLING, of the Commonwealth M. & M. Co., operating at Pearce, Arizona, is seriously ill in Los Angeles.

ALBERT JOHANNSEN has been appointed assistant professor of mineralogy and petrography at the University of Chicago.

GEORGE HOHAGEN has resigned his post as Director of the Mint at La Paz, Bolivia, and resumed practice as mining engineer.

W. G. RICE, president of the Superior & Boston Copper Co., was visiting the property of the company at Globe, Arizona, last week.

S. A. HEMPLE, of Valdez, Alaska, is at San Francisco in the interests of the Knight Island Copper Mining Co., of which he is president.

WILEY B. AKERS, formerly superintendent at the Rincon mine, Temascaltepec, Mexico, is at 51st street and Telegraph avenue, Oakland, California.

W. H. MCCORD, who has been at New York making contracts for the equipment of the mill to be built on the Tajo de Dolores mine at Guanajuato, is returning to Guanajuato this week.

WALTER HARVEY WEED has returned from Ely, Nevada, to New York, where he has completed his report upon the Ely Central property, which he examined in behalf of a committee of the largest stockholders.

E. K. SOPER has resigned his position as instructor in economic geology at Cornell University to take similar work in the Minnesota School of Mines. He may be addressed in care of the geological department of the University.

JOHN T. MILLIKEN, of St. Louis, president of the Golden Cycle Mining Co., of Cripple Creek, is at New York on business connected with the Cobalt Provincial Mines, Ltd., of Cobalt, of which he has recently secured control.

The San Francisco Section of the Mining & Metallurgical Society of America will meet following dinner at 6:30 p. m. at the Palace Hotel, February 21, instead of 22 as previously announced.

World's Silver Market in 1909.

The annual London letter by Pixley & Abell, dealing with the silver market of the world during 1909 is here given as being one of the most authorative statements available:

A feature of the year has been the comparative steadiness of the silver market. The average price of the year is 23 11-16d., the lowest on record, against 24 13-32d. in 1908 and 30 3-16d. in 1907. The previous lowest annual average was 24 1-16d. in 1902.

The improvement which took place during December, 1908, was continued during the early weeks of January, and the quotation rose from 23 3-16d., the opening price of the year, to 24⅜d. on the eighteenth of that month. From that point the market declined, mainly on sales by China, until, on March 4, 23 1-16d. was quoted. During March fluctuations were small, but April and the first week of May saw a steady improvement, due to purchases both by China and the Indian bazaars, which carried the quotations up to 24⅞d. The tendency was then again downward until early in July, when, at about 23½d., the market remained very steady, with insignificant fluctuations for a period of about seven weeks. From then there was a slight improvement to 24d., which was quoted on August 31, but during September and October the market sagged slowly, until, in November, prices steadied at about 23⅝d. During December, on important buying for the Continent and extensive covering by Indian speculators, there was decided improvement, which carried the quotation to 24 5-16.

Shipments to India, though less than in 1908, have continued on a large scale, and amount to about £6,750,000, while the stock held in Bombay is now £1,000,000, with nearly £500,000 on the water, against a stock of £400,000 and £840,000 in transit at the end of 1908. With the excellent crops of cotton and other produce in India, it is anticipated that there will be a large demand for silver for jewelry and hoarding during the coming year, though, judging from the increased shipments of gold to India during the last few months, it is probable that a greater proportion of gold than usual will absorb the savings of the people.

The speculation to which we referred last year continued until recently, and at one time it was estimated that Indian speculators had sold short on this market to the extent of £2,000,000. During the last few months, however, this has been largely liquidated, and the amount now open can be but trifling. This buying was probably the principal cause of the steadiness of the market during the later months.

China has been a larger and more important buyer this year than usual, though at times, when quotations have suited, she has sold freely. In addition to her operations on this market, she has also bought and sold largely in Bombay, while from San Francisco she has received upward of £1,500,000, against £1,100,000 in 1908. The low rates of exchange ruling in China have again adversely affected the import trade, while exports for the same reason have been stimulated. The country has been favored with excellent crops and the banks have been obliged to buy and import silver freely to pay for their exports. Shipments of silver from London to China during the year amount to nearly £2,000,000, against £821,000 in 1908, but these figures are not necessarily correct, for silver shipped to China from London is often diverted while in transit to India, while shipments to India are in the same way diverted to China. A few purchases have been made by the countries comprising the Latin Union, but purchases by the American, French, and Mexican governments have been insignificant.

Though it is always difficult to forecast the future of the market with any degree of confidence, yet it seems probable that apart from any unforeseen factor that may arise, the average price for the coming year will be somewhat higher than that of 1909. The general improvement in trade, which is now becoming evident the world over, especially in India and China, where silver plays a most important part, and the tendency of several States to increase the amounts of silver subsidiary coinage in circulation, and so relieve the pressure on their gold reserves with profit to themselves, should lead to a good general demand for silver during the year 1910.

Publications Received.

Any of the books noticed in these columns are for sale by, or can be procured from, the MINING AND SCIENTIFIC PRESS.

MEXICAN TRAILS. By Stanton Davis Kirkham. 8vo., pp. 293, Ill., Index. G. P. Putnam's Sons, New York, 1909. Price $1.75.

The author of 'Mexican Trails' journeyed to Mexico equipped with a facile pen, a camera, some knowledge of Spanish, and much charming enthusiasm. He describes in pleasing manner the trails over which he traveled and on which he camped for three years, and he faithfully portrays in word and picture which he calls the "real Mexico." He has experienced the beauty of her deserts and taken part in the life of her cities. He has seen the Republic in the one way to see a country—by tramping and riding over her highways and byways. Mr. Kirkham compliments President Diaz as "the most forceful character in Mexico—the Man of Iron. What is effected in Mexico today is the work of Porfirio Diaz. In himself the central power, reaching out to every State, and controlling it, this one man has established law and order, and maintained it as only a Man of Iron could." The pictures of the toiful lives of the native Mexicans, their many privations and their few joys, move to compassion, in spite of the author's assurance that these grown-up children are too simple to realize how poor they are. The unquenchable thirst of the collector is increased by descriptions of curious relics to be obtained in the 'Thieves' market' in the City, and which one occasionally runs across in out of the way places. A strange quest is 'Hunting Titians in a dugout'. The author does not present a flattering picture of Mexican theatres, Mexican music, hotels, or cookery. On these matters, however, there are differences of opinion. No doubt they are 'good for those who like them', but Mr. Kirkham did not happen to like them. There are charming descriptions of cathedrals scattered over New Spain, and attractive views of Mexican patios and gardens. An interesting chapter is on the potter and the pot. Another describes pilgrimages—wearisome and useless journeys in expiation of sin. Ancient ruins "worthy to be classed with the best work of antiquity" are adequately described. The author has cross-cut a pay-streak of humor in the chapter on a certain Gundalajara school where he tells of unwashed urchins gathering scraps of knowledge, while pigs, hens, and chickens wander in and pick up crumbs, the versatile *maestro* meanwhile varying his pedagogic vocation by shearing the locks of street-car conductors while car and passengers wait without the door. American writers on things Mexican might well consult a grammar more freely for Spanish phraseology, and a dictionary for Spanish orthography. One seldom picks up a book on Mexico without finding ignorance of the language exposed. The important subject of Mexican mines, the source of so much wealth, is lightly dwelt upon, as the author's intent was not to exploit the country, but to give a glimpse of the picturesque little cities of New Spain, and of the village life of the Indian people who were before New Spain. In this he has been wholly successful, and the volume can be heartily recommended to those who would travel through Mexico in imagination over unbeaten trails.

CEMENT RESOURCES OF VIRGINIA. By R. S. Bassler. Bull. 11-A, Virginia Geol. Surv. Pp. 309, ill. Charlottsville, 1909.

In this report the resources west of the Blue Ridge only are discussed. Studies looking to similar reports on the Piedmont and Coastal Plain regions are under way, and similar reports on them are promised later by T. L. Watson, the energetic director of the Virgina Survey. The present volume is introduced by a chapter on the materials and manufacture of hydraulic cements, by E. C. Eckel. This is followed by a particularly full and valuable description of the geology of the cement rocks, by Mr. Bassler. The work is authoritative and will doubtless prove of large service to people interested in the development of the region.

GRAPHITE AS A LUBRICANT. By Joseph Dixon Crucible Co. Pamphlet. Pp. 60. Jersey City, 1909.

This is the eleventh edition of a little handbook known to

all engineers. It has been revised and brought up to date and contains a great quantity of interesting information difficult to obtain elsewhere.

PROCEEDINGS OF THE SELECT STANDING COMMITTEE OF THE HOUSE OF COMMONS ON MINES AND MINERALS. Pp. 66. Public Printer, Ottawa, 1909.

The importance of the mineral industry of the Dominion was recently recognized by the constitution of a standing committee of the House of Commons. At the hearings of the committee there have been most interesting discussions of land laws, of administration, and various other topics relating to mining.

THIRTIETH ANNUAL REPORT OF THE DIRECTOR OF THE UNITED STATES GEOLOGICAL SURVEY, FOR THE YEAR ENDING JUNE 30, 1909. By George Otis Smith. U. S. Geol. Surv. Pp. 128. Maps. Washington, 1909.

An adminstrative report giving details of the work of this great organization.

TESTS OF RUN-OF-MINE AND BRIQUETTED COAL IN A LOCOMOTIVE BOILER. By W. T. Ray and Henry Kreisinger. U. S. Geol. Surv., Bull. 412. Pp. 32. Washington, 1909.

Commercial Paragraphs.

SPURR & COX, INC., have taken the management of Socorro Mines at Mogollon, New Mexico. W. Rowland Cox is at present at the property.

GELASIO CAETANI and ERROL MACBOYLE have taken offices in the Crocker building, San Francisco, and will engage in general consulting work.

T. H. PROSKE, Denver, Colorado, recently shipped to the Dolores Mines Co., Madera, Chihuahua, Mexico, a sectionalized Ajax drill sharpener for mule-back transportation.

E. B. SPALDING, C. E. SLOAN, and F. T. ROBSON have opened a civil and mining engineering office at 802 Union Trust building under the firm name of Spalding, Sloan & Robson.

The HENDRYX CYANIDE MACHINERY CO., Denver, Colorado, advises that Wilbur A. Hendryx, its manager, is at Newmire, Colorado, installing an 8-ft. combination agitator and filter for the Primos Chemical Co., for use in treating vanadium ore.

The PACIFIC FOUNDRY CO., San Francisco, reports the shipment of four Kilker's matte tapping cars to the Consolidated Arizona Smelting Co., Humboldt, Arizona. This device is indeed, as the manufacturers claim, meeting with enthusiastic approval all over the country.

THOMAS J. JONES has moved to San Francisco after some years service as general mining superintendent for the Mountain Copper Co., and while retaining a place on the staff of Lewis T. Wright, will engage in general practice as a mining engineer, with an office at 150 Pine Street.

The annual conference of managers and agents of the INGERSOLL RAND CO., was held from February 1 to 5. A trip of inspection included one day each at the Easton, Pennsylvania, the Phillipsburg, New Jersey, and the Painted Post, New York, plants of the company. The last two days were devoted to business meetings at the Astor hotel in New York City. A banquet and theatre party closed the conference. Representatives from all parts of this country and from England, France, Italy, Mexico, and Canada were present.

THE JEFFREY MFG. CO., held its annual sales convention of the Mining Department at Columbus, February 3 and 4. The program included numerous inspection trips and tests as well as speeches and discussions by the officers of the company and district managers. An interesting and stimulating little booklet commemorative of the event is being distributed. Among the many good things in it, the following bits of philosophy will bear repetition: "The man who has nothing to advertise has nothing to sell." "Advertising is salesmanship plus publicity." "The man who is satisfied with what comes to him unsolicited answers few knocks at the door."

The Prospector.

This department makes a charge of 25 cents to subscribers not in arrears and $3 to non-subscribers for each determination. To ensure promptness in publication of the determinations, payment must be forwarded with specimens.

T. J. R., Hornitos, California: Quartzite.

H. W., Burrough, California: Albite granite.

F. P., Octave, Arizona: Specular hematite in quartz.

R. C. M., Amador City, California: Massive arsenopyrite mixed with quartz.

T. C. C., Atlanta, Idaho: No. 1, serpentine; No. 2, black serpentinized diorite or gabbro.

W. H. S., Eureka, California: No. 1, quartzite rock containing pyrite oxidized to limonite; No. 2, decomposed mica schist.

J. H. P., Golcondo, Nevada: No. 1, mineralized feldspathic rock with much pyrite; No. 2, altered shale; No. 3, altered schist; No. 4, altered amphibolite; No. 5, altered schist; No. 6, altered anthophyllite schist; No. 7, feldspathic rock; No. 8, similar to No. 7. These rocks have lost their original character by metamorphism and kaolinization.

V. G., Promontorio, Mexico: No. 1, rhyolite or quartz porphyry; No. 2, same as No. 1, with veinlets of serpentine; No. 3, 4, and 5, same as No. 1 and 2, somewhat kaolinized; No. 6, calcite and pyrite with brown umber formed by the oxidation of the pyrite; No. 7, granodiorite; No. 8, rock kaolinized by the action of decomposing sulphides.

Dividends.

On Friday, February 4, the Bunker Hill & Sullivan M. & C. Co. paid dividend No. 149 of $60,000. This makes the amount of dividends paid since January 1, 1910, $105,000, and the total to date $11,391,000.

L. VOGELSTEIN & Co. give the following figures of German consumption of foreign copper for the year 1909:

	Tons.
Imports of copper	157,795
Exports of copper	8,053
Consumption of copper	149,742

as compared with consumption during the year 1908 of 151,715 tons. Of the above quantity 143,717 tons were imported from the United States.

EDITORIAL.

LOS ANGELES is to entertain the American Mining Congress this year, but the whole of California will extend a welcome. We can assure the members and delegates that they will be well entertained by our sister city.

GOLD production for the world in 1909 is now ascertained to have been approximately 22,200,000 fine ounces. On January 1 we predicted a slight excess over 22 million. We assumed, however, that Mexico would show a decrease, whereas reports to date demonstrate an increase from 1,082,210 ounces in 1908 to at least 1,250,000 last year.

OPPONENTS of the Bureau of Mines now urge that there is no necessity for such an organization since the United States Geological Survey is doing already the work that is proper to such a bureau. This is interesting since many of these same opponents have previously argued that the Geological Survey should confine its work to geology and let technology alone.

SUGAR once broke the 'Solid South', when Louisiana saw her interests threatened. Now Los Angeles, through its Chamber of Commerce, declares for an open door to Chinese and Japanese immigrants. Hands are scarce for picking the golden orange. Thus theories fade under the strong light of necessity, and even race-prejudice weakens. If the pro-Oriental spirit should finally prevail in the West, it would produce great changes in the operation of the mines.

ALUMINUM seems not to be coming into more extended use despite the low price of the metal, which is now selling in Europe on a parity with copper. The depression in the market is due to active competition on the one side, the efforts to effect a great aluminum trust having failed, and on the other to the knowledge that a great demand for purposes where it could supplant copper would immediately force up the quotations to prohibitory figures. The ore reserves suitable for the manufacture of aluminum by the existing process are too small to admit of sustained production on a scale commensurate with copper.

EXPECTATIONS are apparently well founded that the 'oil-war' in Mexico between S. Pearson & Son and the Waters Pierce Oil Company, will terminate soon after the arrival of Sir Weetman Pearson, who is now on his way from England to Mexico. The contest has been so bitter that oil is selling, even at a considerable distance from the railroads, for less than the cost of production and refining. The com-

pany of which Sir Weetman is the head has been constructing a railroad, and a pipe-line having a capacity of 12,000 barrels of oil per diem, to bring oil from the Furbero fields to Tuxpám, and thence to the refinery at Minatitlán. These improvements are just being completed. It is thought that S. Pearson & Son now consider that they have reached a point where they can cease importing crude oil with which to fulfil their contracts, and that adjustment between the rival concerns may be reached.

GERMAN commercial aggression, cutting into markets that would prove open to Americans if sufficient enterprise were displayed in taking advantage of them, is again shown by the establishment of a fast mail and passenger service between Callao, Peru, and Europe. New vessels of the Kosmos line have been put on the West Coast run, having a register of 14,000 tons. Passengers are transferred at Valparaiso, Chile, and taken by rail to Buenos Aires, Argentine Republic, where close connection is made with other steamers of the same company for trans-Atlantic ports. Twelve days are saved by this arrangement, as against the old Magellan route.

KIMBERLY, Nevada, was the scene of a rich discovery last week. The Battle Mountain region has long been known for small bodies of high-grade, free-milling gold ore. Last summer at Bannock very rich ore was discovered by Mr. Alexander Walker, and the vein is now being mined by the Nevada-Omaha Mining & Milling Company. The geology of the deposits was described by Mr. C. S. Thomas in the MINING AND SCIENTIFIC PRESS December 18. So far, doubt of the ultimate value of the deposits has rested on the known 'spotted' character of the high-grade ore and the presence in at least some cases of unaltered sulphides at shallow depth. Irregular distribution is natural in the case of rich ore, and has not proved elsewhere a sufficient obstacle to development. As to the sulphides, it is probably fair to say that too little is yet known to warrant final decision as to the value of the deposits. Kimberly and Battle Mountain are likely to be the focus of considerable excitement this year.

SOMEWHAT misleading accounts have been published in the daily newspapers concerning the recent decision of Judge F. J. Murasky in San Francisco in the case of James R. Ainsa, B. V. García, *et al.*, against the Alvinza Hayward estate and others, involving a controversy over a concession to coal lands in Sonora, Mexico. Confiscation of the coal lands has been carelessly alleged, and it has been stated that the decision exonerates the stockholders from liability for the disappearance of assets which constituted the security for bonds issued in payment for the property. The truth seems to be that certain citizens of Mexico, holding a concession for approximately one million acres of supposed coal lands in the districts of Urés, Hermosillo, Guaymas, and Alamos, in the State of Sonora, assigned these rights to a corporation organized under the laws of Arizona, accepting bonds of the corporation in payment for the lands. The bonds were coupled with an agreement as to exploration and development of the coal deposits. The organizers of the company spent more than $200,000 in such explorations. As a result it appeared to them impracticable to make a financial success of the enterprise. They therefore abandoned it, and allowed the concessions to lapse by non-payment of taxes. The contest involved many complications, but in effect the effort was to recover the face value of the bonds, on the ground that the company, in allowing the property to revert to the Mexican Government, had not kept faith with the bond-holders. The case was decided against the plaintiffs.

Labor Troubles at Butte.

Butte is disturbed at present by labor troubles. Not that this is unusual; indeed it has been growing chronic. This time, however, Butte seems seriously disturbed. Many of the great mines are closed; for a time there was real danger of their being flooded and the horses underground starved; the Butte Reduction Works were temporarily short of ore; and at Anaconda, the Mill & Smelterman's Union having sternly resolved to handle no tainted ore, that great smelter may be forced to close. One might suppose that a life and death struggle were in prospect between the 'dread oppressor' and the 'wage slaves'. Apparently, however, the 'capitalistic classes' in this case have nothing to do with the matter—except to patiently act the part of innocent bystander while the air is full of flying brickbats. In other words, this is a fight over jurisdiction between two Unions, the Western Federation of Miners and the International Engineers. Trouble has been brewing for some time, and was finally focused over the discharge, at the demand of the Western Federation, of an oiler belonging to the International Engineers. The Federation, in the language of the Anaconda Mill & Smelterman's Union No. 117 does "not and can not recognize the pretended membership of the International Engineers Union No. 138 as a bona fide labor organization or entitled to any consideration as a labor organization within the jurisdiction of the Western Federation of Miners." The Federation men, considering the Engineers as out of the pale, refused to work with them, and hence the trouble. It happens that the International Engineers, while numerically weak at Butte, includes the high-class men who handle the big first-motion hoisting engines. Elsewhere the Union is strong, and it is quite competent to make a vigorous fight. At one time all the Boston & Montana mines, the Clark properties, the Red Metal, Parrot, Davis-Daly, and Alex Scott mines were closed, and on February 17 less than 1000 men were at work. The carpenters, blacksmiths, machinists, pumpmen, ropemen, and electricians employed about the mines, are affiliated with the International Engineers and are said to be ready to go out if necessary to support them. The companies affected have demanded that the Federation furnish engineers to take the place of the strikers. This the miners have undertaken to do and have in part accomplished. The Original and Stewart mines resumed work on Wednesday, and the High Ore was expected soon to follow. The Miners Union has the advantage over the Engineers in holding a two years' contract with the leading companies. Clearly, however, unless it

prove able to man the hoists the contracts will not amount to much. The Western Federation has not worked cordially with other unions, and in a long-drawn fight the sympathy of union as well as non-union men elsewhere is likely to go against it. Since the Homestake resumed work on a non-union basis Butte is the last great stronghold of the Western Federation. It has seemed clear for some time that it would need to change its policy materially or it would lose its hold altogether. At Butte there has been a growing irritation, and the last year has been marked especially by many small strikes and interruptions to work. The Miners Union, being locally dominant, inevitably suffers from this, whether responsible or not. The Federation wisely refused to interfere in the matter of the switchmen's strike, though in that case the operators called on it for aid necessary to the operation of the mines. As the leader among local unions, the public justly or unjustly blames it for all interruptions of industry. It would seem the better part of wisdom under such conditions to conciliate rather than antagonize other unions. It is an open secret that the mine managers are restive under the dictation of the Federation, and would welcome an opportunity to drive it out of the district. A lively fight between the two unions would not only afford an excellent excuse, but would necessitate the bringing in of troops to preserve order; and it has been abundantly proved that where non-union miners can be protected in their right to work, the Western Federation of Miners withers. Just how seriously the situation is regarded is indicated by the fact that Mr. B. B. Thayer of New York has gone to Butte, as has also the president of the International Engineers. While the situation seems just now to be improving, the extent to which the trouble will spread is still uncertain. The situation is undeniably serious.

Railroads and the Metals.

Revival of business in 1909 could hardly be better shown than by the receipts of the railroads. The common carriers draw revenue from all classes of industry, and therefore constitute one of the best gauges of prosperity. Hence it is peculiarly significant to find that the gross earnings show an increase of approximately $285,000,000 over those for 1908, the total gross receipts of the roads in the United States for the former period amounting to $2,696,786,500, on 238,073 miles of track. It is also noteworthy that this total railway income is the largest ever recorded in the history of the country, and that the rate of increase is also the largest ever reached, being 11.78 per cent. The gain, moreover, represents a steady growth, beginning relatively small in January, and progressing steadily month by month throughout the year. The chief source of these gains in revenue was the phenomenally great movement of iron ore and of the output of the iron and steel industry, followed closely by coal and coke. No increase of traffic due to agricultural products was observed, the amount of this freight remaining about the same as during the past three years, with a slight shrinkage in cotton shipments. The independence of agriculture as related to the general business of the country is a striking feature of recent economic history in the United States, some important bearings of which, as a factor in determining prices, having been pointed out before in these columns.

Further examination of the returns from the railroads, however, shows that the West has added its share to the general prosperity. The Santa Fe, Denver & Rio Grande, and Union Pacific all reveal larger gross incomes than they had ever before enjoyed. The income of the Southern Pacific also came within five million dollars of the receipts during its banner year of 1907. This has been due in equal measure to contributions from the mines and the farms. The new issues of railroad stocks and bonds, therefore, represent a provision for future growth, not a 'capitalization of losses', to use a modern expression.

Development of the iron industry is always significant to the West, owing to the intimate correspondence existing between the production of that metal and the demand for copper and lead. The year 1909 witnessed the largest output of iron and steel yet attained, and the new business now being booked is evidence of continued prosperity, which promises to cause the output during 1910 to surpass that of the previous year. The Steel Corporation is averaging nearly 35,000 tons of new business per day, much of it coming from the railroads. Orders for 10,000 cars were placed in one week, with others pending for upward of 40,000. More steel than heretofore is also going into buildings all over the country, and large contracts for structural material are being made daily. Such a condition necessarily augments the consumption of copper, so that the excess of purchases of the red metal over the present capacity of the mines and smelters is not surprising. The recent depression in the market price of Steel common stock had nothing to do with production, either present or prospective. The great depression in Steel stock was caused by a single operator suddenly throwing 400,000 shares upon the market. The same operator, holding an additional 200,000 shares, placed these with a brokerage firm which found itself embarrassed with so large a proportion of such collateral as to necessitate further sales in order to liquidate. The resultant depression had no close connection with actual industrial conditions.

The Steel Corporation is supposed to possess an advantage over the independent steel-makers of not less than $2 per ton. A considerable part of this results from its ownership of two of the three Minnesota ore-roads, over which is shipped the bulk of the ore-supply for the independents. The charges are from 80 cents to $1 per ton, against an operating cost of not over 40 cents. The Steel Corporation is thus taking toll from its rivals equivalent to a profit of about 50 cents per ton on the independent output.

So great has been the revival of trade that the Corporation finds its own furnaces incapable of satisfying the demands of the finishing mills, and it has been obliged to resort to the outside market, purchasing from the Bessemer Pig Iron Association. In the face of such evidences of prosperity on the part of the railroads and of the steel manufacturers, no doubt of a steady growth in consumption of the other metals can remain, and a gradual increase in prices is inevitable.

Geological Distribution of the Precious Metals in Colorado.—III.

Written for the MINING AND SCIENTIFIC PRESS
By T. A. RICKARD.

*Seven localities (14 to 18, also 56 and 57) are quoted as belonging to the Cripple Creek district; the lode formation presents interesting differences, due more to the structure than to the composition of the various eruptives. Cripple Creek, although an isolated area when regarded as a rich mining district, is yet an outlying portion of the much larger volcanic region lying to the southwest. Geologically, it is part of the Silver Cliff and Rosita districts and owes its origin to eruptive activities that were contemporaneous in occurrence and similar in character. The andesite breccia that predominates in the Cripple Creek district is late Eocene or early Miocene, but the dike-rocks penetrating the breccia are even younger, while the granite forming the basal formation of the district is older than the Cambrian. Rich gold veins occur equally in the oldest and in the youngest formations. The Cripple Creek district represents the ground-floor of a volcano, the superstructure of which has been removed by erosion.[1] There was more than one vent and there were many periods of eruptive activity, represented by fragmentary granite, andesite breccia, flows of andesite, then phonolite, nepheline syenite, and finally dikes of basalt. At the close of this vulcanism, thermal activity supervened. Evidence of the conduits through which the hot mineral waters ascended is to be seen today, particularly in the Deerhorn and Summit mines. But an economically more important proof of a long period of mineralization is given by the ore deposits formed by means of the action of solutions that ascended to the surface at the close of the successive volcanic periods. They healed the fractures with golden ore.

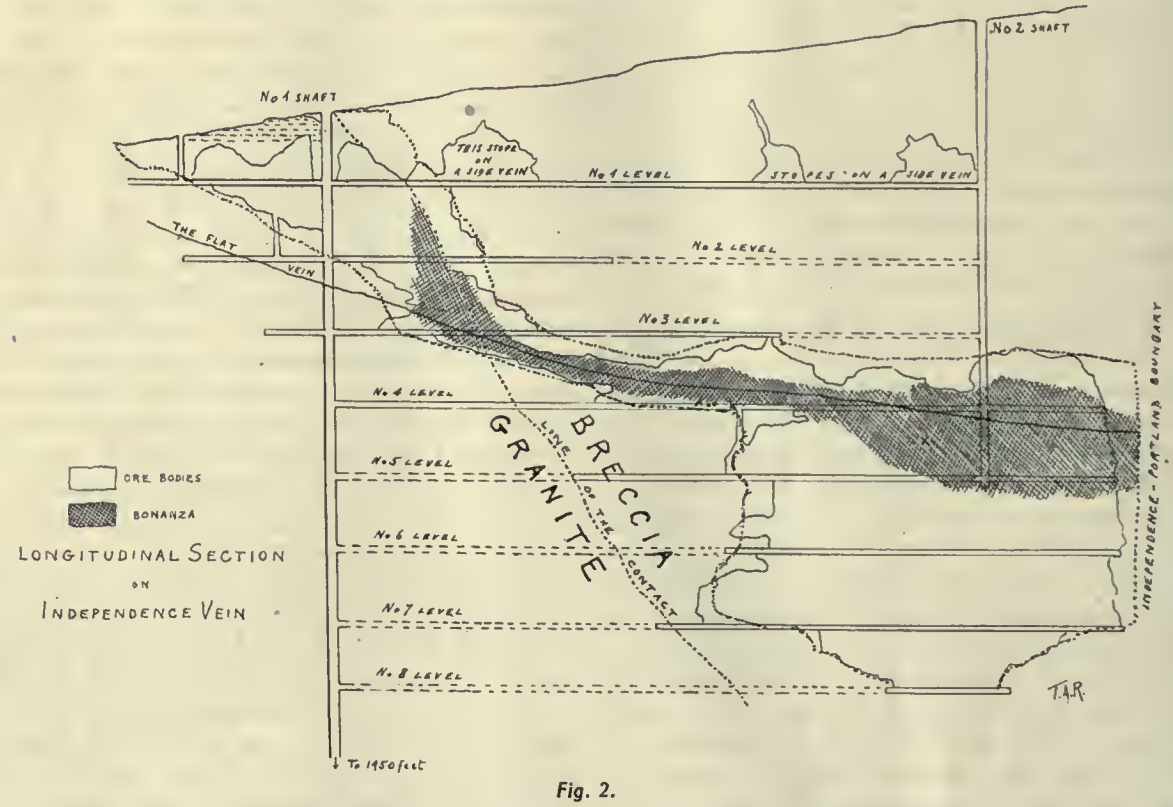

Fig. 2.

Everywhere in this district the distribution of the ore is modified by structural conditions, due mainly to dikes and other forms of intrusive rock. Thus, the Elkton represents the conditions characteristic of Raven hill. In this mine the rich ore follows one or both walls of a basalt dike about 4 ft. wide that penetrates the andesite breccia. The latter is itself brec-

*The numbers in the text refer to the table appearing in the first article of this series. MINING AND SCIENTIFIC PRESS, January 8.

ciated, that is, the fragmentary rock after becoming consolidated has been shattered by the rupture that made a way for the nepheline basalt. The ore is a replacement in both the breccia and the basalt, along the contact that granted a passage to the mineral solutions. A dike of phonolite crosses the basalt. The line of fracture that constitutes the Elkton vein extends beyond the basalt dike when the latter deviates in its course, showing how the vein-fracture

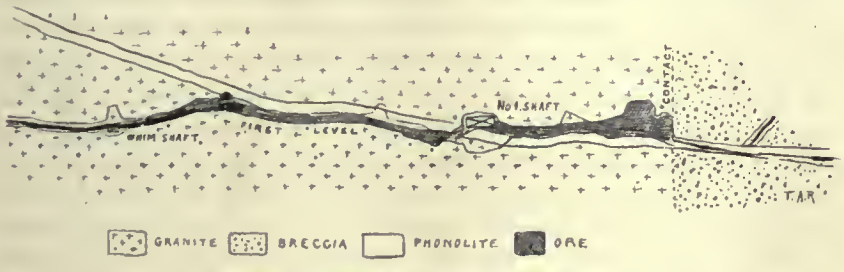

Fig. 3. Independence Vein and Dike.

was subsequent to the basalt and followed it where a line of least resistance was offered. But the richest ore occurs where the vein-fracture coincides with the basalt, for there the physical and chemical conditions were most favorable to the precipitation of the gold-bearing minerals, chiefly tellurides, such as sylvanite and calaverite.

Another example of the dependence of ore deposition upon structural conditions is shown by the Harrison vein in the Golden Cycle mine, on the southwestern slope of Bull hill. Here a large intrusive body of trachytic phonolite is traversed by dikes of phonolite that have shattered the older rock; along these bands of shattered rock the ore has been precipitated, the best of it occurring as a leader or persistent streak of very rich mineral flanked by mineralized and bleached country of a variable width. The greatest width of ore is found at places where subordinate veins join the main lode; this gives the orebodies a disconnected character, so that they seem like a series of linked enlargements. When the orebody dwindles, the line of the lode becomes indistinct, being then represented by a group of irregular fractures scarcely different from those to be seen in any cross-cut, and unrecognizable as 'veins' simply because they are unaccompanied by gold-bearing minerals.

On the lower slips of Battle Mtn. are the Independence and Portland, the two most famous mines of Cripple Creek. In their geological conditions they typify the district, especially the disregard for the relative age of the formation, provided the structural conditions were otherwise favorable. In these mines rich ore is broken equally in granite and in phonolite, in the Algonkian and the Eocene rock. The Independence mine is on the rim of the basin that marks the eroded hollow of the volcanic crater —the crater that is now plugged with a complex of breccia and lava. The four or five veins that constitute the lode-channel of the Independence mine have a strike that leads them out of the inner andesite breccia of Battle Mtn. into the outer granite of the surrounding country. And it is near the crossing of the vein from the one formation to the other that the bonanzas have been found. This is not surprising, for at the rim of the vent there were abundant facilities for the circulation of the mineralizing waters; the rock on both sides is shattered and penetrated by dikes belonging to successive periods of shifting and unrest, from the earliest andesite to the youngest basalt. However, the characteristic occurrence of ore in the Independence is that along a dike of phonolite, which is itself enriched by ore, but to a degree less intense than the rock it penetrates, namely, andesite breccia and granite. The ore consists of altered rock alongside the dike, and more rarely within the dike or even across it when the line of fracture of the vein has necessitated a deviation from the course of the dike. Where the phonolite, which is fine-grained and hard, is enriched it is usually along the seams produced by a sheeted fracturing parallel to the walls of the dike; in the breccia, which is coarsely granular and spotty, the rich ore occurs as an impregnation following fractures; in the granite, mica has been removed and in its stead

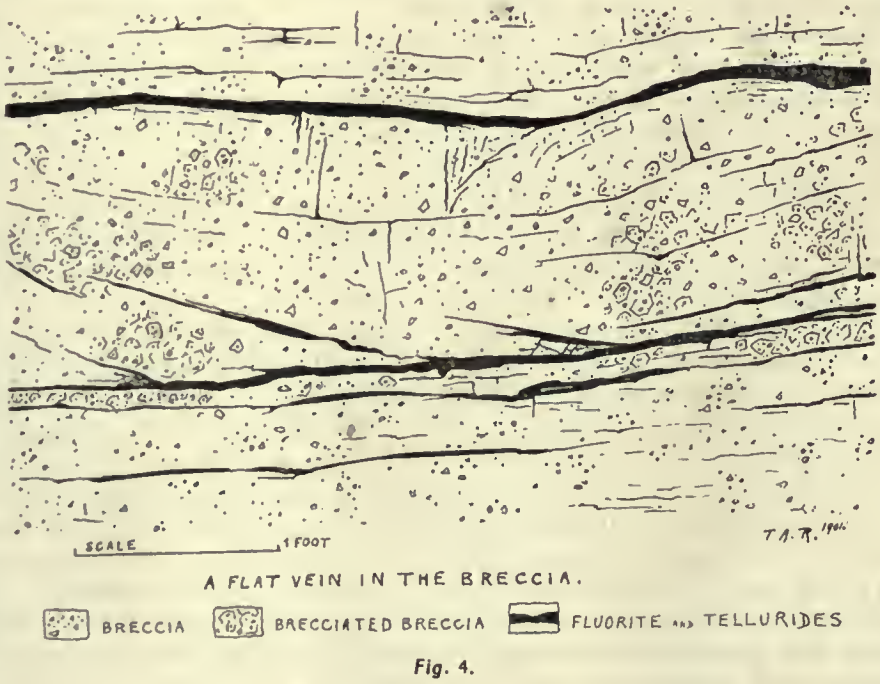

Fig. 4.

is green chlorite, fluorite also is present, and secondary hydrous quartz fills the interstices of the original constituents; only the orthoclase survives the general disintegration of the rock. A thread of quartz sometimes marks the centre of the vein when in granite; at a distance the lode appears as a distinct broad (4 or 5 ft.) band of iron-stained granite, and it is only by close examination that the boundaries are seen to consist not of 'walls' or selvages but

of a definite transition from decomposed into undecomposed granite. The richest part of the mine coincides with a flat vein having a dip that produces a scissors-crossing with the contact between the granite and the overlying breccia, as shown in Fig. 2. This flat vein is shown in detail in Fig. 4. In places it was fabulously rich, consisting of two or three inches of almost solid sylvanite and calaverite.

On Squaw mountain and Beacon hill the veins are in the outer granite of the Cripple Creek district, but even there they are closely related to dikes of phonolite and basalt. In the Orizaba vein of the El Paso Consolidated mine, the rich ore is distributed with reference to sheets of phonolite that the vein-fracture crosses, so that the pitch of the ore-shoots coincides roughly with the dip of the intersection of the vein-fracture with the phonolite. At the crossing the vein faults the phonolite (which is 9 to 11 ft. thick), and in the jagged break there are found a number of cavities lined with long prismatic crystals of sylvanite, encrusted with quartz, of great beauty and richness. The tellurides also impregnate the rock encasing the fracture, both in the phonolite and the granite, but the most productive portions of the mine are in or near the phonolite. In this case, as elsewhere in the district, the distribution of ore seems to have been affected not by the relative age, nor even the composition, of the rock, but by the physical conditions produced by lines of fracture connected with eruptive activity. The impregnation of the rock by gold-bearing minerals has varied in character with the texture and composition of the various rocks, but the choice of a place for deposition appears to have depended mainly on structural conditions.

The youngest sedimentary formation in which gold and silver ore has been found is the conglomerate underlying the breccias and lavas of the San Juan region. This conglomerate is of early Eocene age and lies unconformably upon the Mesozoic rocks. Originally called the San Miguel formation, it is now known as the Telluride, from the mining district where it finds its greatest development. Varying in texture, it is coarse when a thin bed, and a fine-grained grit when it attains any thickness; this ranges from 200 ft. to a maximum of 1000 ft. In Canyon creek, above Ouray, in Bear Creek (20), near Telluride, and on Silver Mtn., at Ophir (21), this conglomerate is traversed by veins rich enough to have undergone exploitation by mining. The only mine that has been operated with notable success, and on any scale, is the Contention. Here gold is found in a fault-fissure having a throw of 58 ft. and accompanied by crushed country, that is, the ore is essentially rock in place, with a variable addition of secondary quartz, bounded by selvages. A good cross-section is exposed along the face of a steep mountain-side. The mine workings follow the vein from the conglomerate into the overlying andesite breccia; the best ore was in the conglomerate near its base, where it lies on a Jurassic sandstone. For a width of 30 inches the vein averaged $8 to $8.50 per ton. At a higher level the vein becomes poorer; in the breccia, it narrows and the valuable portions are more erratic. In descending, the Contention vein becomes unprofitable in the Jurassic sandstone and shale, and the evidence is such as to discourage exploration. The veins that penetrate the same conglomerate on Silver Mtn. (21) are similar to the Contention. The ore of the Golden Crown mine, for example, is "largely decomposed impregnated conglomerate, and little vein quartz is to be seen."[2] Here the conglomerate outcrops with a thickness of 300 to 400 ft. for a distance of several thousand feet, and is a grit held together by a porous cement. Thus it was easily impregnated by mineral solutions that followed fault-fractures coming through the underlying formation and reaching into the overlying breccias of the San Juan series. The geological interest of these veins in the conglomerate transcends their economic value, for mining operations have practically ceased, while the scientific importance of the occurrence is emphasized by the fact that the greatest goldfield ever developed by man is based upon the occurrence of gold-bearing quartz in conglomerate. I refer, of course, to the 'banket' of the Transvaal.

In Gunnison county there are several groups of mines that are geologically in the Cretaceous. At Irwin (22) this formation is represented by the sandstone, shale, and conglomerate of the Ruby formation, which is traversed by many veins, some of which yielded a large amount of rich silver ore nearly 25 years ago. The Ruby Chief vein is typical; it follows a fault-fissure, marked by two feet of broken rock and a band of quartz, streaked with arsenical pyrite. Ruby silver and stephanite occur in this quartz, which is from 6 inches to one foot wide. Between this leader of quartz and the nearly vertical hanging wall is brecciated country, containing stringers of quartz and speckled with arsenical pyrite. The best ore was obtained from this vein where it passes into a bed of conglomerate; so here again we have an example of precious-metal mining in conglomerate; but the Contention yielded gold, while the Ruby Chief is essentially a silver vein. It remains to add that porphyrite occurs in the vicinity, as an intrusive sheet following the bedding of the sedimentaries.

On Gold Hill, a few hundred feet below the workings of the American Nettie, already described (27), there are mines in another geological terrain, namely the McElmo formation of the Jurassic, just above the La Plata sandstone. In the Bright Diamond and the Ironclad (30) mines, the ore is found in a fine-grained, dark-blue limestone, 10 to 15 ft. thick, overlain by green shale that has been altered by intrusions of monzonite-porphyry so that it has become an argillite heavily charged with epidote and other metamorphic minerals.[3] The orebodies lie flat, conforming to the stratification and in close contact with the shale roof. Cross-fractures fault the ore and the limestone as much as 10 ft. In the Bright Diamond there is a porphyry dike 10 to 30 ft. thick north of the ore-bearing tract. The metamorphic effects of the irruptive porphyry do not appear to have affected the limestone. The ore is an intimate mixture of granular magnetite and pyrite, with a little chalcopyrite,

[2] C. W. Purington. 'Telluride Quadrangle'. Page 845.

[3] J. D. Irving. 'Contributions to Economic Geology'. 1904. Page. 73.

together with epidote, actinolite, garnet, quartz, and calcite. The discovery of the ore-measures was due to prospecting on a large fault-fissure vein that crosses the limestone. The ore carries $10 to $14 in gold, but in the mill it is difficult to concentrate. In a neighboring sub-district, called Camp Paquin (30), a limestone of the same formation is exploited. In the Newsboy the limestone is 5 to 7 ft. thick and the ore occurs in flat masses that generally occupy the full thickness of the limestone for a distance of 5 to 30 ft. from vertical fissures. In the Pony Express the same limestone is 30 ft. thick and the orebodies are much

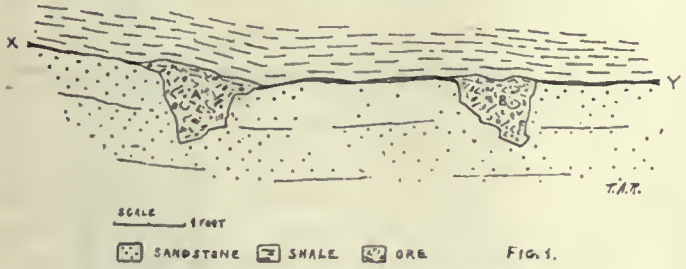

Fig. 5. Pockets of Ore in American-Nettie Mine.

thicker and more extensive. They reach into the hill for 1000 ft. along the strike of the vertical vein and spread out for 100 ft. The ore is sometimes the full 30 ft. of the limestone, but more usually from 8 to 10 ft. thick. It is richest immediately under the roof, which is shale. The ore is valuable chiefly for silver and is said to average about $30 per ton.

While most of the mines of the Silverton district exploit lodes in the San Juan breccia (11 and 12),

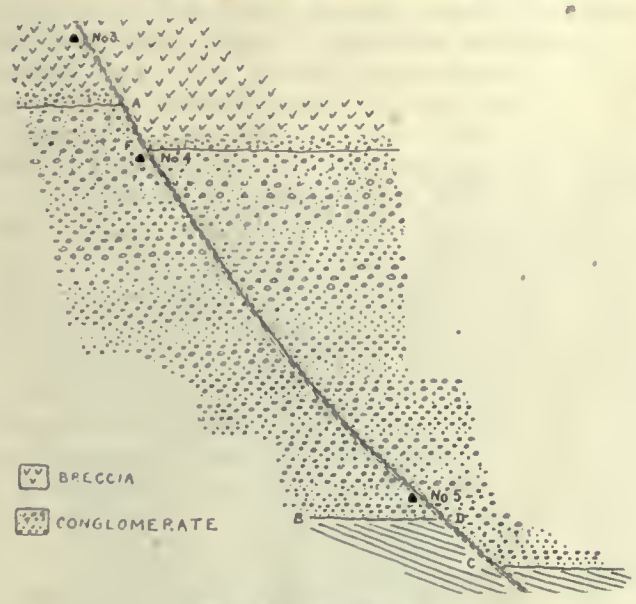

Fig. 6. Contention Lode.

which is Tertiary, there are gold veins in the same district that are mined in a hornblende-schist of pre-Cambrian or Algonkian age (58). In Cunningham gulch the lodes traverse both the schist and the breccia. The Highland Mary is typical; this vein is from 2 to 3 ft. wide, and appears as "a simple quartz-filled fissure" within well-marked walls, to which the quartz adheres or is 'frozen'. Galena and tetrahedrite characterizes the rich ore. When the vein passes upward into the breccia, it becomes much wider, but consists of barren quartz. In the neighboring Green Mountain mine, the schist underlies a rhyolitic flow-breccia. In the rhyolite the vein is about 3 ft. wide and is a simple fissure, containing small inclusions of the encasing country. The ore carries galena and sphalerite in quartz. In the schist the vein is a little wider and occupies a clear-cut fissure, the quartz being 'frozen' to the clean edges of the encasing rock. Pay-ore was broken from the vein where it traverses both formations, and the difference in the country

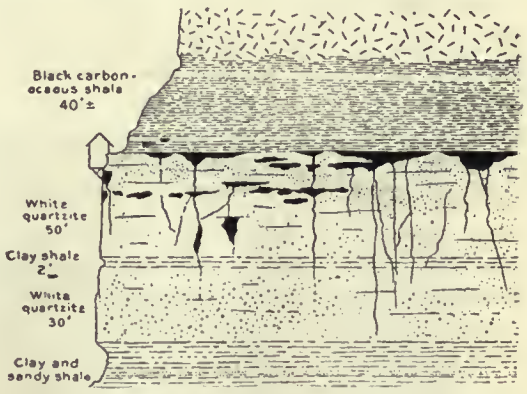

Fig. 7.

does not seem to have had any marked effect on the richness of the ore.[4]

In the Mt. Wilson district the veins penetrate both diorite (1) and the black shale of the Mancos formation (24) into which the diorite has thrust itself.

Fig. 8. Ruby Chief Vein.

Usually the veins are richer in the diorite than the shale, but in the San Bernardino, Badger, and American Frenchman mines, orebodies rich in silver occur in the veins when wholly within the shale.[5]

It has been noted that the Contention (20) vein passes from the Telluride conglomerate into Jurassic sandstone, only to die out. A few miles to the north, just above the town of Telluride, there are veins (28) that have been mined profitably in the same series of

[4]F. L. Ransome. 'The Silverton Quadrangle'. Pp. 167-169.

Jurassic sandstone and shale, constituting the McElmo formation.
